Transportation.—The railroad mileage in the State is 1,366.07. The Pennsylvania and Baltimore & Ohio systems own the greater part of it. The first railroad in the United States, and on which the first locomotive was run, was built in 1830 between Baltimore and Ellicott City. The first line of telegraph in the United States was constructed and operated in 1844 between Baltimore and Washington. There are 35 lines of railway, either centring or passing through Baltimore, or directly or indirectly, in connection with other roads, furnishing means of constant and rapid communication and intercourse with all the large cities of the Union and to every section of the country. Sixteen steamship and steamboat lines connect Baltimore with domestic and foreign ports.

Commerce.—The imports of merchandise at the port of Baltimore for 1900 aggregated in value, \$19,688,476; and the exports, \$111,462,168; giving a total foreign trade of \$131,150,644. The principal articles of export were oysters, tobacco, coal, petroleum, grain, sugar, cotton, cattle, and flour.

State Finances.—The net amount of the debt of the State after deducting productive stocks and the sinking fund is \$2,616,704.23. The total assessed value of property in the State is \$666,857,893; of the city of Baltimore, \$491,921,328; basis of taxation of the State outside of Baltimore, \$174,936,475. The rate of the State tax on 100 is 17 cents. The receipts of the State for the year 1900 amounted to \$3,622,493; balance in treasury, \$707,926; total, \$4,330,419; disbursements, \$3,480,534; cash balance in treasury, \$849,885.

Government.—The governor is elected for a term of four years, and receives a salary of \$4,500 per annum. Legislative sessions are held biennially in even years, beginning on the first Wednesday in January, and are limited in length to 90 days. The Legislature has 26 members in the Senate, and 91 in the House, each of whom receives \$5.00 per day. There are 6 Representatives in Congress. The State government in 1901 was Democratic.

The Judiciary.—The judiciary of the State is elective; the term of office is 15 years. The court of appeals, the highest tribunal, consists of eight judges, seven of whom are the chief judges, respectively, of the seven judicial districts into which the State is divided, and one from Baltimore. The governor designates the chief judge. The judicial system of Baltimore is regulated differently from that of the counties. The judiciary is composed of eight judges, constituting the supreme bench of the city.

MARYLAND

Religion.—The strongest denominations in the State are Roman Catholic; Methodist Episcopal; Protestant Episcopal; Lutheran, General Synod; African Methodist; Methodist Protestant; Reformed; Methodist Episcopal, South; Presbyterian, North; and Regular Baptist, South. In 1900 there were reported 2,531 Evangelical Sunday Schools, with 32,903 officers and teachers, and 206,156 scholars.

Charities and Correction.—There is a Board of State Aid and Charities appointed by the governor. The State Insane Asylums are at Sykesville and Spring Grove. The State Penitentiary is located at Baltimore; also the House of Refuge for Boys, Saint Mary's Industrial School for Boys, Female House of Refuge, the School for the Blind, and School for the Colored Blind and Deaf, the State House of Correction for minor offenses against the law, located in Anne Arundel County, a State institution for education of the deaf and dumb in Frederick city. The Shepherd Asylum for the Insane, near Baltimore, established by Moses Shepherd.

Education.—In 1694, Governor Nicholson, the second royal Governor appointed by William and Mary, who had assumed the government of the Colony, established at Annapolis King William's College, which after the Revolution was changed into St. John's College, under which name it still exists. In 1750 Rev. Thomas Bacon established a manual training school in Talbot County, believed to be the first of the kind in the United States. In 1770 Eden Hall School was founded in Worcester County, and in 1784 Cokesbury College, under the patronage of the Methodist denomination, was established in Cecil County. In 1774, Charlotte Hall School was established under State authority, and still is a beneficiary of the State. In 1784, Washington College was founded at Chestertown, Kent County. The Western Maryland College for the education of the youth of both sexes was established in 1868 in Westminster, Carroll County. It receives an annual donation from the State of \$1,800. Under a series of acts of the General Assembly of the State, passed from time to time in compliance with the requirements of Art. VIII. of the Constitution of 1867, there has been gradually evolved the present excellent and uniform system of free public schools, with a State superintendent at its head, throughout the State, maintained by an adequate revenue raised by general taxation. In 1903 the expenditure for this purpose was \$734,683.05.

The fund thus raised is distributed by the comptroller among the counties and city of Baltimore, according to population. By an act passed in 1896, books for the pupils of the public schools are furnished free, and an annual tax is levied to meet this expenditure, which is \$150,000. Colored schools are maintained throughout the State at the public expense, and they share in the distribution of the school fund equally with the whites. In 1903, there were 2,357 schools in the State and 176 in Baltimore.

The Maryland Agricultural College, under the patronage of the State, is located in Prince George's County. While especially established for the education of youth in scientific agriculture, it gives tuition in other branches of knowledge, and in some of the mechanic arts. Attached to it is an experimental farm conducted

on a large scale. It has an annual donation of \$9,000 from the State. There is also an agricultural school for colored youth, supported in part by the State.

The public school system of the city of Baltimore is separate and distinct from that of the State. It was begun in 1829 with two schools, three teachers, and 269 pupils maintained by a system of local municipal taxation. In 1902, there were 129 schools in Baltimore, of which 18 were for colored pupils; 1,636 teachers and 66,399 pupils; of these, 10,018 were colored pupils. The amount of expenditure for the support of these schools in 1903 was \$1,401,267. In connection with this system of public schools in Baltimore is a high school or college for advanced pupils, which is authorized to confer academic degrees upon its graduates, and two female high schools, a polytechnic or manual training school, and a kindergarten and a female high school for colored children. The Woman's College of Baltimore City for the instruction of women in the higher branches of learning, established by Rev. John Goucher of the Methodist Church, commands a clientele from nearly every State in the Union. There are in Baltimore four medical schools with hospitals attached; one homœopathic institute, three law schools, and one dental college. Besides these public institutions there are in Baltimore and in several of the counties of the State private academies of high character and excellence for the education of youth of both sexes, conducted by masters of experience and learning. In 1886 the late Enoch Pratt established in Baltimore the Enoch Pratt Free Library with an endowment of \$1,058,000. The Mercantile Library is supported by private subscription. The Maryland Historical Society, founded in 1844, has a large library attached to it, especially valuable to students of history.

The existing system of public schools was inaugurated under the provisions of the new city charter, adopted in 1898, and is under the control of a board of school commissioners appointed by the mayor and city council. The board selects the superintendent.

Higher Education.—From 1690, the date of an event known in Maryland history as the Protestant revolution, by which the government of the colony was taken out of the hands of the Proprietary and transferred to the king of England, to the American Revolution of 1776, the instruction of Catholic youth by Catholic teachers was prohibited in Maryland by severe penalties. Catholic parents of wealth sent their sons and daughters to France or to the Netherlands for their education; those who could not afford to do this had to content themselves with tutors in their families. The Jesuit missionaries had secretly maintained, notwithstanding the prohibition against them, two schools for boys, one at Whitmarsh, Charles County, and one at Bohemia Manor in Cecil County. The American Revolution emancipated the Catholics of Maryland from the disabilities imposed by these intolerant laws. They were now free to educate their offspring without fear of fine or of forfeiture of property. The Reverend John Carroll, the first archbishop of Baltimore, at once devoted himself to provide for the educational wants not only of the Catholics, but of all others who should choose to avail themselves of the institutions he

MARYLAND

STATE CAPITOL AT ANNAPOLIS

MARYLAND

established. In this work he had the good fortune to secure valuable aid from an unexpected quarter. The French Revolution had driven into exile a large number of ecclesiastics of the Roman Catholic faith. Many of these had taken refuge in southern Maryland, where they found homes in the Catholic families resident in that part of the State. These gentlemen the Archbishop of Baltimore called to his assistance in this work. Rev. John Dubourg, afterward Archbishop of New Orleans, and of Besançon, France, became president of Georgetown University, founded in 1789, Rev. Francis Nagot, who, on his voyage to this country, had as a companion the celebrated Chateaubriand, became president of St. Mary's College, founded in Baltimore in 1791, and the Rev. John Dubois, afterward first Archbishop of New York, became president of Mt. St. Mary's College, founded near Emmitsburg, Maryland, 1808. Associated with these distinguished ecclesiastics and scholars as professors in these institutions were several of their compatriots and fellow exiles. These gentlemen gave to these seats of learning a distinguished reputation which attracted a great number of students from other States and from other countries. They imparted not only a knowledge of the arts and sciences, but a culture and refinement which left an indelible impression on those who had the good fortune of receiving their instructions. These institutions still remain and carry on the work so auspiciously begun. St. John's Literary Institution was established in Frederick in 1830 by Rev. John McElroy, S. J., and was largely patronized. In 1852, Loyola College was founded in Baltimore by the Jesuits, an order which has a world-wide fame as educators of youth "in virtue and learning," to quote the language of an Act of the Colonial Assembly of 1671.

The celebrated Mrs. Eliza Seton, foundress of the Sisters of Charity in the United States, established a school near Emmitsburg for the education of women, in 1809. The Order of the Visitation established female schools in Georgetown, Baltimore, and Frederick; the Carmelites in Baltimore, and the Sisters of Notre Dame in Baltimore City and Baltimore County. The Christian Brothers began their great work in primary education in Baltimore, 1845. In 1875, Johns Hopkins University, named after its munificent founder, John Hopkins, was established in Baltimore. Though the youngest of our great universities, it has attained a distinguished rank among the great seats of learning of our country, and enjoys a high reputation abroad. The Johns Hopkins Hospital, connected with the Johns Hopkins University, is the medical department of that institution. It was endowed by the same generous benefactor. It is located in the eastern section of Baltimore, and the buildings cover several acres of ground. The members of its faculty occupy a high rank in the medical profession for their scientific attainments and experimental knowledge. In 1867 George Peabody founded in Baltimore the Peabody Institute, Library, and Conservatory of Music. The library furnishes unequaled facilities to students and scholars in the prosecution of original investigation. The Maryland Institute for the promotion of the mechanic arts was established in Baltimore in 1847.

Provincial History.—Maryland was settled by a body of Englishmen under the auspices of Cecilus Calvert, the second Lord Baltimore and the first Lord Proprietary of the Province, under a charter granted to him by Charles I. on 20 June 1632. The charter was originally intended to be granted to Sir George Calvert, the first Lord Baltimore, and father of Cecilus; but that nobleman dying on 15 April 1632, after the charter had been drawn up, but before it passed the great seal, it was issued to Cecilus, his eldest son, the heir to his title and estates, and also to his schemes of colonization in America. In deference to the request of the king the name of Terra Mariæ, the land of Mary, was given to the province, after the name of his queen, Henrietta Maria, the daughter of Henry IV. of France. Sir George Calvert (q.v.), as the author of the charter, and the projector of the Province of Maryland, may be regarded as its real founder. When he arrived in Virginia he had reason to anticipate a civil, if not a cordial, reception from the authorities and people of the colony on the brief visit he proposed making. He was promptly met by a Dr. Pott, who, in the absence of the Governor, Sir John Harvey, was acting in that capacity, and the council, with a tender of the oath of supremacy, which as a Catholic he could not take, and which it was known he could not take, and which they had no authority to require of him. He declined to take the oath, and leaving Lady Baltimore and his family in Virginia, he sailed for England. On his arrival he applied for a charter and a grant of land north of the Potomac. The application was successful notwithstanding the opposition of the agents of Virginia in London, among whom was William Claiborne, of whom we are to hear more directly. But before the charter passed the great seal, Sir George Calvert, the first Lord Baltimore, died, leaving his eldest son, Cecilus Calvert (q.v.) his heir and who was to become first Lord Proprietary of the Province of Maryland. Cecilus zealously proceeded to execute his father's wishes and to carry out his plans for colonization under the charter. In this he was greatly delayed and hampered by the agents of the Virginia colony in London. They insisted on their objections to the charter, but on appeal to the Lords Commissioners of Plantations, that body in July 1633 overruled the objections and decided in Lord Baltimore's favor, and recommended to both parties the cultivation of friendly relations and good correspondence between them. This recommendation Cecilus Calvert always evinced, both by his instructions to the governor and authorities of his Province, and in his own conduct, a desire to pursue; but his efforts in that direction met with no response on the part of the Virginia colonists.

The main and principal objection urged by the Virginians to the Baltimore Charter was that it was an invasion of their chartered rights. At the time of the grant of the Maryland charter, Virginia had no chartered rights. The charter of the London or Virginia Company had been vacated and annulled by a judgment of the King's Bench on a quo warranto proceeding, instituted for that purpose, in 1624, eight years before the Baltimore grant was issued. Their objection on this ground was therefore wholly untenable. For, whatever may be said of the

MARYLAND

merits or demerits of that judgment, its legal effect to invest in the crown all right and title to the land granted in that charter to the company, and all civil and political authority and jurisdiction conferred on the corporation, could not be questioned. Virginia thenceforth became a royal colony, and the right of the crown to carve out of the territory, thus resumed, any grants of land it chose to make, and to invest the grantees with any civil or political authority it chose to bestow, could not be questioned. The judgment being that of the highest court in England was final and conclusive.

Nor were the inhabitants of Virginia at the time ill pleased with being relieved by that judgment of a government by a corporation, and erected into a royal colony. In 1643, when the question of a restoration of the charter of 1609 was agitated, the House of Burgesses of Virginia unanimously adopted and sent to the Committee on Plantations of the Privy Council an earnest remonstrance against the proposal, and nothing more was heard of it.

The boundaries of Maryland as laid down in the charter are as follows: Beginning at a point on the Eastern Shore of the Chesapeake Bay, known as Watkins Point, and running thence easterly to the ocean; then by the ocean and Delaware Bay unto the fortieth parallel of latitude; thence by that parallel west to the true meridian of the first fountain of the Potomac; thence verging toward the south unto the farther bank of the said river, and following the same on the west and south to the mouth of said river; and thence across the bay to the place of beginning. On comparing the boundaries set forth in the charter with the present limits of the State, it will be seen that Maryland has suffered a very considerable curtailment of the territory granted by the charter. The charter limits embraced the present State of Delaware, a strip of southern Pennsylvania 15 miles in width and 150 miles in length, embracing the site of Philadelphia; and the valley between the north and south branches of the Potomac River; constituting an area equal in extent to one third of the existing territorial area of the State. Against these flagrant encroachments on their territory both on the north and the south, Cecilius Calvert and his son and successor, Charles, offered strong but ineffectual protest and resistances, owing to the disturbed condition of the colony during the greater part of their proprietaryship. The controversy with the Penns in regard to the northern boundary of the province—the 40th parallel of latitude, according to the Baltimore charter—was of long standing, and led to much acrimony between the parties to it, and to actual, but bloodless, conflicts between the inhabitants on the border of the two provinces, Maryland and Pennsylvania. In these conflicts Col. Thomas Cresap, the noted Indian fighter and Revolutionary officer, figured conspicuously on the part of Maryland. The controversy was finally settled in 1762 by a decree of Lord Chancellor Hardwicke in the case of *Penn v. Baltimore*, under which the present boundary line between these States was run and marked by two English surveyors, Charles Mason and Jeremiah Dixon. This line, known as Mason and Dixon's line, subsequently became famous in our political annals as the dividing line between the free and the slave States.

In 1852, the General Assembly of Maryland

passed an Act conceding to Virginia all her right and title to the territory between the north and south branches of the Potomac. In 1877, a joint commission, appointed by Maryland and Virginia, determined the boundary line on the south between these States to be the Virginia or farther shore of the Potomac River at low-water mark; thus conceding the whole river to Maryland as her charter prescribed. The controversy concerning the strip of territory on the western frontier is still open and pending in the Supreme Court of the United States, between Maryland and West Virginia. Of the territory thus granted, the Lords Baltimore were created true and absolute Lords Proprietaries; they were invested with all the regal rights, jurisdictions, prerogatives, privileges, and franchises ever held or exercised by a bishop of Durham in the county of Durham. The Lord Proprietary could establish courts, appoint judges and all the executive officers of the Province from the governor to the constable of the hundred; establish ports; erect manors, and confer on the grantees the manorial rights recognized by English law, including the authority to hold courts baron and courts leet; could coin money; could appoint the members of the Governor's Council, which in time became the upper House of the General Assembly; could initiate all rules and ordinances for the government of the colony. Writs and indictments were in his name; he could pardon all crimes save treason. It was in the opinion of historians the most extensive grant of powers and jurisdiction that ever emanated from the English Crown, and made the Proprietary a quasi-sovereign within his domain. It was the grant of a palatinate. The charter was also a constitution of government securing to the colonists their rights as Englishmen.

Cecilius Calvert went zealously to work at once and organized an expedition consisting of about 300 persons, mostly Roman Catholics with their families and servants, and a considerable body of artisans and laborers. The expedition sailed from Cowes on board the *Ark and Dove*, on 22 Nov. 1633, being St. Cecilia's day. Two Jesuit missionaries, Fathers Andrew White and John Altham, accompanied the expedition. After a perilous voyage of four months, the colonists reached the mouth of the Potomac, and landed on an island they named Saint Clements, on 25 March 1634, the feast of the Annunciation of the Blessed Virgin Mary, and, according to the method of reckoning time then prevailing, the first day of the New Year. They erected a rude cross, and the Jesuit Fathers celebrated mass, and in the name of the King and of the Lord Proprietary, the colonists took possession of their new homes. Leonard Calvert, the brother of Cecilius, the commander of the expedition and the first governor of the Province, purchased from a tribe of Indians on the mainland a village and 30 square miles of contiguous territory. Here he established his capital and called it Saint Marie's. The colonists cultivated friendly relations with the aborigines, relations which were maintained almost uninterruptedly for the first 50 years of the colony's existence. The colonists erected a governor's house and a guard house, cultivated Indian maize, planted orchards and gardens, and soon Saint Marie's blossomed like a rose in the wilderness. But evil days were in store for them.

MARYLAND

William Claiborne, a member of the Virginia colony, and one of their agents in London, in opposing the grant of Maryland to Lord Baltimore, had while in England on that errand, obtained from Sir William Alexander, the secretary of state for Scotland, a license to trade to Nova Scotia, of which Alexander had acquired a grant. On his return to Virginia, he supplemented that license by another from the governor and council of Virginia to trade with Manhattan, the Dutch settlement, and New England. These were simple licenses to trade and contained no grant of land whatever. To facilitate his trade, he established a trading post on Kent Island in the Chesapeake Bay and within the limits of the grant about being made to Calvert. Lord Baltimore instructed Governor Calvert to require of Claiborne an acknowledgment of his authority, assuring him protection and security in whatever just rights he possessed. This Claiborne refused to do, and was supported in his refusal by the governor and council of Virginia to whom he referred the demand for advice. A controversy arose speedily ending in a conflict between the forces of Governor Calvert and an armed pinnace commanded by one of Claiborne's men. In this conflict lives were lost on both sides. Thus for the first time was American soil stained by English blood shed by English hands. Claiborne finally took refuge in Virginia, and Kent Island acknowledged the authority of the Lord Proprietary. The lords commissioners of plantations in 1638 ignored, on appeal, Claiborne's pretensions and sustained Lord Baltimore. One Richard Ingle, who seems to have had some connection with Claiborne, afterward invaded the Province with an armed force, took Saint Marie's, which he partially destroyed, compelled Governor Calvert to fly the province, and carried on for some time a general pillage of the inhabitants. Governor Calvert gathered a sufficient force of the colonists and compelled Ingle to desist from his piratical excursions and leave the Province.

The colony was now at peace, and owing to the genial climate, the fertile soil, favorable conditions of plantation, and the mild, tolerant and beneficent sway of the Proprietary and his government, it quickly attracted settlers and the population grew apace. This happy and prosperous condition of things continued for some years. In 1643 a colony of Puritans who had settled in Virginia, were expelled by the authorities of that colony for non-conformity in their religious worship with the Church of England. They took refuge in Maryland and solicited and obtained from the governor a large tract of land on the Severn where they made a settlement and named it Providence.

In 1650 they availed themselves of the Revolution in England, by which the government in church and state was overthrown by the Protector Cromwell, to start a revolution of their own in the Province alleging as the grounds therefor that their consciences would not permit them to swear allegiance to a Catholic proprietary, or to allow the celebration of the mass and of the rites of a Catholic Church where they could prevent them, and they accordingly set up a government of their own. Governor Stone, who had succeeded Leonard Calvert, himself a Protestant and a sympathizer with the Parliamentary party in England, marched with a force to put down

the revolt. He was defeated by the Puritans, himself and several others captured. The commander of the Puritans organized a drum-head court-martial, condemned Governor Stone and the prisoners to death, and did execute four of them. Governor Stone was saved by the refusal of the soldiers to execute the order of their commander for his assassination. The rebels then appealed to Cromwell for the ratification of their acts. The Protector sustained them in the usurpation of the government of the Proprietary, but refused to sanction their attempt to rob him of his property. On the restoration of Charles II. to the throne, the usurpation ended and the Lord Proprietary's government was re-established. Cecilius Calvert died in 1675, and was succeeded by his son Charles, the third Lord Baltimore and the second Proprietary of the Province. Cecilius has expended £40,000, a very large sum for that period, on the colony, and his rule had been marked by singular good sense, practical judgment, a liberal and enlightened policy on the subject of religious freedom, care and solicitude for the rights and interests of those one might call his subjects. Charles followed generally the example of his father in the government of the colony. Full representative government became firmly established, the governor and his council constituting the Upper House and delegates elected from the counties forming the Lower House of the Assembly. Between these Houses there was occasional friction on the subject of taxation, the dues claimed by the Lord Proprietary and the administration of the affairs of the land office by his lordship's agents.

In 1680, on the occasion of the expulsion of James II. and the accession of William and Mary to the throne of England, there occurred in the Province what is known as the Protestant revolution. The government of the colonies was taken out of the hands of Charles, Lord Baltimore; but his proprietary rights were not disturbed; although efforts to do so were made by some of the inhabitants. In 1715, on the death of Charles, Benedict Leonard, his son, succeeded both to the governmental authority of the colony as well as to his proprietary rights, Benedict having become a member of the Church of England. Benedict lived but a few months, and was succeeded by Charles II., and fifth Baron of Baltimore, who, dying 24 April 1751, was succeeded by Frederick, the sixth Lord Baltimore and the fifth Lord Proprietary. Frederick died in 1771, leaving no legitimate offspring. He devised the Province by will to his natural son, Henry Harford, who was the sixth and last Proprietary of Maryland. The American Revolution in 1776 terminated forever all royal authority as well as proprietary rule over Maryland.

State History.—Under the 16th section of the charter to Cecilius Calvert, Maryland enjoyed a special exemption from all taxation by the British government. But she promptly cast in her lot with her sister colonies in the struggle for independence. She sent 20,000 of her best sons to the Continental army under Washington, who distinguished themselves by their gallantry and good conduct. While Maryland by her delegates participated in the deliberations of the Continental Congress and answered its requisitions for men and money, she persistently declined signing the Articles of Confederation

MARYLAND

until the States of Virginia, Massachusetts, Connecticut, New York, North Carolina and Georgia, which claimed the territory west of the Alleghany Mountains, should surrender that territory and all claim and title to it, whether well or ill founded to the United States in Congress assembled, to be held by that body as the common patrimony of all the states, and to form in time, in the language of the resolution of her General Assembly, "free, convenient and independent states." This surrender was ultimately made, and Maryland signed the articles on 1 March 1781. Thus was a National public domain secured to the United States. It was for the government of this territory that the celebrated ordinance of 1787 was framed.

Maryland was the seventh State to join the American Union under the existing Constitution of the United States. She ceded in 1790 to the United States the territory on which Washington, the capital of the Nation, now stands. In the War of 1812 Maryland was the theatre of extensive military and naval operations on the part of Great Britain against the United States. A large force of British troops under the command of General Ross, supported by a fleet operating in the Bay and the Potomac River, and commanded by Admiral Cockburn, invaded Maryland, captured Washington, destroyed the public buildings, including the Capitol, and then marched to the capture of Baltimore. The Maryland troops under Gen. Smith and Gen. Stricker met the British troops at North Point, 12 miles from Baltimore City and defeated them with the loss of their commander, and the simultaneous attack by the British fleet on Fort McHenry that defended the entrance to the city by water, was repulsed. It was during this engagement between the fleet and the fort, that Francis Scott Key, who was on board the British fleet as a prisoner, wrote the National anthem, the "Star-Spangled Banner." Had Baltimore been captured, Philadelphia, the next point of attack, would probably have fallen. A column of British troops would have entered the North from Canada, and have effected or attempted to effect, a junction with the victorious British army, while the Western frontier, from the Lakes to the Gulf, would have been aflame with an insurrection of the hostile Indian tribes instigated by British emissaries. The defeat at North Point and Fort McHenry frustrated this dangerous scheme. Maryland sent several regiments to the Mexican War, and many of her sons fell on the field of honor while gallantly leading their regiments. During the Civil War sentiment in Maryland as in the other border States, was divided. But while a majority of her citizens sympathized with the South, the State did not secede. Many of her sons joined the Confederate army, while others enlisted in the Federal regiments. Since Maryland became a State she has had four constitutions; one adopted in 1776, one in 1851, one in 1864, and the last and present one adopted in 1867. In the year 1880, Baltimore (q.v.) celebrated its 150th anniversary with a week of festivities, and in 1884 the 250th anniversary of the landing of the colonists was celebrated. In 1891, a monument was erected to Leonard Calvert, the first governor, on the site of the old city of Saint Mary's, the first capital of the State, of which scarcely a trace remains.

Religious Toleration in Maryland.—The subject of religious toleration in Maryland has given rise to much discussion and controversy as to its origin, and to whom belongs the honor of originating it. The fact that religious freedom prevailed in the colony from its foundation in 1634 to the Protestant revolution in 1690 with a brief interruption during the Puritan usurpation in 1650-60, is not denied. During this period there was no established church, no taxation for the support of one, no compulsory attendance on its services. There was perfect equality before the law for all Christian denominations. After that revolution, in 1692, the Church of England was established by an act of the Provincial Legislature, although the members of that Church were greatly outnumbered by Roman Catholics, Dissenters and Quakers. By this act conformity with its worship, and the use of the Book of Common Prayer in every chapel or place of worship in the Province, were prescribed; and an annual tax of 40 pounds of tobacco was levied on all the inhabitants for the support of the Church. In 1702, Presbyterians, Quakers, and other non-conformists were relieved of some of the disabilities and burdens imposed by the act, but those imposed on Catholics remained. The penal statutes of England against the profession and practice of the Roman Catholic faith were made operative in Maryland by several acts of the General Assembly of the province, especially by the act of 1718, which incorporated bodily into the legislation of the colony the proscriptive statutes of 11 and 12 William III. Under this intolerant legislation several Roman Catholic families left the Province and took refuge in Pennsylvania, under the milder rule of the Penns; and in 1750 Charles Carroll, grandfather of the Carroll of Carrollton, went to France to obtain from Louis XV. a grant of land in the Louisiana territory to which to remove the Roman Catholics of Maryland as a body. In this he did not succeed and the Catholics remained in the province. This religious intolerance continued to the period of the American Revolution.

Some writers have attributed this early toleration to the charter of Charles I. to Cecilius Calvert, and have therefore attributed the honor of originating it to that monarch, the friend of Laud and Strafford, and during the early part of whose reign Roman Catholics and non-conformists were equally proscribed. The statement of this claim on behalf of Charles I. bears its own refutation. Besides, the charter remained the fundamental law of the Province during both the tolerant and intolerant periods of its history, and it gave no shield or protection to the Roman Catholics persecuted for their faith during the latter period, or during the brief regime of the Puritans in 1650-60. It is plain, therefore, that the honor does not belong to Charles I. and that toleration is not to be found in the provisions of the Charter.

The originators of this liberal and enlightened policy of religious toleration were Sir George Calvert and his son Cecilius, and to them and to them only, belongs the honor of its origin. When Sir George visited his Province of Avalon in Newfoundland in 1627-8, just after his conversion to the Roman Catholic Church, he erected a Roman Catholic Chapel and a Protestant place of worship at the same time, and secured for the latter the ministrations of one

MARYLAND

Rev. Erasmus Stourton. This divine, on his return to England, lodged an information against Lord Baltimore for permitting the celebration of the mass in his colony. If prosecuted, this charge would have subjected Calvert, under the law of England, to a heavy fine, one half of which would have gone to the Reverend informer, and to imprisonment. But owing perhaps to the favor of the king, or to the influence of powerful friends at court, the prosecution came to naught.

Cecilus Calvert was 19 years of age, when, with his father and family, he became a Roman Catholic. The change of faith of father and son in the face of the intolerant laws and the still more intolerant sentiments of the times, furnish indisputable testimony to the sincerity of their convictions. They sacrificed station, honors, offices. Both had been conscientious Protestants; they were now become equally conscientious Roman Catholics. No two men in England were so capable as this father and son, to feel and realize by their experience—and their observation, as well—for it was the era of the Thirty Years' war with all its horrors—the wrong, the injustice, the folly and the crime of religious persecution; and they resolved that in any colony where they should hold sway, they would have none of it. This noble resolve Cecilus afterward faithfully and religiously adhered to throughout his long and eventful career, as Lord Proprietary, notwithstanding strong provocations and the free hand he had to abandon this enlightened and liberal policy he inaugurated in Maryland, if he had chosen to do so; certainly as to the large body of dissenters and non-conformists with the Church of England.

In his first instructions for the government of the Colony, given to his brother Leonard on the sailing of the expedition, he enjoined this policy on him, and repeated this injunction in subsequent instructions. These instructions Leonard, sharing no doubt the sentiments of his father and brother, faithfully carried out in his able administration of the affairs of the Province.

In 1649, Lord Baltimore, exercising his right under the charter to initiate legislation, sent to Governor Calvert a body of sixteen laws to be submitted to, and enacted by, the Assembly. Among them was the celebrated Toleration Act of 1649. If not actually drawn up by Lord Baltimore himself, this Act was drawn up at his dictation. The Roman Catholic phraseology of some of the names used, and the identity of the language with that of the instructions previously sent out by him on this subject, leave no doubt on this point. "Whereas," is the noble preamble to this Magna Charta of religious liberty, "the enforcing of the human conscience in matters of religion hath frequently fallen out to be of dangerous consequence in those commonwealths, in which it hath been practised, and for the more quiet and peaceable government of this Province, and the better to preserve mutual love and amity amongst the inhabitants thereof, he it enacted that no person or persons whatsoever, within this Province professing to believe in Christ Jesus, should, from henceforth, be in any ways troubled, molested or discomfited for or on respect of his or her religion, nor in the free exercise thereof, nor in any way compelled to the belief or exercise of any other religion against

his or her consent." For any violation of this act, a fine was to be imposed and the offender was made liable to a civil suit for damages at the instance of the party injured. The act did not long remain on the statute book. When the Puritans overthrew the Proprietary's government in 1650, they convened a new Assembly. To this Assembly Roman Catholics were declared to be ineligible, and were not allowed to vote for members of it. The first thing this Assembly did was to repeal the act of 1649, and to pass one in lieu of it, which contained this provision, "That, none who profess and exercise the Papistic religion, commonly known by the name of the Roman Catholic religion, can be protected in this Province, by the laws of England, formerly established and yet unrepealed, nor by the government of the commonwealth of England. But are to be restrained from the exercise thereof;" of which all persons concerned were required to take notice. By a subsequent clause of this act it was provided "that all persons who professed faith in Christ Jesus . . . shall not be restrained . . . provided that this liberty shall not be extended to popery or prelacy." This excluded Roman Catholics and Episcopalians. The contrast between the acts of 1649 and 1654 is striking. On the restoration of the Proprietary to his government in 1660, the first thing done was to repeal this law and put the act of 1649 again on the statute book; and there it remained until, as a result of the Protestant revolution in 1690, it was again repealed and followed by a body of severe and stringent laws against Roman Catholics, which made the Proprietary himself as long as he remained a Catholic, and the Catholic Colonists the only outlaws for conscience sake in a Province, opened by their liberality to the professors of every Christian Creed. This condition of things continued until 1776. In the Declaration of Rights which prefaced the first Constitution of the State of Maryland adopted in that year, the principle of religious liberty announced for the first time in 1649 was enlarged and proclaimed as the inalienable right of the citizen, and a part of the fundamental law.

Population.—Maryland had a population in 1790 of 319,728; (1850), 583,034; (1870), 780,844; (1890), 1,042,390; (1900), 1,188,044. In 1900 the negro population was 235,064; foreign born, 93,834. The principal cities are Baltimore (pop. 508,957); Cumberland (17,128); Hagerstown (13,591); Frederick (9,296); and Annapolis (q.v.) 3,525.

The Press.—There are six daily papers published in Baltimore: 'The Sun,' established in 1837; 'The American,' established in 1794; 'The Herald'; 'The German Correspondent'; 'The Daily Record,' morning papers; 'The News'; 'The World,' afternoon papers; three weekly papers, 'The Catholic Mirror'; 'The Methodist Protestant,' and 'The Telegram.' Every county town has two newspapers.

LEO KNOTT, Baltimore, Md.

MARYLAND CAMPAIGN OF SEPTEMBER 1862

Maryland Campaign of September 1862. The Union army under Gen. Pope having been defeated and driven to the defenses of Washington, Gen. Lee, 3 Sept. 1862, marched from Chantilly for Leesburg. At the end of the first day's march Lee wrote to Jefferson Davis that the time seemed propitious "for the Confederate army to enter Maryland" and give her material aid in the recovery of her liberties. The next day he reached Leesburg, and again wrote that he was fully persuaded of the benefit that would result from an expedition into Maryland, and should proceed at once to make the movement, unless it was disapproved; also that he proposed to enter Pennsylvania, unless it should be deemed unadvisable upon political or other grounds. Without waiting for a reply to his two communications he crossed the Potomac at White's Ford, near Leesburg, on the 4th, 5th, and 6th, with an army of over 60,000 men, and marched to Frederick, Md., where, on the 8th, he suggested to President Davis that the position of affairs "placed it in the power of the government of the Confederate States to propose with propriety to that of the United States the recognition of our independence." On the same day he issued an address to the people of Maryland, stating his mission among them and that he was prepared to assist them in regaining the rights of which they had been despoiled. When Lee entered Maryland east of the Blue Ridge he took it for granted that the Union garrison at Harper's Ferry would be withdrawn, thus opening his line of communication through the Shenandoah Valley. This was not done, and it became necessary to dislodge the garrison from that post before concentrating the Confederate army west of the Blue Ridge, and Lee came to the decision to divide his army and capture the Union forces at Martinsburg and Harper's Ferry. On the morning of the 10th his army was put in motion from Frederick. Walker's division of two brigades crossed the Potomac at Point of Rocks, south of Harper's Ferry, and on the morning of the 13th established itself on Loudoun Heights: Jackson, with 14 brigades, marched over South Mountain at Turner's Gap, crossed the Potomac at Williamsport on the 11th, drove Gen. White from Martinsburg into Harper's Ferry (q.v.), and at noon of the 13th appeared before Bolivar Heights and invested Harper's Ferry from the Virginia side of the Potomac. McLaws, with ten brigades, marched over Brownsville Gap of the South Mountain, crossed Pleasant Valley, and on the evening of the 13th was in full possession of Maryland Heights (q.v.), thus completing the investment of Harper's Ferry and its garrison of over 12,000 men. Gen. Lee, with nine brigades of Longstreet's command and D. H. Hill's division of five brigades, followed Jackson over South Mountain, leaving Hill near Boonsboro to support Stuart's cavalry, which had been left east of the Blue Ridge. Lee, with Longstreet, moved to Hagerstown, there to await the capture of Harper's Ferry, and then to concentrate his army for a movement into Pennsylvania, the capture of Harrisburg, and the destruction of the long railroad bridge over the Susquehanna. Meanwhile Gen. McClellan, who had been placed in command of the Union troops for the defense of Washington, took the field at the head of over 87,000 men, and marched against Lee. His army, spread out

like a great fan, its left on the Potomac and its right on the Baltimore & Ohio railroad, cautiously advanced on Frederick, which was occupied on the 12th, and here McClellan found a copy of Lee's orders, showing the disposition of his scattered command. Tardy pursuit began, on the morning of the 13th Franklin's Sixth corps and Couch's division were put in motion to carry Crampton's Gap, in South Mountain, and relieve the garrison in Harper's Ferry, while McClellan, with the rest of the army, marched for Turner's Gap, six miles north of Crampton's, to cross the South Mountain and attack Lee. Franklin defeated the Confederates at Crampton's Gap on the 14th and, passing into Pleasant Valley, interposed between McLaws and Lee. Burnside, with the First and Ninth corps, attacked D. H. Hill at Turner's Gap and Fox's Gap the same day, Lee retraced his steps from Hagerstown to reinforce Hill, but when night came Lee had suffered defeat. He now abandoned his intention of invading Pennsylvania, ordered McLaws to elude Franklin and recross the Potomac somewhere south of Shepherdstown Ford, and at 10 o'clock that night put his own command in motion to recross the Potomac at Shepherdstown Ford, at the same time sending an order to Jackson to march from his investment of Harper's Ferry up the south side of the Potomac to Shepherdstown and cover the crossing. He crossed the Antietam in the morning of the 15th, where he hoped that McLaws might join him, but Franklin confined McLaws in Pleasant Valley. At noon he heard that Jackson had captured Harper's Ferry, whereupon he concluded not to retreat across the Potomac, but to give battle to McClellan on the heights and banks of the Antietam, and ordered Jackson to join him as soon as possible. McClellan followed Lee on the morning of the 15th, defeated Fitzhugh Lee's cavalry brigade in the streets of Boonsboro, and in the evening reached the banks of the Antietam to see Lee's army drawn up on the heights beyond. Franklin was left in Pleasant Valley to watch McLaws and relieve Harper's Ferry. Jackson joined Lee on the morning of the 16th, bringing Walker's division with him; McLaws eluded Franklin, passed out of Pleasant Valley and through Harper's Ferry, and joined Lee very early in the morning of the 17th. The battle of Antietam (q.v.) or Sharpsburg, the bloodiest one-day battle of the war, was fought on the 17th: both armies remained inactive on the 18th, and that night Lee re-crossed the Potomac at Shepherdstown Ford. McClellan followed on the morning of the 19th to the banks of the Potomac. On the 20th a part of Fitz-John Porter's Fifth corps crossed the Potomac at Shepherdstown Ford (q.v.), and was attacked and driven back across the river with great loss. This ended the campaign. From the beginning of the campaign to its close, 5-20 September, the Union losses, including Harper's Ferry and Maryland Heights, were 2,671 killed, 11,766 wounded, and 13,542 captured or missing, an aggregate of 27,979. The Confederate losses were 1,979 killed, 9,607 wounded, and 2,336 captured or missing, an aggregate of 13,922. The results of the campaign were momentous and far-reaching; the Confederate cause lost prestige and the National cause brightened. Recognition of Confederate independence by Great Britain and France, about to be granted, was withheld, and

MARYLAND HEIGHTS — MARYSVILLE

22 September Abraham Lincoln issued his preliminary proclamation of emancipation. Consult: 'Official Records,' Vol. XIX.; 'McClellan's Own Story'; Michie, 'Life of Gen. McClellan'; Palfrey, 'The Antietam and Fredericksburg'; Allan, 'History of the Army of Northern Virginia'; Walker, 'History of the Second Army Corps'; Long, 'Life of Gen. Lee'; Fitzhugh Lee, 'Life of Gen. Lee'; Cooke, 'Life of Stonewall Jackson'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. II.

E. A. CARMAN.

Maryland Heights, a bold wooded elevation in Maryland, rising 1,000 feet above the Potomac opposite Harper's Ferry (q.v.), W. Va. In these heights Elk Ridge, lying west of South Mountain, from which it is separated by the narrow Pleasant Valley, terminates. The heights are almost inaccessible, capable of strong defense, and completely command Harper's Ferry, which lies below it in the angle formed by the junction of the Potomac and Shenandoah rivers. When Harper's Ferry was seized by the Virginia forces in April 1861, Col. T. J. ("Stonewall") Jackson promptly occupied Maryland Heights, and they continued in Confederate possession until June of that year, when Gen. J. E. Johnston withdrew from the line of the Potomac and fell back to Winchester. The heights were then occupied by Union troops, and 5 Sept. 1862, when Lee crossed into Maryland they were held by Col. T. H. Ford with about 2,000 men and some heavy siege and field artillery. When Lee, at Frederick, Md., found that Harper's Ferry and the heights were still held by the Union troops, he sent three columns to surround and capture the garrison of more than 12,000 men. Jackson moved from Frederick on the morning of 10 September, crossed South Mountain and the Potomac and, driving everything before him, bivouacked on the 13th near Bolivar Heights. Walker crossed the Potomac south of Harper's Ferry and seized Loudoun Heights. McLaws, with ten brigades, marched from Frederick late on the 10th, camped that night near Brownsville Gap, crossed the gap next day, and on the 12th crossed Pleasant Valley, ascended Maryland Heights, with Kershaw's and Barksdale's brigades, at Solomon's Gap, five miles north of Harper's Ferry, drove in some skirmishers and, marching southward on the crest of the mountain, was checked near nightfall by Ford's men behind a barricade of logs. In the morning of the 13th he renewed his attack, which was stoutly resisted by Ford's men, who meanwhile had been reinforced by troops from Harper's Ferry. The Union troops were finally driven from the heights into Harper's Ferry, abandoning four guns, and at 4:30 P.M. McLaws was in complete possession, and put guns in position commanding Harper's Ferry, whose garrison surrendered on the 15th. The Union loss on Maryland Heights was about 150 killed and wounded; the Confederate loss was 35 killed and 178 wounded. After Lee had been driven across the Potomac the heights were occupied 20 September by troops of the Twelfth corps. The position was strongly fortified, and when, 15 June 1863, Milroy was defeated and driven from Winchester, Gen. French moved his garrison from Harper's Ferry to the heights. Under Gen. Meade's order French abandoned the position and distributed his troops at Fred-

erick and on the line of the Baltimore & Ohio railroad. When Lee was defeated at Gettysburg the heights were reoccupied, 7 July, by the Union forces, and continued in their possession until the close of the War. On 2 July 1864 Gen. Early reached Winchester on his way to menace Washington; Gen. Sigel, who was commanding the Union forces in and around Martinsburg, abandoned his position on the night of the 3d, crossed the Potomac at Shepherdstown, and on the night of the 5th established himself on Maryland Heights, with six regiments of infantry, 2,500 dismounted cavalry, two batteries of heavy artillery, and 26 field-guns, while Gen. Stahl was at Weverton and in Pleasant Valley, with 1,200 to 1,500 cavalry and four guns. Early followed Sigel across the river at Shepherdstown Ford, drove Stahl back and confined Sigel within his works; a heavy cannonade was kept up all night of the 6th, and there was sharp fighting next day; but, making no impression, and unable to maneuver Sigel out of his position, Early drew off and crossed the South Mountain toward Frederick.

Maryland Historical Society. See AMERICAN HISTORICAL SOCIETIES.

Maryland Yellowthroat, one of the most familiar of North American warblers (*Geothlypis trichas*). It is about 5.5 inches in length, migratory, makes a neatly concealed nest on the ground, almost always in a swamp or near a stream, and lays pink-white eggs delicately dotted with red. The plumage is bright yellow above, duller toward the tail; wings and tail greenish; under parts nearly white; and a characteristic jet-black mask across the face and on the sides of the head. The summer cry is a sharp questioning "What of it? Where'd ye get it?" The genus contains several related and similar species.

Marlyebone, mā'ri-lē-bōn or mār'li-būn, a metropolitan borough of London, England. See LONDON.

Marysville, mā'riz-vil, Cal., city, county-seat of Yuba County; at the junction of the Yuba and the Feather rivers, and on the Northern C. and the Southern P. R.R.'s; 52 miles by rail north of Sacramento.

Charles Covilland, a Frenchman, founded Marysville in 1849, after the discovery of gold in California. A trading post named New Mecklenburg had been established some years before. Covilland called the place Yubaville, which name it retained until 1850, when Marysville was adopted, and the following year it was chartered as a city. Its location at the head of navigation and proximity to valuable mines contributed to its growth, so that in 1860 it was the third city in size in the State. Since 1867 it has declined in importance and population.

The chief manufactures are dried and canned fruits, olive oil, flour, cigars, woolen goods, and foundry products. It has considerable trade in the products of the surrounding farms, especially in grains, fruits, sheep, wool, and cattle. The mines of the vicinity contribute to its industrial wealth. The city is the seat of the College of Notre Dame (R. C.) for women, public and parish high schools, and it has a fine public library. The city hall and court-house are handsome, well-built edifices. Pop. (1855) 8,000; (1890) 3,991; (1900) 3,497.

MARYSVILLE — MASBATE

Marysville, Kan., city, county-seat of Marshall County; on the Big Blue River, and on the Union P. and the St. Joseph & G. I. R.R.'s; about 80 miles in direct line northwest of Topeka. The manufactures are flour, furniture, foundry and machine-shop products. The city has considerable trade in wheat, corn, fruit, and live-stock. Pop. (1900) 2,006.

Marysville, Ohio, village, county-seat of Union County; on Mill Creek, and on the Cleveland, C. & St. L. and the Toledo & O. C. R.R.'s; about 30 miles northwest of Columbus. It is situated in an agricultural region, in which the farm products are mostly wheat, corn, and vegetables. The chief manufactures are dairy products, wagons, carriages, cooperage products, and lumber. There are two libraries, one the public school library, the other a library maintained by the Library and Reading Room Association. Pop. (1890) 2,810; (1900) 3,048.

Maryville, mā'ri-vil, Mo., city, county-seat of Nodaway County; on the Omaha, K. C. & E. and the Kansas City, St. J. & C. B. R.R.'s; about 42 miles north of Saint Joseph. It is in an agricultural region, and in the vicinity is fire-clay. The manufactures are brick, tile, foundry products, lumber, flour, corn-meal, and some dairy products. The trade is chiefly in grain, live stock, brick and tile, flour, and hogs. It is the seat of the Maryville Seminary. The prominent buildings are the county buildings, churches, and schools. Pop. (1900) 4,577.

Maryville, Tenn., village, county-seat of Blount County; on the Knoxville & A. railroad; about 18 miles south of Knoxville. It was settled as early as 1795. It is in an agricultural and stock-raising region, and near valuable marble quarries. Coal is found in the vicinity. The chief manufactures are flour, lumber, woolen goods, and dairy products. It is the seat of the Maryville College (Presbyterian), founded in 1819; the Freedmen's Normal Institute (Friends); and a normal school. Maryville has a fine court-house and some good church buildings. Pop. (1890) 1,686; (1900) 2,000.

Maryville College, an institution in Maryville, Tenn.; founded in 1819 under the auspices of the Presbyterian Church. The school is co-educational, and in 1902 had 16 instructors, over 400 students and about 12,000 volumes in the library. It has a preparatory department and the college course leads to the degree of A.B.

Marzials, mār'zi-alz (Fr. mār-zē-āl), **Frank Thomas**, English author: b. Lille, France 13 Jan. 1840. He has been accountant-general of the English army from 1898, having entered the War Office during the Crimean War and served therein continuously ever since. He has published lives of Gambetta, Dickens, and Victor Hugo; 'Death's Disguises and Other Sonnets'; etc.

Marzials, Theophile, or Theophilus, English poet: b. Brussels, Belgium, 21 Dec. 1850. He was a pupil in music at London of M. L. Lawson and studied also at Paris and Milan. From 1870 he was employed in the British Museum, where he became superintendent of the department of music. He is best known as a vocal composer ('Twickenham Ferry'; 'Three Sailor Boys'; 'Wait till you Come to Forty Year'; 'Ask Nothing More'); and he also published 'A Gallery of Pigeons and Other Poems.'

Masaccio, mā-săt'chō, Tommaso, properly **Guidi, gwě'dē**, Italian painter: b. San Giovanni, Tuscany, 21 Dec. 1402; d. Rome 1428. He went while very young to Rome, where he painted in the Church of St. Clemente a series of frescoes, the finest of which represents St. Catherine and the doctors before Maxentius. In 1421 he was admitted into the guild of the Speziali at Florence. Among the works of Masaccio are the frescoes in the Brancacci chapel of the Carmine, the 'Expulsion from Paradise'; 'St. Peter's Sermon'; the 'Tribute'; 'St. Peter Baptizing'; and the 'Raising of the King's Son,' the last of which was partly painted by Filippino. Consult Schmarsow, 'Masaccio-Studien' (1895).

Masai, mā-si', an East African race, speaking the Hamitic language, and occupying the Lake Kenia district. The Masais are men of large stature and magnificent physique. They are a warlike people and live mostly in military kraals, eating nothing but beef and drinking nothing but milk. The labor is done by slaves, women and children.

Masaniello, mā-sā-nē-ēl'ō, the commonly received name of **TOMMASO ANIELLO**, Italian revolutionist: b. Amalfi 1623; d. Naples 16 July 1647. He was a fisherman at Sorrento, and in 1647 roused and led an insurrection against the Spanish viceroy, the Duke of Arcos. He was successful, and obtained the abolition of unjust taxes and the revocation of an order to establish the Inquisition at Naples. But the people soon rose against him, too, and he was assassinated. An opera, music by Auber, libretto by Scribe and Delavigne, based on his career, was presented in 1828 at Paris as 'La Morte di Portici,' and in 1829 in England in English as 'Masaniello.'

Masaya, mā-si'ā, Nicaragua, town, in the western part, about 12 miles north of Lake Nicaragua and near Masaya Volcano, which is 3,000 feet in height. The town is connected by railroad with the cities of Leon, Managua, and Granada. Masaya is situated in an agricultural region, of which tobacco is one of the principal productions. The inhabitants are mostly Indians. Pop. 18,200

Masbate, mās-bā'tā, Philippines, an island of the Philippines in the eastern part of the Visayan Sea, south of Luzon and northwest of Samar; greatest length 82 miles northwest to southeast; width 45 miles; area, 1,230 square miles. It is very mountainous, the central chain being semicircular in shape, extending from southwest to southeast; and there are several rivers of considerable size. Communication between towns and villages is mostly by water, as there are few roads or even trails. The staple products are sugarcane, cotton, chocolate and hemp; tobacco of a strong quality is also raised. One of the chief industries is that of stock-raising (cattle, horses and hogs); over 1,000 head of cattle are ordinarily shipped monthly to other parts of the Philippines, mostly to Manila. Other important industries are the manufacture of sugar sacks from the burí palm, the manufacture of palm mats of superior workmanship and coloring, weaving, and fishing; there is also an active trade with Manila. In March 1901 the island was united with Ticao (140 square miles), Burias (258 square miles).

MASBATE — MASHONALAND

and the small adjacent islands, to form the province of Masbate; area of the whole province 1,732 square miles. In December 1901, the provincial governor reported general satisfaction with the government and unusual industrial activity. Pop. of province 23,069; Masbate and Ticao (q.v.) 21,366.

Masbate, Philippines, a pueblo and the capital of Masbate province, situated in the northeastern part of the island of Masbate on a peninsula dividing Palánog Port from Mobô Bay. It is a port of entry, and has a considerable trade. It has a church, a school, and some well constructed buildings. Pop. 2,400.

Mascagni, Pietro, pē'ā-trō mäs-kän'yē, Italian composer: b. Leghorn, Tuscany, 7 Dec. 1863. He was educated at the Milan Conservatoire and in 1890 his opera 'Cavalleria Rusticana' brought him immediate recognition in the musical world. His songs and ballads are popular and his successful career as a composer has been further aided by his operas: 'L'Amico Fritz' (1891); 'Les Rantzau' (1893); 'Iris' (1898); etc. In 1902 he visited the United States on an operatic tour.

Mascagnite, mäs-kän'yit, or **Mascagnine**, a native sulphate of ammonium, occurring notably at Sasso in Tuscany, where it was discovered by Mascagni, from whom it was named.

Mascarene (mäs-ka-rēn') **Islands**, a collective name for the islands of Bourbon, Mauritius, and Rodriguez, named after Mascarenhas, a Portuguese navigator, who discovered Bourbon in 1545.

Mas'cots and Hoodoos, a mascot is a person or thing supposed to bring good luck, while a hoodoo is an influence of evil. Another name for the hoodoo is Jonah, a term originating with superstitious sailors. The word mascot was first introduced into literature by means of the comic opera 'La Mascotte' written by Audran, but in France it appears to have been in common use for a long time previously among gamblers and sporting characters. It was used to signify some object, animate or inanimate, which like the luck-penny, brought good fortune to its possessor. The word is traced back to the *patois* of Provence and Gascony, where a mascot is something which brings luck to a household. Etymologically the word is derived from *masque* (masked or concealed), which in provincial French is applied—as *né coiffé* is in more polished French—to a child born with a caul. Such a child was believed to be destined, not only to be lucky himself, but to be the source of luck to others. In most European countries there is a large trade in charms and talismans to bring good fortune.

The term hoodoo is a manifest corruption of African voodooism and is a modified superstition of the system of terrorism which has been cultivated for years by the voodoo priesthood with remarkable success. There is, however, no scientific foundation for belief in either hoodoos or mascots, any more than there is in a reliance upon dreams and visions. Natural laws are not to be set aside by touching a hunchback or carrying a rabbit's foot in one's pocket. It is a fact, however, that in every age of the world the goddess of chance has been worshipped under one name or another, and modern civilization has not destroyed this cult. The belief in the mascot

for luck, or the hoodoo for ill-luck, is an indication of weakness and lack of decision. In the 'Iliad,' when Hector is told that "the birds are against him," and all the omens unlucky, the Trojan hero makes answer: "Without a bird his sword the true man draws; and asks no omen but his country's cause." See also OMENS; SUPERSTITION.

Mascou'ten, a belligerent tribe of Algonquians, the French *Nation du Feu*, "Fire Nation," dwelling along the Illinois River. They were at constant warfare with their neighbors, and are first mentioned by the earliest French missionaries as inhabiting southern Michigan, whence according to the traditions of the Ojibwas and Ottawas, they had been driven by the latter from the region around modern Mackinaw. In 1712 united with the Foxes and Kickapoo, they were almost exterminated, first by the French, and afterward by the Pottawatomi and their allies. The remnants migrated westward, and are last mentioned in 1779 as living with the Piankishaws and Kickapoos on the Wabash River. The name is derived from Mashkodainsug "little prairie people," a title now borne by a tribe of Pottawatomi Indians resident in Kansas.

Mash'am, Abigail Hill, Lady, confidante and favorite of Queen Anne of England: b. London 1670; d. 6 Dec. 1734. A cousin of Sarah Jennings, duchess of Marlborough, and also related to Robert Harley, earl of Oxford, she passed from the service of Lady Rivers, thanks to the influence of the Duchess of Marlborough, into that of Queen Anne, in whose favor she soon displaced her cousin, making every effort to turn the queen from the Marlboroughs and Whiggery to Toryism and even Jacobitism. She was married to Samuel Masham in 1707; had him made a baron in 1712; brought her kinsman Oxford into power, but soon turned him out; and, in short, was the power behind the throne, succeeding her cousin Marlborough. She retired after Queen Anne's death. She was a plain, homely, red-nosed woman, much bepraised by Swift, and accused of vulgarity, meanness, and covetousness by the Whigs.

Mashkodainsug. See MASCOUTEN.

Mashonaland, mā-shō'na-länd, South Africa, a province forming the northeastern portion of South Rhodesia, between the Zambesi and Matabeleland. It consists largely of open plains and table-lands, is well watered by the Umvatie and other feeders of the Zambesi, and is very fertile. The Mashonas belong to the Kaffir race, and were formerly masters of the whole territory between the Limpopo and the Zambesi, but were cooped up within their present territory by the powerful Matabele, whom they were unable successfully to resist. They are a peaceful people, clever as smiths and as weavers of cotton fabrics. The country came under the management of the British South Africa Company in 1890. It is rich in gold, which has been mined here at some remote and unknown period, old workings being still visible, and Mashonaland is with some degree of probability identified with the biblical Land of Ophir. Salisbury is the chief town. The population of Mashonaland in 1901 was estimated at 332,750, of whom 4,021 were whites and the rest natives. See RHODESIA.

MASINISSA — MASON

Masinissa, mäs-i-nis'a, king of Numidia: b. 238 B.C.; d. 148 B.C. He was at first ruler only of the east portion of the country, but latterly of the whole, having, by the help of the Romans during the second Punic war, defeated Syphax, king of Western Numidia, taking him prisoner with his wife Sophonisba, whose hand had formerly been promised to Masinissa. Masinissa now made her his wife, but Scipio Africanus, fearful of her influence, claimed her as a prisoner of Rome. Unable to resist, Masinissa sent her a poisoned chalice, of which she voluntarily drank. Masinissa commanded the Roman cavalry on the right wing at the battle of Zama, which ended the second Punic war (201 B.C.).

Mask, a covering for the face, often shaped so as to form a rude representation of human or animal features. They have been in use from the most ancient times. Among the Greeks they were used, particularly in the processions and ceremonies attending the orgies of Dionysus. Some ancient masks seem to have been, like the modern ones, merely coverings for the face, but it was more usual for them to cover the whole head, and represent, with the features, the head, hair, and eyes. They were at first made of the bark of trees, then of leather, afterward of wood, which the artist fashioned according to the design of the poet. The comic masks were distinguished by a grotesque laughing countenance; the tragic ones had more dignity, but were sometimes frightful. There were also satyr masks and orchestric, or those with regular features, for dancers. They had mostly very large open mouths, within which were metallic bars or other sounding bodies to strengthen the voice of the speaker—a contrivance which was required by the construction and immense size of the old theatres. The mask used at modern masked balls or masquerades is a covering for the head and face made from a light stuff, with which a person may disguise himself and remain unknown, or perhaps represent some other character. There are whole and half masks—for example, masks for the nose and the eyes. See also CARNIVAL; MASQUERADES.

Mas'kegon (swamp people), a remnant of a tribe of Indians, part of the old Algonquin stock, who formerly lived by hunting and fishing. They are now in the "swamp region" of Canada, between Hudson Bay and Lake Winnipeg, and are classed with the Cree and Ojibwa people. To some extent they are now engaged in lumbering and a few do some farming. The estimated number of Maskegons (1903) is 2,000.

Maskelyne, mäs'ké-lin, **Nevil**, English astronomer and mathematician: b. London 6 Oct. 1732; d. Greenwich 9 Feb. 1811. He was educated at Westminster School and at Trinity College, Cambridge; devoted himself to astronomy; and in 1765 was appointed astronomer royal. He made careful studies of terrestrial density, introduced into navigation the method of taking longitudes by lunar distances, and made many improvements in astronomical apparatus.

Mason, mä'són, **Alfred Edward Woodley**, English novelist: b. 7 May 1865. He was educated at Oxford and among his works, the most of which have been reprinted in the United States, are: 'A Romance of Wastdale' (1895); 'The Courtship of Maurice Buckler' (1896, dramatized 1897); 'The Philanderers' (1897);

'Lawrence Clavering' (1897); 'Miranda of the Balcony' (1899, dramatized in New York 1901); 'The Watchers' (1899); 'Ensign Knightley'; 'Clementina' (1902); 'The Four Feathers' (1902).

Mason, Amelia Gere, American author: b. Northampton, Mass. She was graduated from Mt. Holyoke and studied music in New York and Boston and in 1872 was married to A. A. Mason of Providence, R. I. She has since spent much of her time in Europe engaged in literary researches, and has published: 'The Women of the French Saloons' (1891); and 'Woman in the Golden Ages' (1901).

Mason, Caroline Atwater, American author: b. Providence, R. I., 10 July 1853. She was educated in Friends' schools and in Germany, and was married to Rev. John H. Mason in 1877. She has published: 'A Titled Maiden'; 'A Minister of the World'; 'The Minister of Carthage'; 'The Quiet King'; 'A Wind Flower'; 'A Woman of Yesterday' (1901); 'The Little Green God,' which has been widely read (1902), etc.

Mason, Charles, English astronomer and surveyor: b. England about 1730; d. Philadelphia Feb. 1787. He was for years assistant astronomer at the Greenwich Observatory and was sent on various expeditions in the service of science. In 1763 he was employed with Jeremiah Dixon to survey the boundary line between Maryland and Pennsylvania and they were engaged in this undertaking until 1767, the line established becoming famous in American history as the "Mason and Dixon's Line" (q.v.). They returned to England and Mason was thereafter engaged in astronomical observations and researches until the time, the precise date of which is not known, when he returned to America. His work upon the lunar tables of Tobias Mayer which were published in London in 1787 under the title 'Mayer's Lunar Tables Improved by Charles Mason,' enjoyed a high reputation for reliability.

Mason, Francis, American missionary and Orientalist: b. York, England, 2 April 1799; d. Rangoon, Burma, 3 March 1874. He was the son of a shoemaker; studied by himself; came to the United States in 1818; worked as a shoemaker through Massachusetts; joined the Baptist Church in 1825; and in 1827 was licensed to preach; sailed for Burma in 1830; and settled in Tavoy, where he worked for 22 years. He was a brilliant linguist; reduced two Karen dialects to writing; and in 1853, upon his removal to Toungoo, published a Karen version of the Bible. He made special study of Pali literature, and of the physical and ethnical peculiarities of Burma, publishing in 1852 'Tenasserim, or the Fauna, Flora, Minerals, and Nations of British Burma and Pegu' (revised 1860), a work undertaken as a means to the thorough knowledge of the country necessary for accuracy in his scriptural version. His other works, besides translations, include: 'Life of the Karen Apostle,' a memoir of his wife (1847), and 'The Story of a Workingman's Life, with Sketches of Travel' (1870).

Mason, George, American patriot: b. in Stafford (now Fairfax) County, Va., 1725; d. 7 Oct. 1792. After his marriage he became a neighbor of Washington, with whom he formed

MASON

a friendship. He was a member of the first Ohio Company, and was elected to the Virginia assembly before 1760. As a leader of the opposition to the Stamp Act (q.v.) in Virginia, in 1760, he drafted the non-importation resolutions presented to the assembly by Washington and adopted unanimously. In 1774, at a public meeting, he offered 24 resolutions on the questions at issue between Great Britain and the colonies. These resolutions, which favored the policy of non-intercourse with England, were sanctioned by the Virginia Convention in August and reaffirmed by the Continental Congress in October of the same year. He was made a member of the Virginia committee of safety, and in 1776 sat in the Virginia constitutional convention, in which he drafted the Bill of Rights, which has remained famous as perhaps the most liberal declaration of the rights of man extant at that period. He was elected to the Continental Congress in 1777, but declined to serve, preferring to remain in the legislature, of which he continued for years to be a member. In the Constitutional Convention at Philadelphia, 1787, he took a leading part in the debates, his influence being always on the Liberal side. He strongly opposed the clause deferring abolition of the slave-trade, and in the end declined to sign the Constitution. In the Virginia convention he joined Patrick Henry in opposing its ratification, and of 20 alterations proposed by him several were afterward adopted by Congress and the States. Mason was elected as one of the first United States Senators from Virginia, but declined to serve. He died at Gunston Hall, which he built, near Mount Vernon, and where he lived throughout the greater part of his career. His statue, with those of other great Virginians, stands at the base of Washington's in front of the Capitol at Richmond.

Mason, James Murray, American legislator: b. Mason's Island, Va., 3 Nov. 1798; d. near Alexandria, Va., 28 April 1871. He was graduated from the University of Pennsylvania in 1818, studied law and upon being admitted to the bar established a practice at Winchester, Va. He was in public office much of the time and in 1847 was elected to the United States Senate, representing Virginia, where he proved a consistent and strong adherent to the policies favored by his State. He was the author of the fugitive slave law of 1850 and at the outbreak of the Civil War he resigned his seat in the Senate to enter the service of the Confederacy. He was sent to England with Slidell as Confederate commissioner, but was captured on the steamer *Trent* (see *TRENT AFFAIR*, THE) and taken to Boston where he was confined in Fort Warren until 1862 when he sailed for Europe and until the end of the war endeavored to secure recognition of the Confederacy. After the war Mason lived for a time in Canada, but returned to Virginia some years before his death.

Mason, Jeremiah, American lawyer and politician: b. Lebanon, Conn., 27 April 1768; d. Boston 14 Oct. 1848. He was graduated at Yale in 1788, admitted to the bar in 1791, and began to practise law at Westmoreland, N. H. In 1794 he removed to Walpole, N. H., and in 1797 settled at Portsmouth, where he lived for 35 years. At the New Hampshire bar, then the most famous in the country, Mason soon reached

pre-eminence, among his fellow members being Daniel Webster and Jeremiah Smith. In 1802 Mason was appointed attorney-general of New Hampshire, and in 1813 became a United States senator. He was a strong Federalist, and took a leading part in the senatorial debates on matters relating to the War of 1812, his speech on the Embargo, delivered in 1814, and that on the conscription bill, 1815, being notable among public utterances of the time. In 1817 he resigned his seat to resume his practice, but afterward served for several terms as a member of the New Hampshire legislature, and rendered great assistance in the codification of the State laws. He removed to Boston in 1832, and practised in the courts until he reached 70, when he retired, with reputation fully maintained, to the more private work of his profession.

Mason, John, American colonist, founder of New Hampshire: b. Lynn Regis, Norfolk, England, 1586; d. London, December 1635. In 1610 he served in the navy against insurgents in the Hebrides; in 1616 went as governor to Newfoundland, of which, in 1620, he published a description, and in 1626 a map. In 1617 he explored the coast of New England; obtained in 1622 a grant of a region called Mariana (north-eastern Massachusetts); in the same year, with Sir Ferdinando Gorges, procured a patent for the provinces of Maine; and in 1623 sent a colony to the Piscataqua River. In 1629 he obtained a patent for the New Hampshire colony, also taking one with Gorges for Laconia, a tract including Lake Champlain. Among various prominent positions which Mason held in England was that of judge in Hampshire 1635, and in the same year he was appointed vice-admiral of New England. In 1691 his rights in New Hampshire were sold to Gov. Samuel Allen. Mason was buried in Westminster Abbey. Consult Tuttle, 'Memoir of Captain John Mason, the Founder of New Hampshire,' in an edition of Mason's description of Newfoundland (1887).

Mason, John, American colonial commander: b. in England about 1600; d. Norwich Conn., 1672. Under Sir Thomas Fairfax he served in the Netherlands; in 1630 settled at Dorchester, Mass.: in 1633 was appointed to a military command at Boston; and two years later joined with others in founding Windsor, Conn. In 1637 he was given command of an expedition of English and Indians against the Pequots (q.v.), whom he almost annihilated, completing their destruction in a second movement a little later. He removed first to Saybrook, and afterward to Norwich. For 30 years he was a major of the Connecticut forces, was a magistrate for many years, and deputy governor 1660-70. From 1642 to 1668 he served as judge of the colonial court. His 'Brief History of the Pequot War,' written at the request of the General Court, was reprinted by Increase Mather in his 'Relation of Trouble by the Indians' (1677, republished by Prince 1736). Consult Ellis, 'Life of John Mason of Connecticut,' in Sparks' 'Library of American Biography.'

Mason, John Mitchell, American divine: b. New York 19 March 1770; d. there 26 Dec. 1829. His father was pastor of an Associate Reformed Church, and the son was graduated at Columbia College in 1789, and after studying theology under his father's care for one year went in 1791 to the University of Edinburgh.

MASON

He was recalled in 1792 by intelligence of his father's death, and became his successor in his pastoral charge in 1793. He planned a theological seminary to be under the authority of his denomination, and visited Great Britain for the purpose of obtaining contributions; his pulpit efforts abroad gaining him repute there as one of the first preachers of the time. The seminary being established in New York city in 1804, he was appointed its first professor of theology. In 1806 he projected the 'Christian's Magazine,' which he conducted for several years, and in which he carried on a controversy with Bishop Hobart. In 1811 he became provost of Columbia College, and by his talents and energy raised that institution to a higher character than it had ever before possessed. In 1821 he exchanged his pastorate for the presidency of Dickinson College, Carlisle, Pa., and the next year entered the Presbyterian ministry. He was one of the great pulpit orators of his day and his discourses on the deaths of Washington (1800) and Hamilton (1804) are masterpieces of their kind. See 'Life,' by Van Vechten (1856).

Mason, John Young, American politician: b. Greenville, Sussex County, Va., 18 April 1799; d. Paris 3 Oct. 1859. He was educated at the University of North Carolina; was admitted to the bar in 1819; became a judge in State and Federal courts; served several terms in the Virginia assembly; and from 1831 to 1837 was a member of Congress. Then till 1844 he was judge of the United States court for the district of Virginia, and in that year became secretary of the navy in the cabinet of President Tyler. Although he served temporarily as attorney-general under Polk, he re-entered the Navy Department. President Pierce, in 1853, appointed him minister to France, and until his death he continued to fill this diplomatic position. With James Buchanan and Pierre Soulé (qq.v.) he signed the Ostend Manifesto (q.v.).

Mason, Sir Josiah, English philanthropist: b. Kidderminster, England, 23 Feb. 1795; d. Erdington, England, 16 June 1881. As a child he sold fruit and cakes on the street, but worked his way up until in 1829 he engaged in making pens and became the largest manufacturer of pens in the world. His early struggles made him desirous of helping those in like circumstances and the generous amounts paid by him for patents were the means of establishing more than one inventor. He erected almshouses, built at Erdington an orphanage which shelters and educates 500 children, founded the Mason Science College at Birmingham and contributed to other benefactions.

Mason, Lowell, American musician: b. Medfield, Norfolk County, Mass., 8 Jan. 1792; d. Orange, N. J., 11 Aug. 1872. His general education was small; in music he was self-instructed and wonderfully adept even when a boy, being choir leader in Medfield when 16, and a teacher in Savannah, where he removed in 1812. In 1821 he published a collection of psalm tunes based on Gardiner's 'Sacred Melodies,' but including some of Mason's own compositions. The book was successful; he returned to Massachusetts in 1827, devoted himself to vocal instruction, soon adopting the improved Pestalozzian method, and in 1837 traveled in Europe. His last years were spent in Orange, New Jersey. More than any other one man Lowell

Mason effected a change in American ecclesiastical music, brought about congregational singing, cultivated a popular taste for good music, and made the musical education of children the rule and no longer the exception. He is best known for his hymn tunes, notably Cowper ('There is a Fountain'), and Missionary Hymn ('From Greenland's Icy Mountains'). Mason's more important publications were: 'Juvenile Psalmist' (1829); 'Lyra Sacra' (1837); 'The Psalter' (1845); 'Carmina Sacra' (1841; new series 1852); and 'Musical Letters from Abroad' (1853). Mason's musical library is now the property of Yale University.

Mason, Otis Tufton, American ethnologist: b. Eastport, Maine, 10 April 1838. He was graduated from Columbia University in 1861 and from 1861-84 was at the head of its preparatory school. Since 1884 he has been curator of ethnology at the National Museum. He is an influential member of various scientific societies and has published: 'Cradles of the American Aborigines' (1889); 'Woman's Share in Primitive Culture' (1894); 'The Origin of Inventions' (1895); etc.

Mason, Rufus Ogden, American physician: b. Sullivan, N. H., 22 Jan. 1830; d. New York 1903. He was graduated from Dartmouth College in 1854, and from the College of Physicians and Surgeons in New York in 1859. During the Civil War he was an acting assistant surgeon. He was almost as well known as an author as he was a physician, and among his books are: 'Sketches and Impressions, Musical, Theatrical and Social, Including a Sketch of the Philharmonic Society of New York' (1887); 'Telepathy and the Subliminal Self' (1897); 'Hypnotism and Suggestion in Therapeutics' (1901).

Mason, William, English poet: b. Hull 12 Feb. 1724; d. York 7 April 1797. He was educated at Cambridge, and his first publication was 'Isis,' a poem, satirizing the Jacobitism and high church principles which prevailed in the University of Oxford. In 1852 he published 'Elfrida,' a tragedy, with choral odes, on the ancient Greek model. Having taken orders in the church he obtained the living of Aston, in Yorkshire, and was appointed one of the royal chaplains. In 1759 appeared 'Caractacus,' a drama. Some years after Mason was made precentor and residentiary canon at York. One of his principal works, the 'English Garden,' a poem, appeared between 1772 and 1782; and was translated into French and German. In 1775 he published the poems of his friend Thomas Gray (q.v.) with memoirs of his life. His principal subsequent publications are: 'Odes'; 'Life of William Whitehead,' with his poems (1788); 'Essay on Church Music' (1795). At the beginning of the American war Mason became so active an advocate for freedom as to give offense at court, and was consequently dismissed from his chaplainship.

Mason, William, American musician: b. Boston 24 Jan. 1820. He is a son of Lowell Mason (q.v.), and studied music in Germany under Moscheles, Hauptmann, Moritz, Dreyschock, and Liszt; made tours as a pianist in Europe and the United States; and since 1855, when he settled in New York, has been chiefly engaged in teaching and composition. In that year, with Theodore Thomas and others, he established the Mason and Thomas recitals of chamber music,

MASON — MASON-BEES

which were continued until 1878. His compositions, many in number, are mainly for the piano. He has written: 'Two Pianoforte Methods' (with E. S. Hoadley); 'Pianoforte Technics' (with W. S. B. Matthews); 'Touch and Technics' (1878); 'Memories of a Musical Life' (1901); etc.

Mason, William Ernest, American legislator: b. Franklinville, N. Y., 7 July 1850. He removed with his parents to Bentonsport, Ia., in 1858, and after teaching school, 1866-70, was admitted to the bar and began practice in Chicago, Ill., in 1872. He was a member of the Illinois General Assembly in 1879, of the State Senate in 1881-5; and of Congress 1887-91. In 1897 he was elected United States Senator, in which capacity he warmly advocated the cause of Cuban independence.

Mason, Mich., city, county-seat of Ingham County; on the Michigan Central railroad; about 14 miles south by east of Lansing. It was settled in 1839, and in 1865 was incorporated as a village, and in 1875 chartered as a city. It is in a farming region and the industries are chiefly connected with farm products. The principal manufactures are foundry and machine-shop products, flour, fruit evaporators, dairy products, bricks, tiles, wagons, and carriages. The trade is chiefly in the manufactures, grain, fruit, and live-stock. The principal buildings are the court-house, the churches, and schools. The city owns and operates the electrical light plant and the waterworks. Pop. (1900) 1,828.

Mason City, Iowa, city, county-seat of Cerro Gordo County; on the Chicago, M. & St. P., the Chicago & N. W., the Iowa C., and the Chicago G. W. R.R.'s; about 115 miles in direct line north by east of Des Moines. It was settled in 1855 and its present charter was granted in 1870. It is in an agricultural and stock-raising region, fire-clay and valuable sandstone quarries are in the vicinity. Its chief industrial interests are connected with the manufacturing of sash and doors, brick and tile, flour, and lime, and the quarrying of sandstone. It has a large foundry and considerable trade in live-stock and grain. The city is a trade centre and distributing point for a large section of country, and has several wholesale establishments. The government is vested in a mayor, who holds office two years, and a council. The waterworks are owned and operated by the city. Pop. (1890) 4,007; (1900) 6,746.

Mason and Dixon's Line, in United States history, a line popularly known as dividing the slaveholding from the non-slaveholding States. The line was surveyed by two English engineers, Charles Mason and Jeremiah Dixon, between the years 1764 and 1767, for the purpose of settling the disputed boundaries between Maryland on the one side and Pennsylvania and Delaware on the other. Their instructions were to begin at the Atlantic Ocean, and run due west to a point midway between the Atlantic and the Chesapeake Bay; thence north, so that the line should become a tangent to the northwestern boundary of Delaware, which was a circle described from Newcastle court-house as centre, with a radius of 12 miles. The line was then to follow the curve in a westerly direction till it reached a point due north of the point of tangency; thence due north till it intersected a line run due west

from a point 15 miles south of Philadelphia; and thence due west until it intersected a line running due north from the source of the Potomac River. The work was done with such skill and accuracy that a revision in 1849, with instruments of much greater precision, disclosed no error of importance. The line was again surveyed between 1901 and 1903 under the direction of a joint commission representing Pennsylvania and Maryland. The line was originally marked by stones or other designations placed one mile apart. But in the course of time many of the markers disappeared, and disputes as to local boundaries arose. Pennsylvania and Maryland each appropriated \$5,000 for a new survey of the line, and work was begun in April 1901, W. G. Hodgkins, of the United States Coast and Geodetic Survey, being in charge of the corps of engineers. It is the portion of Mason and Dixon's line that extends as far as the western limits of Maryland, which has been re-surveyed. Some of the original boundary stones were found to be still in place. They had been chiseled in England from limestone, and weigh 500 pounds each, being four and one-half feet high and one foot square. On one side is the letter "P." and on the other the letter "M." Every fifth stone bore the coat-of-arms of the two proprietaries. Hodgkin's men endeavored to trace the stones that were missing, and succeeded in recovering a large number. Some were doing duty as doorsteps, some were in bake-ovens, one served as a curbstone in Clear-spring, Md., and two had been used in building a church along the national pike. The old markers in many instances bore curious inscriptions, some carved by soldiers of the Federal and Confederate armies during the campaigns of the Civil War. Every one of these stones that could be secured was placed in position on the boundary line. If broken, the pieces were clamped together. The stones were set in a bed of concrete, to guard against future removal. In a few localities a half-dozen or more of these stones were found in proximity. This leads to the belief that possibly they were not put to actual use as boundary markers. It is known that the full number of stones required by Mason and Dixon was imported, but in conveying them westward through the forests, so many difficulties were encountered, it is supposed, that a portion of the consignment was abandoned along the road; and in the course of years settlers found these stones useful for a variety of purposes other than that for which they were intended. This theory is substantiated by the fact that the western part of Mason and Dixon's line was found to be marked principally by mounds or wooden posts, few stones being discovered. Sufficient of the original stones were recovered to mark the entire line, with the exception of about 75 miles. Where none of the old markers was available, new marble monuments were erected.

Mason-bees, a name given to the small wild bees of the genera *Osmia*, *Ceratostomia*, and *Chalcidoma*, which construct their nests with sand or gravel, agglutinated together by means of a viscid saliva, and fix them on the side of walls, under stones, within the hollows of plant stems whence the pith has been removed, or avail themselves of some other cavity for that purpose. The mason-bees, like the carpenter-

MASONIC FRATERNITY

bees, leaf-cutters, and other allied forms of the family *Megachilidae*, are solitary in habits, not living in communities, although groups of cells are usually found near together, made by the same mother-bee, and each containing a single egg and food,—a mixture of honey and pollen. Consult Howard, 'The Insect Book' (1901), which contains an extensive bibliography of the subject.

Masonic Fraternity, The, an organization of associated societies to which, by common consent, has been accorded the primacy among fraternal orders. Divided into groups of degrees, overlying one another like the foundation and superstructure of a symmetrical building, these constitute the three great rites of universal recognition, namely, English, American, and Scottish Masonry. The first and second are acknowledged to compose the great masonic institution as it exists in Great Britain and dependencies, and in the United States; while the elaborate Scottish Rite of 33 degrees, comprising a more limited membership therein, is the one most widely disseminated in other portions of the world. Each rite is complex in its inter-dependent system of government, and is essentially cosmopolitan, bearing upon its rolls the names of emperors, kings, princes, presidents, and governors, together with scholars, statesmen, and men of affairs, as well as those of lesser stations in church and state. The full legal title is, "The Ancient and Honorable Fraternity of Free and Accepted Masons and Concordant Orders."

The Appeal to Antiquity.—During the 18th and first half of the 19th century masonic writers laid great stress upon the possible origin of the society in the remote ages of the past. Absolutely without any historical basis of fact or record as were most of these theories, yet men of learning loaned their influence to perpetuate the fables extant concerning the fraternity. Some asserted (a) that the history of the race was the story of masonry, beginning with the migration from the Garden of Eden; others (b) that it sprang from the Patriarchal period; and still others contended (c) that the society was the successor of the ancient mysteries of the Orient; (d) that the Temple of Solomon was its cradle; (e) that the Crusaders and the Knights Templars carried it forward from their times; (f) that the Roman colleges of artificers and builders of the Middle Ages handed down the craft to posterity; (g) that the civil strifes in Great Britain of the 15th and 16th centuries, and subsequent political events, made the institution possible; (h) and a later class of writers placed its origin to the credit of the Rev. James Anderson, D.D., and the Rev. John Theophilus Desaguliers, LL.D., F.R.S., and their compeers of "The Revival of 1717 A.D." Several of these authors changed their views later in life; and, during the past 50 years, the intelligent masons of Great Britain, and the United States, have attempted to build up from the broken fragments of the past,—contained in fugitive lodge records extending back nearly three centuries,—a reasonable history of the "operative" masonry of the British Isles and the continent of Europe, as well as that of the present "speculative craft." In this effort assistance has been rendered by scholars not connected with the fraternity. The critical reader will note, in the enumeration

above, that many plausible theories might be founded upon both history and legend, but the strongest factor in the appeal to antiquity, nevertheless, is the "Legend of the Third Degree." In one form or another the allegory of the fall of man, the sacrificial redemption of the race, the doctrines of the resurrection and immortal life, permeated the peoples of every age and became the motive of many migrations. This fact is likewise of record,—established by the discoveries made in Bible lands during the 19th century,—dating four millenaries B.C. When, therefore, a society arose which claimed to solve some of these mysteries,—nay, even to have descended from those periods,—it is not singular that the cult should have attracted disciples; especially when shielded from public gaze by a veil of secrecy, the universality of the printed page not having yet been established!

In Great Britain and on the Continent.—The consensus of reliable historical opinion affirms that the premier Grand Lodge of England, organized 24 June 1717 A.D., is the mother of all regular masonic lodges of the three craft degrees, and, therefore, peculiar interest centres in the landmarks, legends, and authentic narratives pertaining to the English rite itself, as well as in the American rite, the daughter thereof, so to speak. The apocryphal history of masonry recites that it was introduced into England by Prince Edwin, 926 A.D., and that lodges were "warranted at York," by King Athelstan. This "Legend of the Guild" and much other traditional story, is based upon curious manuscripts called "Old Constitutions," or "Old Charges of British Freemasons." The oldest of these is dated, by English antiquaries, 1390 A.D., and is registered as the "Regius MS., or Halliwell Poem." The next in age,—beginning of the 15th century,—is called the "Matthew Cooke MS."—both in custody of the British Museum. Within the past half-century, notably the last 25 years, many more of these documents have been discovered, transcribed and printed, or published in *facsimile*, so that, including the missing versions, used or referred to therein, the catalogue has nearly 75 entries. These manuscripts have been grouped into families, because of certain characteristics common to two or more,—the whole forming a valuable collection of ancient masonic remains. Each manuscript consists of three parts: (a) the introductory prayer, declaration, or invocation; (b) the alleged history of the order, or the "Legend of the Guild"; (c) the peculiar statutes and duties, the regulations and observances, which masons in general, or the craft as a unit, were bound carefully to uphold and inviolably to maintain. The precise value of the "Old Charges" lies in the fact that they were the formulas used in the ceremonies of initiation by our masonic ancestors of from two to five centuries antecedent. All known copies are of English origin, even those used in Scotland; and, being of a distinctly Christian character, it has been thought they indicate ecclesiastical supervision and composition. A manuscript version of 1583 A.D., in possession of the United Grand Lodge of England, has the following "introductory prayer," and is quoted as an example:

The mighte of the Father of Heaven and ye wysdome of ye glorious Soonne through ye grace & ye goodnes of ye holly ghoste, yt bee three psons & one God, be wh vs at or beginning

MASONIC FRATERNITY

and give vs grace so to govrne vs here in of
lyving that wee maye come to his blisse that
nevrr shall have ending. AMEN.

Signs, tokens, and words, by which the masonic craft became differentiated from all other trades than builders do not appear in the earlier forms. In time, however, this initiation was exclusively its own; and in the Melrose manuscript 1581 A.D. (known to posterity by the transcript of 1674), reference is made to "Ye priviledge of ye compass, square, levell, and ye plum-rule." The early records show that the lodge system was used from the first as a bond to preserve the art of building as a monopoly. The secret of the organization was then,—in contradistinction to all others,—"the way to build"; and tyled lodges contributed best toward this end. But, in spite of every precaution, another body of operatives arose,—called "Cowans" by the regulars,—which in spite of its lack of prestige, not being in possession of "Old Charges" and the "mason's word," contrived to prosper, eventually breaking down the monopoly and prepared the way for the "speculative" society of modern times. The term "speculative" has reference to a class of members who were not operatives and had no intention of becoming artisans, but were denominated "accepted" masons. The admission of this element proved the wisdom of the fathers, and to it is probably due the permanency of the institution and its continuity to succeeding ages. By its influences the masonic fraternity secured governmental favor, and became "free of the guilds," that is, free of the restrictive laws, which, even now, regulate the "Friendly Societies" of the British empire,—enjoying a liberty which did not inhere in the organization of exclusively operative masons who were not *Free-Masons*, the so-called "Cowans." (Free + Mason, originally written as two words, not mentioned prior to the 14th century.) Just what proportion of the membership was speculative during the earlier or operative period, unfortunately is not known, the first lodge record preserved being of a meeting held "Vltimo, July 1599," but of its mixed character there is no doubt. Old records, recently discovered, and examined in the light of present-day research, have led masonic writers to revise the usually accepted assertion that the cathedrals and other public edifices in Great Britain, erected during the Middle Ages, were planned by church dignitaries. The opinion now obtains that the architects thereof were the Master Masons of that period,—the divisions among the builders of the operative era being apprentices, journeymen (Fellow Crafts), and Master Masons. Each man's work bore a distinguishing mark by which the piece could be identified, and the wage scale regulated. As for example:

York Minster Crypt

By the opening years of the 18th century the decadence of the society had become so great that four of the surviving masonic lodges proceeded to a reorganization in 1717 A.D., as before stated, and this movement is known in history as "The Revival." Four old lodges in London are known to have participated, and probably

others, but the minutes are not extant. Two divines, associated with these brethren, were destined to figure as masonic architects and authors of the new régime: James Anderson, D.D., born in Edinburgh, 5 Aug. 1684, a minister of the Scottish Presbyterian Church in Piccadilly, London; and John Theophilus Desaguliers, LL.D., F.R.S., of Christ Church, Oxford, who was born in Rochelle, France, 12 March 1683. Anthony Sayer, a distinguished gentleman, was installed Grand Master. He was of the "speculative" craft, and of the class called "accepted." The Grand Lodge instituted was a governing body, and in no wise a successor of the "General Assemblies" of the operative or legendary period. To Dr. Anderson was entrusted the duty of compiling the "general records and faithful traditions from the beginning of time," and to enable him to do so all the available documents were collected for his use. These were afterward destroyed,—an irreparable loss. In 1723 the "New Constitutions" were published, when it was discovered that Drs. Anderson and Desaguliers had completely changed the theory of the institution,—from Christian to the adoption of a universal creed based on the Fatherhood of God and the Brotherhood of Man,—so as to admit men of all religions, nationalities, and stations in life. These authors included likewise all that is now known of the transactions of the craft from 1717 to 1722 A.D., when the official records commence. The second edition of the "New Constitutions" was published in 1738, with "New Regulations" added, which became the basis of the Freemasonry of the present day. From 1717 the evolution of the society made rapid progress, both as to the increasing area of its operations, and in the multiplicity of its degrees. But the masons of "the revival" and their immediate successors did not long dwell together in unity. Those at York organized a "Grand Lodge of All England," in 1725, and kept it alive for some twenty years. A reorganization took place in 1761, and the body ceased to exist in 1792, never having chartered lodges outside of England. In 1751 a great schism occurred, whereby a part of the premier Grand Lodge withdrew and instituted a rival. In common parlance the latter body became known as "ancients," the former as "moderns," a transposition which is firmly settled in history. A deputation from the Grand Lodge of All England, dated 29 March 1779, created still another body called the "Grand Lodge of England South of the River Trent," and this survived until 2 May 1790. The two rival Grand Lodges,—*"Moderns"* and *"Ancients,"*—happily entered into a concordat on St. John's Day, 27 Dec. 1813 A.D., constituting the present United Grand Lodge of England, declaring that the English Rite of Freemasonry "Consists of three degrees and no more, namely: those of the Entered Apprentice, the Fellow Craft, and the Master Mason, including the Supreme Order of the Holy Royal Arch."

In Ireland no Grand Lodge records are extant of date prior to 24 June 1780 A.D. It is known that there was a lodge at Cork, the first minute of which is dated "December ye 8th, 1726." The city archives refer to a charter for a "Society of Freemasons," and a "Grand Lodge of Munster"; and it is known that other lodges existed prior to 1726. There was also a Grand Lodge of Cork, and one at Dublin. The last

MASONIC FRATERNITY

named was of record in 1728-1729; reorganized 1731 A.D., electing Lord Kingston, who is described as "Grand Master of all the lodges of Free Masons in the Kingdom of Ireland." Irish Masons possessed "Old Charges," and like their English brethren propagated the order far and wide. It was in Lodge No. 44, of Irish register, — warranted in 1735, — that the Hon. Mrs. Richard Aldworth (Elizabeth St. Leger), was initiated, and became the celebrated and only "Female Freemason" of history.

Scotland enjoys the honor of "Mother Kilwinning Lodge, No. 0," universally recognized as the oldest in existence. Its records comprise a minute of 1599, and others ranging from 20 Dec. 1642 to 5 Dec. 1758, A.D., and these communications were held in Kilwinning. Traditional history ascribes to the architects of the Abbey of Kilwinning the pre-eminence which inhered to the Masons of York, in England. A dozen other old lodges are of record, possessing fragmentary minutes and "Old Charges" of rare Masonic value, but the Scottish Craftsmen did not follow the examples set by England and Ireland until St. Andrew's Day, 30 Nov. 1736 A.D., when Baron William St. Clair of Roslin (Earl of Orkney and Caithness), was chosen Grand Master. The following year he was succeeded by George, the third and last Earl of Cromarty. It will be noted that in Scotland, as well as in England and Ireland, the craft was patronized by those of exalted civil rank and station. Scotland's "Masonic gem" is the "Prentice's Pillar," standing in the chancel of Roslin Chapel, Edinburgh.

An unsuccessful attempt has been made to connect, historically, the building crafts of Continental Europe with the Operative Masons of Britain and Scotland. But, in Germany, in pre-Reformation times, the "Independent Stonemasons" arose, coming out from the Monastic orders as the zeal for building magnificent edifices, under ecclesiastical patronage, declined. These "lay brothers" were possessed of "Old Charges," but no authentic documents remain which refer to their most flourishing period of existence. Within the short space, however, of from 10 to 20 years, subsequent to the revival in England, Masonry of the British type had obtained a foothold in all the countries of Europe. It had crossed the seas to America, and in a list of lodges published in 1734 A.D., No. 126, of English register, is shown as located at "Boston, in New England," — known since 5 March 1792 as St. John's Lodge.

Introduction and Early History in America. — It is a well-settled opinion that very early in the settlement of North America masons of the three classes, — operative, speculative, and the irregulars, — met in lodges, without much regard to warrants or charters, and these organizations continued until long after the revival in 1717, especially in the British colonies. Indeed, these assemblies of the craft were quite apart from regularity and the sanction of Grand Lodges. This was the fact in Philadelphia, in 1730-1; and, again, in New Hampshire soon afterward (the last named apparently having "Old Charges"), though nothing has yet been discovered to connect such meetings with the working of the "historic three degrees" of 18th century notation, and post-Grand Lodge era. This raises the mooted question as to

priority in the United States. On 5 June 1730, Daniel Coxe of Burlington, N. J., was appointed Provincial Grand Master of the "provinces of New York, New Jersey, and Pennsylvania, in America," by the Duke of Norfolk, Grand Master of the premier Grand Lodge of England. On 30 April 1733, Lord Viscount Montague, Grand Master, issued a like deputation to Henry Price of Boston, appointing him "Provincial Grand Master of the province of New England, the dominions and territories thereto belonging." Masonic history is obscure as to the part Coxe took in establishing the society, but there is a complete record of the acts of Price. Because of this, Massachusetts was acknowledged to be the "mother jurisdiction" for nearly 150 years; while documents now in the archives of the Grand Lodge of Pennsylvania, and "Libre B." of the Historical Society of that commonwealth, appear to give the primacy to the Keystone State. In support of this contention evidence discovered during the last half of the 19th century goes to show that on 29 Jan. 1731, Coxe visited his Grand Lodge at London, and that a toast was there drunk in his honor, as "Provincial Grand Master of North America"; that from 1732 and for several years, a list of Grand Lodge officers was regularly printed in the *Pennsylvania Gazette*, published in Philadelphia; that, in 1734, Benjamin Franklin being elected Grand Master thereof, wrote to Provincial Grand Master Price in Boston, as to the status of masonry in Pennsylvania; that in June of that year Franklin met Price in Boston and was recognized to the extent of being "further instructed in the Royal Art," by the Provincial Grand Master; and that Grand Master Franklin himself visited the Grand Lodge of England, 17 Nov. 1760 A.D.

The rival Grand Lodges in England, together with those of Ireland and Scotland, chartered lodges everywhere, at home and abroad. Patronized by the Royal family and nobility of Great Britain the craft acquired greater prestige than history records of any other society, and a system of "military lodges" fostered expansion. The roll of warrants issued during the 18th century and subsequent to 1730, would make a large volume. From these beginnings Grand Lodges were formed in America, composed of lodges of English ("ancients" and "moderns"), Irish, Scottish, and "Army" register, increased in number by those holding Provincial Grand Masters' warrants, together with lodges chartered by the earlier American Grand Lodges in the United States and Canada, until regular governing bodies existed in every State, province and territory. Thus the craft has "followed the flag," wherever unfurled.

Knights Templars and Masonry. — The tradition that the "Baldwin Encampment," which, up to the middle of the 19th century, had been conceded to be the witness that Masonic Knights Templars were descendants of the Knights of the Crusades, is not now accepted. Its earliest accredited document bears date 20 Dec. 1780 A.D. The first reference to the Knights Templars as allied to Masonry is contained in the (lodge warrant) minutes of St. Andrew's Royal Arch Chapter, Boston, Mass., dated 28 Aug. 1769 A.D.; the earliest in England is that of Phoenix Lodge, No. 257, Portsmouth, 21 Oct. 1778. Kilwinning Lodge of Scotland, on 8 Oct. 1779, by its master,

MASONIC FRATERNITY

Earl Eglinton, warranted the "High Knights Templars of Ireland," at Dublin. The Grand Lodge at York sanctioned the degree of "Knight Templar" in 1780. Similar references,—at dates between the St. Andrew's Chapter's record and the institution of the Grand Encampment, Knights Templars, U. S. A., 11 June 1816 A.D.,—may be found scattered throughout the fugitive minutes of lodges and chapters wherever the British army had been stationed. Whence, then, came the modern "Order of the Temple"? An answer, founded upon historical facts, has never been made. Two theories have been advanced: (a) It is within the range of possibility that a connection existed between the chivalric order of Knights Templars and the fraternity of Operative Masons of mediæval times, because bodies of skilled workmen erected Templar strongholds in the Holy Land, and built their preceptories, priories, and round churches in Europe. The famous Temple Church, London, is an example. What, then, was more natural than that the Knights Templars in the 14th century, proscribed, persecuted, and despoiled of all things, should seek their perpetuation among the affiliated bodies of mechanics of whose universality and antiquity they had abundant evidence? (b) On the other hand, no historical doubt exists that every Freemason living since the Revival of 1717 A.D., can trace his pedigree only to Great Britain. No other association, guild or otherwise, ever grew into a society of Freemasons, nor was any connection with the building trades of the Continent ever claimed by the first Freemasons of Europe. The craft there was a direct importation from England, and in its infancy and for many years, was confined to the upper classes, without the least admixture of the artisan. This was true in Germany, where the French language that of the court and diplomacy, was the one used in keeping minutes, and the early lodges bore French names. In 1740, however, in contradistinction to English, a Scottish Masonry arose,—reputed to hail from Scotland, but having no real connection with the regular society: and from this source have emanated most of the traditions relative to the alleged transmission of the chivalric degrees from the Knights Templars, of whom Jacques de Molai,—executed 11 March 1314 A.D.,—was the last Grand Master. In order to prove the Templar succession, and the legend of Scottish Masonry, it becomes necessary to account for an interregnum between the year 1309, when Walter de Clifton, Preceptor of the Scottish Knights Templars, admitted the dispersion of his brethren, and the date when modern Templary appears of record, during the 18th century, at Boston, manifestly a historical impossibility. Nevertheless, "history fails to record much that actually occurs; much that subsequent ages would gladly know." Notwithstanding, as late as 1854, an authorized edition of "The Templars' Chart," by Jeremy L. Cross, published in New York, gave a succession of Grand Masters from Jacques de Molai,—based on a clumsy forgery of the Swedish Templars,—to the year 1838 A.D. Like many another ingenious theory, framed to connect the "old" with the "new" dispensations, tradition may be true, but it is unsupported by documentary evidence.

Organization and Degrees.—Craft Masonry

Vol. 10—21

was universally organized on the bases that within itself was conserved all the powers of the entire Institution. A Grand Lodge once duly established must *sui generis* be sovereign in its jurisdiction, the bounds of which soon became restricted to a state, province, or other recognized political division. The territorial limits of a Grand Lodge being sacred from invasion, and this principle enforced, Masonry has escaped the successful competition of alleged rival rites purporting to be the craft itself, and also has been secure in its privileges from any and all plans to confederate these bodies into one centralized government,—a guaranty of the perpetuation of the democracy inherent therein. But the symbolism of "Solomon's Temple" as the most glorious edifice of ancient times, probably introduced by Drs. Anderson and Desaguliers (whether from the lost MSS., or otherwise, is not essential), required a more ornate adornment and furniture than a foundation and the bare superstructure upon which Operative Masons had wrought,—hence, naturally, suggested degrees above the original three of the Revival, *et seq.* For more than a century men toiled to perfect the society,—often building better than they knew,—until the three Rites became settled as at present established. The best minds contributed toward this end. As in the Old World, so in the New, the institution had attracted to itself men of high character and standing in the governments thereof, and men of letters contributed their full quota to develop the fraternity, which was expected to endure, as these promoters believe it had already existed, for ages. France, in particular, was prolific in the "fabrication" of degrees and rites, the great volume of which survive only in the musty tomes of 18th century literature. As before inferred, the so-called Scottish Masonry became the forerunner of a rite that, perfected by scholarly masons, ultimately became the Ancient and Accepted Scottish Rite. This title is now applied to a system which was first definitely organized at Charleston, S. C., 31 May 1801 A.D. The rite in several of its degrees can boast of a very respectable antiquity, having descended from a "Council of Emperors of the East and the West," at Paris in 1758. It is also based on the three craft degrees, and its postulants must be Master Masons in good standing, in whatever other regular rite they may hold membership. The original Supreme Council in America passed through an experience similar to that of the premier Grand Lodge of England before its authority as "Mother of the Rite" was fully established in the masonic world; but peace came finally, and two recognized bodies exist in the United States: the primate, as the "Southern Jurisdiction," and the present "Northern Jurisdiction," established by a concordat, signed at Boston, Mass., by several rival Supreme Councils, 17 May 1867. This rite was introduced into England in 1845; and other Supreme Councils of this obedience exist in Scotland, Ireland, Canada, Egypt, and colonies of Great Britain; in France and dependencies, and in other countries of Europe, excepting Russia; in South and Central America; and in the West Indies. As before stated, the masonic government is complex, no two rites,—nor even Grand jurisdictions of the same rite,—being alike, owing to variances in the sequence of their degrees. The English

MASONRY AND BUILDING

and American are substantially in unison as to chronological order: Craft, Capitular, Cryptic, and Chivalric degrees. In the American Rite its degrees follow this notation exactly, being the Lodge, Royal Arch Chapter, Council, and Templar systems, respectively. England, Scotland, and Ireland, working the English Rite, are not altogether in accord,—additional degrees and orders being incorporated,—but, eventually, all arrive at practical universality, nevertheless. The A.:A.:S.:R.: is divided into grades or degrees: symbolic (the three Craft degrees, which are not conferred, however, in jurisdictions of the English and American Rites), Ineffable, Historical, Philosophical, Historical and Philosophical, Chivalric, Official and Executive,—conferred in lodges, councils, chapters, consistories, and supreme councils.

Statistics.—In the United States and Canada the membership of Symbolic Masonry is published annually, the total for the year 1903 being 962,438, in 12,704 constituent lodges, under 57 grand lodges. The net gain during 1902 was 39,500. Abroad, the privilege of membership in two or more lodges militates against an accurate enumeration, but the returns show lodges as follows: Grand Lodge of England, 2,350; Grand Lodge of Ireland, 1,009; Grand Lodge of Scotland, 614.

HENRY LEONARD STILLSON, 32°,
Masonic Historian.

Masonry and Building. MASONRY, from the French, *maçonnerie*, meaning stone or brick work, derived from the Latin, *maceria*, a wall, is the operation and resulting construction, of laying up natural or artificial stones, generally held together or made a single mass by mortar, plaster or earth. It is the most important part of large building work, and a mason frequently becomes the general contractor for a whole building operation. The different trades required in mason building begin with building movers or the workmen who raze or demolish old buildings; then come the excavating, drainage grading, paving, piling, foundations, rubble, cut stone, including cut moldings, modeling and stone-carving, brick masonry, concrete work, fire-proofing, terra-cotta work. After this heavier construction follows lighter mason work: plastering on metal or wood lathing, and stucco. Other trades employed in completing a building are steel and iron construction, sheet metal work, carpentry, painting, and glazing. The ideal of good masonry is a structure of natural or artificial stone that

shall stand as the backbone of the building, firm and enduring; its great first cost shall mean no further care or expense.

History.—The Egyptian stonework was generally of enormous blocks jointed with astonishing accuracy, so as not to mar the effect of the bas-reliefs which covered several courses. Assyrian walls were laid up with bricks forming the exterior surface and the interior was filled with earth. The early Greek or Pelasgic walls were followed by more developed forms such as those called *ισόδομος* and *ψευδοισόδομος* which became the Roman *Isodomum* and *Pseudisodomum* walls. *Opus reticulatum* and *opus incertum* were later Roman forms where small blocks of tufa or triangular brick were used for the exterior surface and the interior was filled with concrete. The characteristic of Greek masonry was to use local stone, accurately cut and jointed if the stone would bear it; otherwise covered with stucco. From the lintel or beam architecture of the Greeks to the arch construction of the Romans was an advance in the possibility of size of construction, but a change from a system of making the constructive forms visible and decorative to a custom of covering rough walls with a decorative shell not expressing the supporting masonry work behind. This method of building, however, gave the Romans an opportunity to make their enormous structures at a much less comparative cost, because unskilled labor could be employed to much better advantage, needing only a small number of foremen. Romanesque masonry was very crude and the thrusts of the arches were taken care of by a mass of abutments which were practically monolithic. In Byzantine work, however, the arches and domes were made from small blocks of stone and the thrusts were studied with much greater care. In Gothic work the arch became "alive," carrying the weights and thrusts of the upper parts of the building on slender shafts, and through flying buttresses with the utmost skill to the outer walls and buttresses. Modern work has come to partake of the character of the ancient Roman construction, that is, a veneer on interior supporting masonry of a different character. In our time, however, instead of the huge concrete monolithic buildings, an iron skeleton is used, and a thin shell often not more than four inches in thickness covers a framework of steel beams that in a high building is little more than an iron bridge on end. The old Roman flat arch construction of thin bricks or tiles held together by strong cement forming domes not over six inches thick and easily spanning 15 feet or 20 feet is also used. Brick and terra-cotta are increasing in quality and variety and are admirable for covering steel construction.

Men and Material.—The workmen employed on masonry are as follows: stonemasons, who generally work in stone yards away from the building, except for such trimming as may be necessary in setting the stone; stonemasons who work on the building, setting the stone, and bricklayers. Besides these, laborers are needed for delivering the stone, mortar, etc., and for mixing mortar and concrete. The materials used are such substances as stone, brick, terra-cotta, broken stone, cinders; and adhesive materials: limes and cements, which are used with sand to make a mortar for binding the materials together. In very crude con-

MASONRY AND BUILDING

struction, mud and clay are used for a binding material. Foundation walls may be of stone laid dry; of concrete; of stone laid in Portland cement mortar or half-cement mortar, the latter consisting of sand, cement, lime, with cement and lime in equal proportions. In case of the soil under the building not being sufficiently firm, it is necessary either to drive wooden piles or to spread the foundation so far that the pressure per square foot on the soil will not be sufficient to cause the building to settle. In Chicago the footings are very large, of steel beams and concrete, making what is practically a raft so that the building really floats on a soft soil. Where the foundations are under water, as under a bridge pier, it is necessary to adopt special methods, generally sinking caissons so that workmen may go down and work under water.

Ashlar Facing.—The stone work of the outer face of a wall when it is cut and differs in character from the back of the wall is called *ashlar*. The coursing of ashlar is done in different ways. The simplest form is when it is laid out in continued courses. In this case it is called "regular coursed ashlar." Ashlar is also laid without long horizontal joints. In this case it is called "broken ashlar." This is generally used when stone cannot be easily obtained of equal heights. It takes longer to lay this up, which makes it cost more than the regular courses, but makes a very attractive looking wall, having more freedom and texture. It is customary to cut the stone at the stone yard certain heights; for example, 2, 4, 6, and 8 inches so that they can be laid up without cutting any joint except the end joint, at the building. From 3 to 6 different heights are generally used, the larger number giving more variety than when the smaller number of sizes is used. Stone work is sometimes laid Flemish bond, similar to Flemish bond in brick work.

Coursed random ashlar has horizontal joints $\frac{1}{2}$ to 2 feet apart, continuous. Between these joints the stone is laid up irregularly. The other stone on the walls of a building are called trimmings, which include the molded work, the window sills, jambs, and the quoins, which are the cornerstones of the building. The quoins and jamb stones, if of the same material, may be included with the rest of the ashlar. The part of the wall back of the ashlar (called the backing) is of cheaper stone or brick. It is never under 8 inches thick when of brick, and if of stone the backing is thicker. This should be built and bonded in at the same time as the ashlar in order to make a solid wall. If the stones are not high, the thickness of the ashlar should vary so that the backing can bond in and it is generally specified that the ashlar should include one through bond stone in every ten square feet of wall. If the facing is thin (2 inches to 4 inches), the pieces are clamped back into the backing by iron clamps. Random rubble is where untrimmed stones are used, and selected to fit as well as possible.

In public work and important buildings, every stone should be shown on the drawings, except when random ashlar is employed. In this case the arrangement of the stone is made by the foreman on the building, to follow a sample piece of ashlar set up and approved by the architect, instead of being shown on the drawings. Ashlar is usually from 4 inches to 8 inches

thick. In figuring the quantity an average of 6 inches in thickness is generally taken. The heights vary from 10 inches to 14 inches. For exterior work the ashlar should not be under 4 inches thick. The ashlar may be laid with V joints, or with rustication. In the latter case the face is generally rock-face or pointed and a draft-line 1 inch wide is carried around the edge of the stone.

Bond stones are stones that go into the wall to hold the wall together. If there are many small stones these should be frequent. In laying out ashlar the bond should be arranged to give effective stone jointing. Bond stones the full size of a pier are frequently used for caps and also placed at intervals through the pier.

Brickwork.—In brick work, the bricks are laid so as to distribute the load and tie the different portions of the wall together. Stretchers are brick which are laid showing their long side. Headers show the end of the bricks. Common bond is to lay the brick with stretchers for five courses and then lay headers for the sixth course. Face brick bond is as a rule laid of stretchers and bonded either by clipping the corners of the bricks, which ties the face of the wall to the backing or with metal wall ties, which are made of wire, crimped metal, or of tin fastened to steel wire. Flemish bond is the bond which is most frequently used to give an interesting wall surface, more pleasing than what is obtained with common bond. It is laid up with alternate headers and stretchers. The small piece inserted at the corners is called a closer. English bond consists of courses of headers and stretchers alternating. A variety of this, called English cross bond, has the alternate courses of stretchers arranged with the joints below the middle of the bricks above, making a figure resembling a cross. Sometimes every fifth course of brick is laid Flemish bond with the others straight bond. Every fifth course may be set in an inch, forming rusticated work. When walls have hollow or "vaulted" spaces not over 2 inches wide in the centre the bond is made by bricks laid across the space and cut in diagonally, or by the use of metal ties every four to eight courses. In arches, the face of the arch is made with the same bond as that shown on the wall. Common arches are made with successive rings or rowlocks, of headers.

Bricks.—Bricks at the present time are being used more and more in construction, as they are not affected by the weather, fire, or city atmosphere, which affects the softer building stones seriously. They are cheaper than stone and can be used with cut stone or terra-cotta trimmings. Hard burned bricks are used for piers, though not so good for this purpose as stone work, and in very dry soils are sometimes used for foundation walls. If there is any dampness of the soil, the outside of brick foundation walls is sometimes painted with water-proof paint. Bricks are made from sand and clay, the clay in different localities making bricks of different characteristics. A sandy clay is most desirable. For the better kinds of brick, clay is often chosen from different places and combined with the greatest care. The customary way of making bricks is to throw the clay into a large open space where it can be dumped from carts which take it from the clay bank, where it is excavated. It is ground and mixed by

horse-power, water being poured in and making it all soft so that it can be pressed into molds, and sand is added as needed. If the molds in which the bricks are made are dipped in water before the clay is pressed into them, the bricks are called "water-struck" bricks. If the molds are dipped in fine sand so that the clay will not stick, the bricks are said to be "sand-struck." This method gives a better formed brick than water-struck. The molds are taken to a smooth yard and laid in the sun where they are allowed to dry several hours, being usually sprinkled with sand and turned. Then they are piled in large piles and arranged so that fires can be built to burn until hard. The bricks next the fire, which have generally burned ends, are called "bench bricks," while those farthest from the fire next to the outside of the kiln are called "light hard" bricks. Machines are gradually replacing this primitive form of making bricks, the whole process being carried through with little hand labor from the time of the steam shovel taking the clay from the bank until the finished brick is taken from the kiln. There are several kinds of machines, one forcing a continuous stream of clay through a die the size of a brick, while a knife on a revolving wheel cuts off bricks the proper length from this continuous line of clay. Another method forces the soft mud into a series of molds, which are taken out on the drying yard while other moulds are placed in the machines. Sometimes these bricks are taken and put in another machine which represses and re-forms the brick into a truer form; this does not, however, increase the strength of the brick. Another machine takes the clay dry, and after grinding, subjects it to great pressure, making a so-called pressed brick. These bricks are more expensive than the others and have a smoother surface and nicer finish. The latest form of kiln is a series of sections arranged so that all stages of the operation are going on at the same time, the heat, after burning one section, being passed through to dry the brick just put in another section, while still other parts are being emptied or re-filled. Terra-cotta and pottery are burned in kilns which are arranged to let in heat half way up the kiln so that it will be drawn down on to the pile of terra-cotta and through the floor of the kiln into the chimney. This is said to give a more even heat. If there is iron in the clay the color of the brick will be red: the ordinary white bricks are generally due to lime. The proportion of iron makes the red of various shades, according to the amount. Lime and iron make a cream-colored brick. Brown bricks are due to the presence of magnesia; and magnesia and iron make a yellow brick. Different clays give varying color effects, and the mixture of clays with mortar colors, or painting the exposed surfaces, gives desired effects. Bricks should not absorb more than from 1/20 to 1/10 of their weight of water. This is a test that can be easily applied. Soft bricks may absorb as much as a quarter of their weight. Bricks should ring when struck, as cracked or soft bricks will give a dull sound. They should not have any cracks or large lumps or foreign substance, such as lime or coarse gravel. They should run all the same dimensions with true surfaces, though for rustic work, rough bricks are often desired. The approximate size of a brick is 2"x4"x8". In the Eastern States

7 3/4" x 3 3/4" x 2 1/4"; but in the Western States the dimensions are slightly larger. In every case where brick work has to be figured for cutting stone trimmings, the brick should be laid up and measured. Pressed brick are generally 8 3/4" x 4 1/4" x 2 3/8" in size. Roman brick is 12 inches long and 1 1/2 inches thick. Norman brick is 12 inches long and 2 inches thick. Bricks weigh four or five pounds apiece.

Masonry (Fraternity). See MASONIC FRATERNITY.

Masoola, mā-soo'la, a boat common on the east coast of India, adapted to be beached on the surf-beaten shore. The planks are sewed together with coir, over wads of the same material, which press upon the seams. The boats are 30 to 35 feet long, 10 to 11 feet beam, 7 to 8 feet deep, and are rowed by 12 men, oars double banked, and a steersman with an oar at the stern.

Masora, mäs'ō-ra, or **Massorah**, a Hebrew word signifying "tradition," the name of a collection of notes referring to the Hebrew text of the Old Testament, and written in Chaldee chiefly on the margin of Hebrew MSS. These notes are various in their character, critical, grammatical, and explanatory. At what time the accumulation of these notes was commenced cannot be ascertained. According to some Jewish writers the notes are in some cases as old as the time of Moses; according to others they were begun in the time of Ezra. A useful edition of the Masora is the translation of Dr. Ginsburg (3 vols. 1880-7).

Maspero, Gaston Camille Charles, gäs-tōn kä-mél shär'l mäs-pë-rō, French Egyptologist: b. Paris 23 June 1846. He studied in the Lycée Louis-le-Grand, 1853-65, and before entering the Ecole Normale in 1865 had already made considerable progress in the study of Egyptology. He remained in the latter college two years and attracted the attention of Mariette, the distinguished Egyptologist. In 1867 he published in the *Revue Archéologique* an Egyptian text and translation under the title 'Stèle du Songe,' and in the same year appeared separately his 'Mémoire sur la grande Inscription d'Abydos et la Jeunesse de Sésostri.' On leaving the Ecole Normale he went to South America to carry out researches in the Quichua language. Further memoirs on ancient Egypt extended his reputation and secured his appointment in 1869 as professor of the Egyptian language and archaeology at the Ecole des Hautes Etudes. In 1871 he issued an important essay, 'Des Formes de la Conjugaison en Egyptien ancien, en Démotique et en Copte'; and in 1873 'De Carchemis Oppidi Situ et Historia antiquissima' and 'Du Genre épistolaire chez les anciens Egyptiens.' In 1874 he succeeded Rougé as professor of Egyptian philology and archaeology at the Collège de

France. Sent to Egypt in 1880 as head of a government archaeological mission, he succeeded Mariette in the following year in the directorship of excavations and antiquities. He founded and directed an archaeological institute at Cairo, had charge of the museum at Bulak, now in Gizeh, carried out many excavations, with important results, and in 1886 returned to France to resume his duties at the College. In 1899 he again went to Egypt as director of excavations and antiquities. Maspero's great work is his 'Histoire ancienne des Peuples de l'Orient' (1875), which has been republished in an enlarged and revised form (1894-9). The three volumes of the later edition have been translated into English under the titles 'The Dawn of Civilization' (1894), 'The Struggle of the Nations' (1896), and 'The Passing of the Empires' (1900). His other works comprise the following: 'Contes populaires de l'Egypte ancienne' (1883), translated by him; 'Etudes Egyptiennes' (1886-91); 'Archéologie Egyptienne' (1887; Eng. trans. 'Egyptian Archaeology' 1888); 'Lectures historiques' (1890; Eng. trans., 'Life in Ancient Egypt and Assyria,' 1892); 'Etudes de Mythologie et d'Archéologie Egyptiennes' (1893), invaluable to the student of the religion of ancient Egypt; besides contributions to the 'Mémoires' of the French Archaeological Mission at Cairo, etc. In 1879 Maspero was made a knight of the Legion of Honor, and in 1895 commander. Since 1883 he has been a member of the Académie des Inscriptions, and in 1887 became an honorary fellow of Queen's College, Oxford, and an honorary D.C.L. of that university. See EGYPTOLOGY.

Masque. See MASK.

Masquerade, mäs-kë-räd', a popular amusement, in which persons of both sexes mask or disguise themselves, and engage in dancing, or festivities. Masquerades are said to have been the invention of Granacci, an Italian, who lived in the beginning of the 16th century. See CARNIVALS.

Mass, in physics, the quantity of matter in a body. The mass of a body is the same wherever the body may be in the universe. Two bodies have equal masses if the gravitating forces with which another body acts upon them are exactly equal at equal distances. (See GRAVITATION.) Hence two bodies have equal masses if their weights are the same at the same place on the earth; so that if the metallic "weight" used by a grocer is carried from place to place, the quantities of sugar and tea balanced by it in a good pair of scales will always be the same, for the mass of tea or sugar is in every case equal to the mass of the metallic "weight." It is to be clearly understood that as the force of gravity is different at different places on the earth, the weight of any body is different at different places. To distinguish between the mass (or quantity of matter) and the weight (or force which tends to move it downward) of a body is very important in beginning the study of physics.

Mass, in the Roman Catholic Church, the celebration of the eucharistic sacrifice with all the prayers and ceremonies accompanying it. Roman Catholics believe that the mass is the unbloody oblation of the body and blood of Christ, under the appearances of bread and wine, in praise, adoration and thanksgiving to God.

The word *mass* is of Latin origin, though attempts have been made to derive it from Hebrew sources, but ineffectually. It comes from the Latin word *missa* "sent," which is the participle of the verb *mittere*, "to send." *Missa*, according to some, may mean prayers sent to God or the sending or offering up of the sacrifice to God. But the commonly accepted, and no doubt correct, origin of the term is from the expression in the liturgy, used to dismiss first the catechumens after the gospel and the sermon, and then, the faithful at the end of the service: *Ite, missa est*; "Go, the meeting is dismissed." In the early Church when the Discipline of the Secret (q.v.) was part of the Church's economy in self-preservation against a virulently hostile paganism, the catechumens, that is, converts in course of instruction, were not permitted to remain through the more sacred parts of the eucharistic service; these were reserved for the faithful alone, who were fully acquainted with the profounder mysteries. The first part of the service was therefore called *missa catechumenorum*, the mass of the catechumens, and the second, *missa fidelium*, the mass of the faithful; and so, in the sequel, the entire service received the name of *missa* or mass. After the stress of persecution had relaxed and the need of the enforcement of the Discipline of the Secret had passed, the dismissal of the catechumens ceased, and all were suffered to remain throughout the entire ceremony.

At first the bishops and priests celebrated together, but as the number of the faithful increased, and communities of Christians rose, not merely in the cities, but also in the villages, priests celebrated the divine service independently; at first they officiated only before the whole community, and on days appointed for the purpose; at a later period also on ordinary days, and even alone, for their own benefit, with the assistance of one altar servant only. Thus originated with the high or solemn mass also the private mass, performed by the priest, assisted by one altar servant only. The celebration of the eucharistic sacrifice, or the mass, separate from the preaching, became more and more common, the people participating only in the public services. In the private mass the responses, etc., were made by a servant of the altar, and the priest alone took the sacred elements. It is now the law of the Church that in all private masses the priest must have one server to represent the body of the faithful. What is called Solitary Mass, that is, where no one is present to make the responses, is now forbidden. The priest, who celebrates, always communicates for the integrity of the sacrifice; but it is not necessary for any of the congregation to do so.

The mass consists of four chief parts:—1, the introduction is called the *evangelium*, or gospel, and formerly constituting, with the sermon, the mass of the catechumens; 2, the *offertorium*, or the oblation of bread and wine before the consecration; 3, the consecration or transubstantiation, when the elements of bread and wine are changed into the body and blood of Christ; 4, the communion. These four chief parts, of which the latter three are considered the most essential, are composed of several smaller parts, each having its proper denomination; they consist of prayers, hymns, shorter and longer passages of the Holy Scriptures, and a number of ceremonies, which, as the essential

MASSA — MASSACHUSETTS

point of the mass is the sacrifice of the Lord, consist partly of symbolical ceremonies commemorative of important circumstances in the Saviour's life, or signs of devotion and homage paid to the presence of the Lord in the host. The order of these ceremonies, and of the whole celebration of the mass, is given in the missal, or mass-book. The masses are modified according to many circumstances. Thus certain parts are changed according to the saint in honor of whom the mass is celebrated, or the seasons of the year connected with different events in the Saviour's life, or the purpose for which the mass is said, as the *missa pro defunctis* (mass for the dead). The *mass of the day* is such as is proper to the season, or to the feast which is celebrated. *Votive mass* is one which does not correspond with the office of the day, but is said by the choice of the priest. *High mass* is that which is sung by the priest assisted by a deacon and sub-deacon or other clergy and the responses sung by the choristers, generally accompanied by musical instruments. *Low mass* is the ordinary mass celebrated by the priest without music. Mass must not be said before dawn nor later than mid-day, and priests are strictly prohibited from saying it more than once a day, except on Christmas, or in such countries where, owing to a lack of priests, two masses are required on Sunday that the people may fulfil their obligation of assisting at it.

Massa, mäs'sä, or **Massa di Carrara**, Italy, the capital of the province of Massa e Carrara, situated on a hill three miles from the Gulf of Genoa, and 20 miles by rail southeast of Spezia. It is an episcopal see, has a cathedral, public library, and academy of arts and sciences, and an ancient ducal palace now used as the prefectural building. The chief industry is the quarrying of the superior white marble in the vicinity; tobacco, silk, cotton, paper, and oil are manufactured. Pop. (1901) 26,413.

Massachuset, mäs-a-choo'sët, a tribe of North American Indians of the Algonquian stock, formerly living in the neighborhood of Massachusetts Bay, between Salem and Plymouth. A pestilence in 1617 greatly reduced their number and they gradually disappeared. See ALGONQUIN; INDIANS.

Massachusetts, one of the 13 original States of the Union, and the most populous of the New England States; between lat. 41° 14' and 42° 53' N., and between lon. 69° 55' and 73° 32' W. from Greenwich. Its greatest length is 184 miles and greatest breadth 113¾ miles, the average breadth being 47¾ miles. Capital, Boston. Population (1900) 2,805,346. Its familiar name "The Old Bay State" is due to its location upon Massachusetts Bay, an inlet of the Atlantic Ocean which forms the eastern boundary of the State. It is bounded on the north by the States of New Hampshire and Vermont; on the west by the State of New York; on the south by the States of Rhode Island and Connecticut, together with the Atlantic which, skirting the southeastern coast, forms between the outlying islands of Martha's Vineyard and Nantucket, belonging to the State, a broad waterway known as Nantucket Sound and an inlet called Buzzard's Bay, beyond the eastern extremity of Long Island Sound. The name "Massachusetts" is compounded from Indian words meaning "Great

Hills Place," alluding probably to heights of land near the coast in the vicinity of Boston. The present State seal, adopted in 1780 in place of other devices previously in use, shows an Indian holding in his right hand a bow and in his left an arrow pointing downward, all of gold, displayed upon a blue shield, and in the upper corner, above the right arm of the Indian a silver star having five points. The motto, adopted for Massachusetts by the Provincial Congress in 1775 is, in Latin, "*Ense petit placidam sub libertate quietem*," or in English, "With the sword she seeks quiet peace under liberty."

Topography.—The area of the State comprises 8,315 square miles, 8,040 square miles being land surface, and 275 water. A portion of the Appalachian Mountain system forms two distinct ranges crossing the western part of the State from north to south. Of these, the Taconic range on the extreme western border has as its highest elevation Mount Greylock (3,535 feet) in the northwestern corner of the State, which is also the highest elevation found within Massachusetts. Thence the range falls to an elevation of 2,624 feet near the southwestern corner. The other or Hoosac range farther east has, as its highest peak, Spruce Hill (2,588 feet), its general height ranging, however, from 1,200 to 1,600 feet. Mount Tom (1,214 feet) and Mount Holyoke (955 feet) are conspicuous elevations rising above the valley of the Connecticut River. Mount Wachusett (2,108 feet) and Mount Watatic (1,847 feet) in the north central part of the State are also noteworthy. An elevated plateau, 1,100 feet high at its greatest elevation, forms the central portion of the State and slopes gradually toward the east, the highest point near the coast being the Great Blue Hill of Milton (620 feet). The sandy peninsula or arm of land known as Cape Cod is a distinguishing feature of the topography of the State, enclosing between the bend and the main coast the considerable body of water known as Cape Cod Bay. The main coast line, some 300 miles in extent, affords excellent harbors, especially at Boston, New Bedford, Gloucester, and Salem.

Rivers and Lakes.—The principal rivers are the Connecticut, crossing the State from north to south, approximately 40 miles east from the western boundary; the Housatonic, flowing south, and the Hoosac, north, between the Taconic and Hoosac ranges; and the Merrimac, in the northeastern part of the State, having its source in New Hampshire and flowing into the Atlantic on the eastern coast. These rivers, except the Merrimac for some 15 miles from its mouth, are not navigable for shipping; but together with the Deerfield, Westfield, Chicopee, and Miller's River, branches of the Connecticut, the Nashua, and Concord, branches of the Merrimac, the Blackstone flowing from the centre of the State southerly across the Rhode Island boundary, and numerous other small streams, afford waterpower of the highest efficiency which has been fully utilized in the industrial development of the State and contributed largely to the extension and growth of manufacturing, the chief source of the wealth of its people. The Mystic and Charles rivers, flowing into Boston Harbor, and the Taunton, entering the bay at Fall River, are tidal streams each navigable for a short distance inland. There are numerous small lakes or

MASSACHUSETTS

ponds throughout the State, adding much to the beauty of the landscape, and, in many cases, utilized as sources of water supply for the inhabitants.

Geology.—The rocks are principally metamorphic of the Archaean and Palaeozoic systems. In the river valleys and elsewhere there are masses of glacial drift, including sand and boulders, some of the latter being of large size. No mineral deposits of great value exist, except stone for building purposes, limestones, and sandstone of the highest quality being quarried in the Connecticut Valley and west of the Connecticut, and granite of several varieties and superior character at Cape Ann, Quincy, and to a lesser extent in other eastern sections. The elevations of the lower Connecticut Valley are composed of bolerites, feldspathic, and calcareous gneiss. There are extensive Mesozoic sandstone beds and shales in the Connecticut Valley, with small areas of syenite on each side, and an area of gneiss extending easterly from the Connecticut to the central part of the State. Syenite and porphyry are found in the east; feldspathic gneiss and granite in Plymouth and Bristol counties; gneiss and hornblende schist in Middlesex County; syenite in Essex and Norfolk counties; carboniferous deposits in Bristol and Plymouth counties, and Cambrian, Silurian and Devonian limestones, quartzites, schists, and slates west of the Connecticut.

Climate and Scenery.—The temperature is variable, and, especially in the eastern parts of the State, subject to frequent and wide fluctuations. In the early spring easterly winds prevail upon the coast, which are peculiarly trying to persons of delicate constitution. The winters are moderately severe, although near the sea there is much mild weather, during the winter months, and the fall of snow is not excessive. The summers are frequently marked by periods of excessive heat, and sometimes by prolonged drought. The mean average rainfall for the State is about 48 inches. The normal temperature rises above the freezing point at Boston about March 7, and the normal temperature of 60° for the day reaches Boston about May 24. It falls to 60° about September 25. Observations extending over 25 years show that upon the average experience the warmest week at Boston follows July 13. On the other hand, the coldest week follows February 24.

The scenery in the western counties is exceedingly picturesque, notably in the valleys of the Connecticut, Hoosac, Deerfield, and Housatonic rivers. Here are found the noted Berkshire Hills. The northeastern coast line extending southerly from Cape Ann is bold and rocky, while the southern and southeastern shores of Cape Cod and Buzzard's Bay are low and sandy. The islands of Martha's Vineyard and Nantucket, and the group known as the Elizabeth Islands, partake of the characteristics of the neighboring mainland.

History.—The native inhabitants of Massachusetts were Algonquins of various tribes, each having its distinguishing name. The Indian nomenclature of hills, rivers, lakes, and local districts is still preserved in many cases. The first fully authenticated visit of a European explorer is that of Bartholomew Gosnold in 1602, although there are traditional accounts of the visits of others, particularly of Northmen under Leif Erikson, some 600 years earlier, with sub-

sequent settlements maintained during three centuries, of which, however, no undisputed traces exist, although a commemorative tower erected on the Charles near Boston is claimed to mark the site of a Norwegian settlement named Norrembege. Gosnold skirted the coast from Salem southward, named Cape Cod, and discovered the neighboring islands. A settlement made upon one of these was soon abandoned. Subsequent attempts at settlement by Prynne, 1603, and Waymouth, 1605, also failed. The Pilgrim Fathers, so-called, a company of English separatists who, seeking religious freedom, had, under the guidance of their pastor, John Robinson, left England for Leyden in Holland in 1607-8, sailed from Delfthaven in 1620, and soon afterward, 102 in number, from Plymouth, England, in the Mayflower (q.v.), with the intention of forming a settlement south of the Hudson River. Under stress of weather, however, they were forced to land in Provincetown Harbor 11 Nov. 1620, and finally upon the mainland at Plymouth 11 December (old style), where a settlement was established under a constitution or compact signed by all before leaving the ship, John Carver being chosen governor for one year. Despite much hardship this settlement was never abandoned and formed the basis of the Plymouth Colony.

A settlement made at Cape Ann in 1623 by English fishermen was in 1626 abandoned in favor of a location at Salem. A company of English Puritans under John Endicott, having obtained a grant of land on Massachusetts Bay, joined them in 1628. Under a charter granted the following year the Colony of Massachusetts Bay was firmly established. In 1630, the colony received large accessions under John Winthrop, and the seat of administration was soon transferred, first to Charlestown and finally to Boston. These two colonies, Plymouth and Massachusetts Bay, advanced side by side, the last named growing in importance by constant accessions, although less tolerant than the former in religious matters. The original government was indeed theocratic, based upon the Congregational form of church government, which was established by law in 1651. A confederacy including the two colonies and that of Connecticut was formed in 1643, followed by one upon a somewhat broader basis in 1663.

In the Massachusetts Bay Colony religious intolerance was frequently exhibited during the early years. Roger Williams and others whose opinions were thought to be dangerous to the community were banished.

Troubles with the Indians, the original inhabitants of the country, involved both colonies, the more important being the Pequot War, 1636-7; and the war with King Philip, 1675-6. Gradually relations with the mother country became strained. After the restoration of Charles II. a royal commission was appointed to administer the government, but was prevented from exercising its powers by the colonial authorities. The English High Court of Chancery in 1684 declared the charter of Massachusetts forfeited; and a succession of governors appointed by the Crown administered the colonial government, generally with much friction engendered by an adverse public opinion. Plymouth and Massachusetts Bay Colonies were consolidated under a new charter in 1692. The territory of Maine, New Hampshire, and Ver-

MASSACHUSETTS

mont formed part of the original province, separation being progressively accomplished and finally completed by the creation of the independent State of Maine in 1820.

In the colonial wars between France and England, and in difficulties with the Indians prompted by French influence adverse to the English colonies, Massachusetts was largely involved. Especially in the French and English wars, 1744-8 and 1758, the colony took an important part, contributing in great measure to the success of the expedition against Louisburg and other Canadian campaigns. In these military operations, the colonists learned to estimate their strength justly, and acquired experience which was of great value in the final struggle which resulted in independence.

Measures of taxation devised by the home government, and restrictions upon the growing commerce of the colony led to a constantly increasing spirit of resistance, and, finally to riots in Boston, 1765-8, against the enforcement of the Stamp Act (q.v.). In 1770 three citizens of Boston were shot by British soldiers, part of a garrison quartered upon the town without consent of the people. In December 1773 a cargo of tea, subject to a duty disliked by the colonists, was destroyed by being thrown into the harbor of Boston by a company of townspeople disguised as Indians. This episode is now widely known as "The Boston Tea Party" (q.v.). The port of Boston was closed in retaliation. The meeting of the General Court at Boston being postponed indefinitely, its members assembled at Salem. On 19 April 1775 the first blood of the Revolution was shed at Lexington not far from Boston, followed by the fight at Concord bridge. On 17 June occurred the battle of Bunker Hill at Charlestown, which, although counted as a British victory, exhibited the effective strength and stubborn power of resistance of the colonial forces, who, about 1,200 in number, resisted more than 3,000 British regulars, only giving way when after the third assault their ammunition failed. Throughout the war, Massachusetts took a prominent part, notwithstanding the emigration of a considerable number of loyalists to the Eastern British Provinces. She provided 67,907 troops and \$820,000 in revenue. At the close of the war, Massachusetts entered the Union, its State constitution being adopted in 1780 and the Constitution of the United States ratified January 1788. In the naval operations incident to the war with England in 1812, the seamen from Massachusetts won especial credit.

The State was closely identified with the anti-slavery movement by the growth within her borders of a strong popular sentiment in favor of abolition. William Lloyd Garrison (q.v.), Wendell Phillips, and many other prominent men, were influential in this movement.

In the War of the Rebellion the State furnished 159,165 men to the Union army and navy, paying in bounties and interest on bounty loans more than \$26,000,000, besides large sums in State and military aid. At the close of the war, the war debt of the State approximated \$15,000,000. In the recent war with Spain the patriotic record of the State was well maintained, its quota of men being promptly furnished, and among those first in the field.

Population.—The yearly rate of increase in the population of the State is about 2.5 per cent.

The industrial development of the last 30 years has stimulated the growth of factory towns and the population is now 76 per cent urban, that is, concentrated in cities and towns having 8,000 inhabitants or more. Since there are upon the average 348.9 persons per square mile of land surface the population is more dense than in any other State except Rhode Island. Although many persons born in Massachusetts have emigrated to other States, 299,614 such persons having been found in other parts of the country in 1900, nevertheless the loss has been more than compensated by accessions from abroad, from Canada, and indeed from adjacent States of the Union. The native born in the population numbered 1,959,022 and the foreign born 846,324. The increase in the native born in 1900 as compared with 1890 amounted to 23.8 per cent as against 28.8 per cent increase in the foreign born.

The number of foreign born does not of itself fully indicate the effect of immigration upon the population. This is more clearly shown by the number of persons of foreign parentage, which in 1900 aggregated 1,737,229, white persons only being considered. Less than a half of the inhabitants therefore are now of wholly native parentage.

The following table shows the place of nativity of the more numerous classes among the foreign born, and also the number of persons in the population having one or both parents born in the countries named:

PLACE OF BIRTH	Foreign Born Persons*	Persons having one or both parents foreign born
Ireland	249,916	647,591
Canada (English)	158,753	231,586
Canada (French)	134,416	244,586
England	82,346	149,887
Sweden	32,192	49,595
Germany	31,395	71,831
Italy	28,785	41,771
Russia	26,963	49,712
Scotland	24,332	49,596
Poland	19,971	29,412

Of the entire population 98.7 per cent is white, the remainder being persons of negro descent, Chinese, Japanese, and Indians. The growth of population and its concentration have led to the incorporation of numerous cities, of which there are now 33, as against 320 towns. Although the towns numerically preponderate, nevertheless more than 67 per cent of the entire population is now under city government. Dense as the population is when considered in the aggregate this density is confined to the cities and towns engaged in manufacturing, or which share in the residential growth promoted by the metropolitan city of Boston, which of itself has extensive miscellaneous industries. The area of the cities and towns having a population in excess of 2,500 in 1900 is, approximately, 3,395 square miles, and the population within such places shows a density of 756.14 persons per square mile. Outside of these places there is in the Commonwealth an aggregate area of approximately 4,645 square miles of land surface, more than a half of the entire area of the State, containing a population of but 238,248 persons, or an average of but 51.29 persons per square mile. Every census since 1875 has shown a considerable increase in population upon the territory occupied by towns above the

MASSACHUSETTS.

STATE CAPITOL AT BOSTON.

MASSACHUSETTS

2,500 limit in 1900, and conversely, an almost constant decline in the towns outside this area. The towns which have lost are the smaller agricultural towns of the State, and while the increase in the percentage of foreign born, proportionately to the total population, has been greater in these places than in the other cities and towns, nevertheless the population in them remains to-day as in 1875 largely native born. The persons of foreign birth rapidly become assimilated and take their place in the social and political as well as in the industrial life of the State. The presence of this element has been due very largely to the industrial development of the Commonwealth, but that part of it which appears in the smaller towns is due to the taking up of agricultural land by persons of foreign birth.

Chief Cities and Towns.—The following table shows the cities of the State, arranged in order of size, with the population native born, foreign born, and total, from the census of 1900:

NAMES OF CITIES	POPULATION		
	Native Born	Foreign Born	Total
Boston	363,763	197,129	560,892
Worcester	80,769	37,652	118,421
Fall River	54,821	50,942	104,863
Lowell	53,995	40,978	94,973
Cambridge	61,420	30,456	91,886
Lynn	59,771	17,742	68,513
Lawrence	33,982	28,577	62,559
New Bedford	36,913	25,529	62,442
Springfield	47,079	14,381	62,059
Somerville	44,411	17,232	61,643

Boston, the capital, is the chief city of the Commonwealth and ranks fifth among the great cities of the Union. Identified with the growth of the State from its beginning its historical landmarks are of profound interest to the visitor, and the traditions of the city, its development in modern times, its unrivaled suburbs distinguished by large numbers of tasteful and well-kept residences, its beautiful parks, public buildings, and points of literary and artistic interest, give it an important and in many respects a unique place among American cities. Other cities closely connected with the early history of the Commonwealth are Salem and Newburyport, located on the eastern coast in Essex County. Cambridge, near Boston, with which it is connected by several bridges spanning the Charles River, is the seat of Harvard Univer-

sity, and the former home of Longfellow and Lowell. Lowell and Lawrence upon the Merrimac, Fall River and New Bedford in Bristol County, and Holyoke in Hampden County, are all extensively engaged in textile manufacturing, Holyoke also, with Springfield, is especially interested in the production of paper of all grades. New Bedford was formerly the seat of the whaling industry now almost entirely abandoned. Lynn and Haverhill in Essex County and Brockton in Plymouth, are the centres of the boot and shoe industry. Worcester, the second city in point of size, well located near the centre of the State, is an educational centre as well, the seat of Clarke University and Holy Cross College, and is largely interested in high-class metal industries, and the manufacture of machinery. Waltham, in Middlesex County, is the site of a large watch-making establishment and has extensive textile factories. Northampton, in Hampshire, is the seat of Smith College for women. Woburn, in Middlesex, has large establishments for the production of leather. Gloucester, a seaport upon Cape Ann, is largely engaged in the fisheries. Quincy, in Norfolk County near Boston, has noted granite quarries. Fitchburg in Worcester County, Taunton in Bristol, North Adams and Pittsfield in Berkshire, Chicopee in Hampden, Beverly in Essex, and Marlborough in Middlesex, are all thriving cities with important industries; and Chelsea in Suffolk County, Everett, Somerville, Newton, Melrose, Medford, and Malden in Middlesex, are rapidly growing municipalities, largely residential, and closely connected with Boston within the metropolitan district.

Religion.—Originally, as elsewhere stated, Orthodox Congregationalism was the form of Church polity recognized by law. To-day all the principal denominations are represented. In respect to population, the Roman Catholics lead all others, more than 900,000 persons in the Commonwealth being of that faith. In church membership, the Orthodox Congregationalists rank next to the Roman Catholics, with approximately 115,000 members; followed by the Baptists (of whom there are several different bodies), with about 70,000; the Methodists (of different bodies), with about 60,000; the Unitarians, about 35,000; the Protestant Episcopalians, 30,000; and many other lesser bodies, of whom few, if any, exceed the limit of 10,000 in membership. In the value of church property, although recent exact statistics are not available, and conclusions must therefore be based upon estimates, the rank of the several denominations is the same except that the Roman Catholics change place with the Orthodox Congregationalists.

Government.—Originally based upon church membership, the conditions surrounding the suffrage have been subject to successive modifications. Dissenters from the Established Church were released from paying taxes for church purposes in 1815, and in 1833 all denominations were given equal standing before the law. Since the adoption of the original State constitution (1780) it has been twice revised by constitutional conventions held in 1820 and 1853. Numerous amendments to the original articles have been made, and new articles adopted from time to time. All male persons, 21 years of age and upward, able to read and write in the English language, and neither paupers, imbecile, or con-

MASSACHUSETTS

victs are entitled to vote. The State legislature, called the General Court, consists of the Senate, 40 members, and the House of Representatives, 240 members, elected for annual terms in Senatorial and Representative districts, respectively. Annual sessions are held beginning on the first Wednesday of January and continuing until prorogation after the completion of the business of the session.

The executive branch of the State government consists of a governor, lieutenant-governor, eight councillors who are the governor's constitutional advisers in the matter of appointments and other minor executive duties, and who are chosen in councillor districts, a secretary of the commonwealth, treasurer and receiver-general, auditor of accounts, and attorney-general. These officers are all chosen in a general election annually for annual terms. The governor is by virtue of his office commander-in-chief of the military forces of the State. He has a constitutional power of veto over the acts passed by the legislature, but, notwithstanding this, vetoed bills may be passed over the veto by a two thirds vote of both branches. Important executive functions are exercised by commissions of from one to three or more members, appointed by the governor, including among others the board of agriculture, the board of education, the commissioner of insurance, railroad commissioners, harbor and land commissioners, prison commissioners, the boards of health, lunacy, and charity, the board of conciliation and arbitration (dealing with labor disputes), the chief of the bureau of statistics of labor (controlling the census, social, and industrial statistics), etc. All judges are appointed by the governor and hold office during good behavior. The judicial system comprises police, district, and municipal courts, having original jurisdiction in minor civil and criminal cases, sometimes exclusive of the Superior Court and sometimes concurrent therewith; a Superior Court with original jurisdiction in higher cases, and original and concurrent jurisdiction with the Supreme Judicial Court; and a Supreme Judicial Court, which has general supervision over all courts of inferior jurisdiction, hears appeals, decides questions of law, etc. This court has also original jurisdiction in certain cases, and original and concurrent jurisdiction with the Superior Court in others. The Superior and Supreme Judicial Courts hold regular term sittings in the several counties. The judicial system also includes courts of probate and insolvency in each county, and there are trial justices, and justices of the peace, with limited jurisdiction.

Cities are incorporated by special legislative charter, the minimum population required being 12,000. City governments are administered by a mayor and city council. Towns are independent municipal bodies other than cities, the chief executive officers being the board of selectmen, elected in town meeting by those entitled to vote. The town meetings also make appropriations and decide, by vote, other important matters relating to the affairs of the towns.

The cities and towns are grouped into counties, 14 in number, namely, Barnstable, Berkshire, Bristol, Dukes, Essex, Franklin, Hampden, Hampshire, Middlesex, Nantucket, Norfolk, Plymouth, Suffolk, and Worcester. The

chief executive officers in the counties are county commissioners, elected annually.

Militia.—All able-bodied male citizens between the ages of 18 and 45 are in emergency liable to perform military duty. The present State militia force allowed by law consists of 484 officers and 6,115 enlisted men. These are organized in two brigades, the first consisting of one regiment of heavy artillery, one battalion of light artillery, one company of cavalry, two regiments of infantry, and a signal corps; and the second includes a battery of light artillery, a battalion of cavalry, three regiments of infantry, and a signal corps. There are also two corps of cadets, an ambulance corps, and a naval brigade.

Wealth, Debt, and Taxation.—Massachusetts is one of the wealthiest States of the Union. Much of the capital of its citizens is invested in enterprises out of the State. The value of real estate as fixed by the assessors of the various cities and towns for purposes of taxation was, at the date of the latest published return, \$2,434,898,295. The total personal estate returned from the same sources was \$680,527,992, but, with other legitimate additions, has been estimated at \$1,673,442,218, bringing the aggregate to \$4,108,340,513, and even this is probably an under-estimate. The debt of the State, less the amount of sinking fund applicable to its reduction, contracted for State purposes only, namely, loans for the construction of hospitals and other public buildings, the abolition of railway grade crossings, unpaid remainders of war debt, etc., amounts to \$13,472,628; but the Commonwealth is carrying temporarily an indirect indebtedness which, less sinking fund accumulation, amounts to \$52,491,378, this representing loans contracted for the benefit of certain municipalities and metropolitan districts, within which the credit of the State is pledged to aid the development of parks, water systems, sewerage construction, and armory construction, the communities benefited being assessed annually for the payment of interest and finally for the payment of the principal. The net debt of the State, direct and indirect, is thus \$65,964,006, although, as will be seen, the larger part of this is in point of fact municipal indebtedness authorized by the State legislature.

The aggregate tax levy for State, county, and municipal purposes, for the year covered by the latest report, amounts to \$50,827,713. Of this, \$1,608,217 is a poll tax assessed under a provision of law requiring the payment of such a tax, limited to \$2 per capita, by every male inhabitant of the Commonwealth above the age of 20 years, whether a citizen of the United States or an alien. The rate of local taxation in the different cities and towns, per thousand dollars of valuation, real and personal, varies from \$26 to \$5.50; rates from \$5.80 to \$9.80 being assessed in 13 towns; \$10 to \$14.90 in two cities and 119 towns; \$15 to \$19.80 in 30 cities and 143 towns; and \$20 to \$25 in one city and 43 towns. Under the tax system of the State, real estate is taxed to the owner wherever residing, the tax being payable in the city or town where the estate is located. Personal property taxes are payable in the town where the holder resides. Corporations are subject to a tax upon their capital stock, assessed and payable through the office of the State Commissioner of Taxation, the proceeds being distributed to the municipalities wherein the stock-

MASSACHUSETTS

holders reside, in proportion to the amount of shares held by them respectively. Shares in such corporations are therefore exempted from local taxation. Real estate and personal property in general is, on the other hand, subject entirely to local assessment, and, theoretically, at its full value. Incomes in excess of \$2,000 are taxable. Property held solely for religious, charitable, or educational purposes, is exempt from taxation.

Banks.—The latest published returns of the comptroller of the currency covering the year 1902 report the number of national banks in the State as 241; of these 34 are in Boston. The aggregate capitalization of the national banks is \$73,187,000; the circulation, \$21,883,000; the loans, \$285,841,000; deposits, \$231,856,000; the total assets being \$468,791,000.

Loan and trust companies number 36, the capital stock aggregating \$13,225,000; the surplus fund, \$11,120,000; undivided profits, \$4,078,068; deposits, \$127,928,218; and the total resources \$159,926,206. On 30 June 1902 the aggregate resources of all banks, including national and savings banks and trust companies, amounted to \$1,222,133,895, or an average per capita upon the estimated population of \$417.82; the per capita average being by classes as follows: National banks, \$159.35; loan and trust companies, \$54.67; savings banks, \$203.80.

The banks for savings are governed by a carefully guarded statute, and these institutions as well as co-operative banks (co-operative savings and loan associations) and trust companies are under the supervision of the state commissioners of savings banks. The savings banks, at the close of the year covered by the latest published return, numbered 186, the number of deposit accounts being 1,660,814; amount of deposits, \$586,937,084, the increase over the previous year being more than \$26,000,000. The average amount to each account was \$353.40, the deposits amounting, on the average, to \$192.63 to each person of the population. The savings banks throughout the State have been managed conservatively and very few losses have occurred; but the expense of management is remarkably low, the percentage of expense to total management being but .00234. The co-operative savings banks, which are really building associations, receiving deposits from their members in regular monthly payments, accumulating interest thereon, and loaning the amounts received to members only, principally upon first mortgages on real estate, have been uniformly successful and now number 130, the assets aggregating \$30,391,665. The Massachusetts statute governing these institutions is a model in legislation of this kind, carefully protecting the interests of the members, who, by the method of regular savings inherent in the system, are gradually accumulating considerable sums in cash, or acquiring home ownership.

In their relation to commerce, the financial interests of the State are largely centred in Boston. The first bank in this city, one of the earliest institutions of the kind in the country, was established in 1784 and still continues. Banking operations here have generally been conducted with conservatism and prudence. Since 1898 the aggregate banking capital invested in the city has been much reduced, and weak banks eliminated or strengthened by consolidation. The clearing-house exchanges for

the year covered by the latest returns amount to \$6,912,674,641.

Education.—From the earliest years the education of the people has been a vital subject of public concern. Harvard College at Cambridge was founded in 1636, and as early as 1647 it was provided in the colonial laws "to the end that learning may not be buried in the graves of our forefathers" . . . "that every township after the Lord hath increased them to the number of fifty households, shall appoint one to teach all children to write and read; and when any town shall increase to the number of one hundred families, they shall set up a grammar school, the master thereof to be able to instruct youth so far as they may be fitted for the University; provided that if any town neglect the performance hereof above one year, that every such town shall pay five pounds to the next school, till they shall perform the order." The spirit of this early law still continues. It has always been the policy of the Commonwealth to preserve the principle of local control of the schools, thus promoting the direct interest of the taxpayers in the several municipalities. Hence while the State law provides under penalty that schools shall be maintained in every city and town, these are administered by local boards termed school committees, elected by the people and clothed with broad general authority. Women, as well as male voters, may vote for the election of these officers. The State Board of Education, appointed by the governor, has advisory powers, intended to foster and promote the highest efficiency of the public schools, but no direct control of local schools, except in certain matters of general concern, such as the distribution of the income of the State school fund in aid of the schools in the poorer towns. This board through its agents exercises limited supervisory authority wherever aid is thus furnished. The board also directly administers the State normal schools established for training teachers. Such schools exist at Framingham, Westfield, Bridgewater, Salem, Worcester, Fitchburg, North Adams, Hyannis, and Lowell, besides a State Normal Art School at Boston, expressly devoted to the training of teachers in drawing and the arts of design. The buildings provided by the State for normal instruction are of the highest character, of modern construction, and all full equipped. The number of pupils in attendance approximates 1,700, and of 13,905 teachers employed in the public schools during the year covered by the latest published return, 6,498, or 46 per cent, had received normal instruction.

School attendance is compulsory between the ages of 7 and 14, and public schools must be maintained at least 32 weeks in every year, except that in towns under the valuation of \$200,000 the time may, by consent of the board of education, be reduced to 28 weeks. Cities and towns containing 500 families must maintain high schools as well as those of lower grade. Towns not subject to this requirement must pay for the tuition of their children who attend the high school of some other municipality, but sums so paid are reimbursed by the State to towns whose valuation does not exceed \$500,000. Cities and towns containing 20,000 inhabitants or more must maintain manual training in their schools. Towns may establish industrial schools, and any town may, and if of 10,000 inhabitants or

MASSACHUSETTS

more must, maintain annually evening schools for the instruction of persons over 14 years of age in elementary branches, and evening high schools must be maintained in cities of 50,000 or more inhabitants. The education of the children is further promoted by stringent provisions of law prohibiting under any circumstances the employment for wages of any child under 14 during the hours when the public schools are in session, and, unless certain educational requirements are met, of those under 16, in factories, workshops, or mercantile establishments. The number of children attending the public schools during the year covered by the latest published returns, was 474,234; the average membership, 415,533, and the average attendance 380,026, or 92 per cent of the average membership. At the same time there were 341,334 children in the State between the ages of 7 and 14. Of these, 299,065 were enrolled in the public schools, and the enrolment in private schools was 87,337. Evidently the law requiring school attendance is well enforced.

The total annual expenditure for public school purposes for the same year was \$15,132,133, of which \$3,442,063 was for school buildings. Of the whole amount 97 per cent was derived from local taxation. The average cost to the towns in taxation was \$27.10 for the school support of each child in the average membership, requiring an expenditure of \$3.70 for each \$1,000 of the State's valuation, or about 23 per cent of the average tax for all municipal purposes. The effective ventilation of school buildings is required under definite provisions of law enforced by the State inspector of factories and public buildings, and in the larger towns and cities these buildings are generally of the highest types of such edifices in this and in all other respects, large numbers having been erected within recent years. Under a law which went into effect 1 July 1902, every city and town must employ a superintendent of schools. Towns under a valuation of \$2,500,000 each must effect unions, under specified conditions for this purpose. The minimum salary of the superintendent within such a union is fixed at \$1,500, of which the State pays half.

The higher educational institutions within the State include the following: Harvard College (q.v.) at Cambridge, founded 1636; Williams College (q.v.) at Williamstown, 1793; Amherst College (q.v.) at Amherst, 1825; Mount Holyoke College (q.v.), for women, at South Hadley, 1837; College of the Holy Cross at Worcester, 1843; Tufts College (q.v.) at Medford, 1850; Massachusetts Institute of Technology at Boston, 1861; Boston College at Boston, 1863; Massachusetts Agricultural College at Amherst, 1863; Worcester Polytechnic Institute at Worcester, 1865; Boston University at Boston, 1869; Wellesley College (q.v.), for women, at Wellesley, 1870; Smith College (q.v.), for women, at Northampton, 1871; Clark University at Worcester, 1887; and Simmons College at Boston, 1902. Radcliffe College at Cambridge, having certain affiliations with Harvard but no legal connection with it, is devoted to the collegiate education of women, and there are also many seminaries and private schools of various grades in the State.

Libraries.—Free public libraries form an important element in the educational equipment of the State. These institutions, free to all the

citizens in the various cities and towns, are practically universal, only a fractional percentage of the population being without such privileges. The establishment of such libraries has in recent years been fostered by grants of money from the State treasury, and by the creation of a Free Public Library Commission, appointed by the governor, established to promote public library usefulness and to aid in founding such institutions where not then existing. This commission makes annual reports to the legislature upon matters within its jurisdiction. There are also numerous circulating and association libraries, not free to the public. The latest returns from all classes of libraries within the State, both secular and religious, show 2,028 libraries, containing 7,367,764 volumes, valued at \$9,873,700, and having a circulation for home use of 8,461,276 volumes. These figures, however, are from the State census of 1895 and are undoubtedly much below the present totals. The Boston Public Library, housed in a building which is one of the most noteworthy architectural monuments in the United States, is the largest free public circulating library in the country, and contains nearly 900,000 volumes; the Harvard University library has more than 500,000; the Boston Athenæum, 210,000; and the public libraries at Springfield, and Worcester, the State Library in the State House at Boston, and that of the American Antiquarian Society at Worcester, each exceed 10,000 volumes. (See *LIBRARIES.*)

Charitable and Penal Institutions.—The State institutions dealing with the defective classes include hospitals for the insane at Worcester, Taunton, Northampton, Danvers, and Westborough, and the Insane Asylum, so-called, at Medfield. The government of these institutions is in each case vested in a board of seven trustees, of whom five must be men and two women, one to be appointed annually by the governor and council, the place of the senior member being vacated each year. The Massachusetts Hospital for Epileptics at Foxborough is also controlled by seven trustees appointed in the same manner. By a law enacted in 1900 provision is made for a State Colony of the Insane, managed by a similar board of seven trustees. The Massachusetts School for the Feeble-minded at Waltham is governed by six trustees appointed by the governor for three-year terms. The Hospital Cottages for Children at Baldwinville has five trustees; the Massachusetts Hospital for Dipsomaniacs and Inebriates at Foxborough, five trustees; the Massachusetts Charitable Eye and Ear Infirmary at Boston, two trustees on behalf of the State; the Massachusetts General Hospital, four trustees on behalf of the State; the Massachusetts Homœopathic Hospital at Boston, five trustees on behalf of the State; the Massachusetts State Sanatorium at Rutland (for consumptives), five trustees; all these trustees being appointed for fixed terms by the governor. The Perkins Institution and Massachusetts School for the Blind at South Boston, has four trustees on behalf of the State, similarly appointed; and the Soldiers' Home at Chelsea, three. There are special educational institutions for the deaf in which the State is interested and to which educable children of this class may be sent, in accordance with the policy of the Commonwealth which makes schooling free for all its

MASSACHUSETTS

children even when physical defects of this nature forbid their attendance upon the public day school. These comprise the American School for the Deaf at Hartford, Conn.; the Clarke School for the Deaf, Northampton; the Horace Mann School for the Deaf, Boston; the Sarah Fuller Home for Little Deaf Children, Medford; the New England Industrial School for Deaf Mutes, Beverly; and the Boston School for the Deaf.

The penal and reformatory institutions include the Lyman School for Boys at Westborough; the State Industrial School for Girls at Lancaster, both controlled by trustees appointed by the governor; the State Prison at Boston (Charlestown District); the Massachusetts Reformatory at Concord; and the Reformatory Prison for Women at Sherborn, all controlled by the State Board of Prison Commissioners.

The State institutions for paupers include the State Hospital at Tewksbury and the State Farm at Bridgewater.

The local poor, having settlements under the law in the cities and towns, are cared for in local almshouses maintained by the municipalities. There are jails, houses of correction, and truant schools in the counties. The charitable institutions established and maintained by religious bodies or other private agencies are widely distributed; and, especially, hospitals for the treatment of accidents and disease, and homes for the aged have, in recent years, been numerously established throughout the Commonwealth.

By the latest published returns, covering the year 1902, the total number of paupers of all classes is 13,684, including 4,140 State poor, 5,044 city and town poor in local almshouses, and 4,500 pauper insane. The total cost of pauper maintenance for the year was \$3,743,134, or \$1.266 to each inhabitant of the State. For the same year the whole number of insane persons in the State was 9,386, distributed as follows: in public institutions, 8,271; in private institutions, 265; boarded out, 124; under the charge of overseers of the poor in local almshouses and private families, 726. (See PAUPERISM.)

The total prison population 30 Sept. 1902 aggregated 6,336; of whom 3,593 were confined in county jails and houses of correction, and 2,743 in the State prisons.

Vital Statistics.—Upon the estimated population of the State, the birth rate per 1,000 of persons living, for the year 1901, the latest for which complete figures are available, was 25.07; the marriage rate 8.67; and the death rate 16.82, the excess of births over death per 1,000 of persons living being 8.26. The death rate is slightly higher in the cities than in the towns. The total number of deaths for the year was 48,275, the number under each of the principal classified causes being as follows: from general diseases, 13,930; diseases of the nervous system and organs of special sense, 6,517; of the circulatory apparatus, 4,801; of the respiratory apparatus, 6,876; and of the digestive apparatus, 5,438.

Manufactures.—The State is largely devoted to manufacturing, the energies of its people having been early turned in this direction, and developed by more than a century of industrial training. No special advantages exist based upon the possession of raw material, or due to

natural resources, except water power, which, although changes in the methods of developing power render this less essential than formerly, is still an important factor. The climate of the southeastern part of the State is especially favorable to cotton spinning. In colonial days much was done to foster manufactures, invention has been promoted, and improved craftsmanship stimulated, and the effect has been significant throughout the industrial history of the State. The power loom, first constructed by Francis C. Lowell of Boston and Paul Moody of Amesbury, and put in operation at Waltham in 1814, revolutionized the cotton industry in the United States. The first cotton mill in the country was built at Beverly in 1788. As early as 1815 there were 57 cotton mills in the State with 46,650 spindles. The first attempt at woolen goods manufacture was at Rowley, in Essex County, in 1643, followed by more or less successful efforts in the same direction elsewhere in the State in the 17th and 18th centuries. The industrial history of Lowell, Lawrence, and Fall River is, in effect, the history of the growth of the factory system as applied to textiles in America. The boot and shoe industry developed from crude hand process of early times to the perfected factory operations of to-day, is interwoven with the story of the growth of Lynn, Haverhill, Brockton, and many smaller municipalities. The first printing done in the American colonies was at Cambridge in 1639; and from this small beginning onward the printing and publishing business has been important in the State. Much of the history of paper-making in the United States is the history of the industry in Massachusetts. The manufacture of india rubber goods in this country originated at Roxbury, now part of Boston, in 1833. Manufactures of metal, machinery of all kinds, wooden goods, jewelry, clothing, cordage, rattan and other furniture, have always been important.

In textiles, the most important industrial group shown in this table, the cotton industry leads with a product value of \$111,125,175. The spindles employed in this industry number 7,784,687, increasing 1,960,169, or 33.7 per cent, since 1890, being 40.6 per cent of the total increase in the country. In 1900 Massachusetts had 41 per cent of all spindles and 39.8 per cent of all looms employed in the cotton factories of the United States, and was first in rank among the States in the manufacture of cotton goods. The State led all others in the manufacture of worsted goods, the annual product reaching \$40,557,363; and in woolen goods, the product being \$30,888,104. It also holds first place in the boot and shoe industry, the figures being shown in the table. It has long been first in the manufacture of fine writing papers, the value of this product in 1900 being \$11,208,628, or 71.1 per cent of the total produced in the United States. The paper used by the national government for currency and bonds is produced within the borders of Pittsfield but near the Dalton line in a mill especially devoted to its manufacture. In the production of rubber boots and shoes the State ranks first, and in the manufacture of jewelry is preceded only by Rhode Island and New York. The labor employed in the factories of the State is highly skilled, its operations well organized, and its productive capacity correspondingly high. Labor difficul-

MASSACHUSETTS

ties have not been numerous nor protracted. The factory legislation, as a whole, is in advance of other States, and is well enforced, being supported by an effective public opinion. The laws against the employment of children are especially stringent, and such employment is reduced to small proportions. There exists an efficient State factory inspection department, with headquarters in the State House, and a corps of district inspectors covering all parts of the Commonwealth.

The following table shows the returns, according to the census of 1900, of all industries in the aggregate and of the principal industries in detail:

and poultry valued at \$1,018,119. The total value of domestic animals on farms was \$14,730,169. The number of persons engaged in agriculture, not including lumbermen and wood-choppers, was 65,692, those classed as agricultural laborers numbering 31,515. The farms operated by owners constituted 90.7 per cent of the whole number, only 9.3 per cent being carried on by tenant farmers. Of the families residing on farms, 84.9 per cent resided on owned farms. The amount expended during the year for farm labor aggregated \$7,487,280. The farms classified upon the basis of the principal source of income are as follows: Hay and grain, 3,284; vegetables, 3,117; fruits, 1,286;

INDUSTRIES	Number of Establishments.	Capital	Wage Earners		Value of Product
			Average Number	Total Wages	
All industries.....	31,982	\$840,281,127	499,746	\$229,343,215	\$1,038,196,393

Agriculture.—The agriculture of the State, as compared with that of the great farming States of the West, is not important. The industry has always been secondary to manufacturing. Following the lines of least resistance, it has turned chiefly to the production of milk, eggs, poultry, and such vegetables as find a ready market in the growing factory towns and cities almost at the farmer's door. Considered from this standpoint and measured by the value of the product annually sold, no decline is shown in recent as compared with earlier years. For example, the total value of product for the year covered by the United States census of 1900 was \$42,298,274, as against \$28,072,900 returned 10 years previously. The returns in the State census are more favorable than those secured in the national enumeration, since taken in the autumn and possibly with greater care; but inasmuch as comparisons with other States can only be made by using the national figures, they will be relied on here. The total number of farms returned is 37,715; and the total acreage 3,147,064, of which 1,292,132 is improved. The farm property is valued as follows: Land and improvements, except buildings, \$86,925,410; buildings, \$71,093,880; implements and machinery, \$8,828,950; live stock, \$15,798,464. The animals upon the farms in the State, 1 June 1900, included 285,944 neat cattle; 75,034 horses; 18,690 lambs (under 1 year); 33,869 sheep (1 year and over); 78,925 swine;

live stock, 8,193; dairy produce, 14,900; tobacco, 632; flowers and plants, 597; nursery products, 49; miscellaneous, 5,657. The State ranks seventh among the States with respect to the number of farms which derive their principal income from dairy produce. The total dairy product for the year amounted to \$12,855,744, the amount sold being \$11,468,784, the remainder being consumed on the farms. The value of milk sold was \$9,711,380; cream, \$870,833; butter, \$884,575; and of cheese, \$1,990. The total value of poultry raised during the year was \$1,407,681; and the egg product aggregated 12,928,630 dozen. Only 53,385 acres were devoted to cereals, the product for the year being valued at but \$922,127, or only 4.3 per cent of the total crop value. Of the principal cereals the acreage and bushels produced are as follows: Corn, 39,131 acres, 1,539,980 bushels; oats, 6,702 acres, 240,990 bushels; rye, 4,557 acres, 60,294 bushels; barley, 638 acres, 14,987 bushels; buckwheat, 2,262 acres, 36,034 bushels; wheat, 95 acres, 1,750 bushels. The acreage devoted to hay and forage crops, exclusive of cornstalks, was 610,023, and the tons produced, 848,950. Certain sections of the State are devoted to special products of considerable importance. Among these are tobacco raised in the Connecticut Valley, cranberries in Barnstable County, and general market produce in parts of Middlesex County near Boston.

The Fisheries.—The fishing industry has,

MASSACHUSETTS

from the earliest years, been an important element in the prosperity of the coast towns and the hardy seamen of Gloucester and Marblehead, engaged in this industry in times of peace, have won renown in the naval operations of the country in times of war. The latest complete returns relating to the fisheries of the State show a working capital invested, including apparatus and supplies, of \$5,338,828, and the following annual product: Food fish, \$4,647,914; fish products, \$122,327; food fish products, \$9,923; shell fish, \$546,351; whale and seal products, \$351,613; other products, \$25,015; aggregating \$5,703,143. The total number of fishermen is returned as 11,093, including officers and crew. Of the investment, 60.84 per cent, and of the product, 56.34 per cent, is credited to the city of Gloucester; New Bedford having 10.24 per cent of the investment and 5.49 per cent of the product; Provincetown, 6.17 per cent of the investment and 7.62 per cent of the product; Boston, 5.43 per cent of the investment and 8.92 per cent of the product; and the remainder being distributed among a number of other cities and towns.

Commerce.—By the latest statistics, the investments in coastwise and ocean commerce under the American flag include in an aggregate of \$14,394,432, the following details: Buildings and fixtures, \$313,235; cash capital, \$1,150,870; credit capital, \$94,040; land, \$352,414; vessels, including outfit, \$12,220,132; and wharves, \$263,741. These figures are undoubtedly below the actual, owing to deficiencies in the returns, and to the natural increase since they were secured. The same statement applies to earnings which are returned as follows: From freight, \$7,253,503; from passengers, \$2,085,818; aggregating \$9,339,321.

Boston, of course, is the chief port of entry, and in the aggregate value of investments and earnings derived from ocean commerce exceeds all others. The city is extensively engaged in European commerce, much of which is conducted under foreign flags. Lines of passenger and freight steamers regularly ply between Boston and European ports, and the coastwise passenger and freight traffic to the east and south is important. For the year covered by the previous returns, the commerce, under foreign flags, credited to Boston, included 61 vessels, the aggregate investment being \$14,464,000; and the earnings from freight, \$4,775,985; from passengers, \$1,238,089; in the aggregate, \$6,014,074.

Railroads.—Transportation facilities have kept pace with the industrial development of the State. Boston, the metropolis, is connected with the West by two railway systems, and these communicate either directly or by branches with all the leading industrial centres. One general system, with its various divisions, communicates with the South by way of New York, uniting important manufacturing cities and towns, while a network of main and branch lines connects the northern and eastern factory centres of the State with each other, with the seaboard, and with the railway systems leading south and west. There are in the State 2,107 miles of main and branch railroad line, besides 939 miles of second, third, and fourth main track, and 1,391 miles of side track, making the total length of railroad track within the State 4,437 miles. Ten companies in all are operating, but three of these,

the Boston and Albany (New York Central and Hudson River, lessee), Boston and Maine, and the New York, New Haven and Hartford, operate over 96 per cent of the railroad mileage, and conduct nearly 98 per cent of the entire passenger and freight traffic. The gross assets of the companies, 30 June 1902, aggregated \$418,298,274, and the gross liabilities, \$383,106,669. The total income for the year aggregated \$99,375,022, and the total expenditures \$98,757,945, including dividend payments. Electric street railways have multiplied during the last 10 years, and they now connect all of the principal cities and towns. In the city of Boston subway and elevated railway construction of the highest class, completed and in process, has already transformed the methods of street transit, and will finally solve the problem of rapid communication between different parts of the city and its suburbs. The Massachusetts street railway companies now own, according to the latest published returns, 2,111 miles of main track, 333 miles of second main track, and 147 miles of side track, these aggregating 2,591 miles. The gross assets of these companies aggregate \$123,200,558, and the gross liabilities, \$119,441,792. The total income for the year amounted to \$24,918,161, and the total expenditures to \$24,668,021.

Bibliography.—*Historical:* Hutchinson, 'History of Massachusetts' (1764-7); Barry, 'History of Massachusetts' (1855-7); Savage, 'Winthrop's History of New England' (1825-6); Young, 'Chronicles of the Pilgrim Fathers' (1841), and 'Chronicles of Massachusetts' (1846); Schouler, 'Massachusetts in the Civil War' (1868-71); Drake, 'The French and Indian War' (1870); Adams, 'The Emancipation of Massachusetts' (1887); Goodwin, 'The Pilgrim Republic' (1888); Ellis, 'The Puritan Age and Rule in the Colony of the Massachusetts Bay' (1888); Fiske, 'The Beginnings of New England' (1889); Adams, 'Three Episodes of Massachusetts History' (1892); and 'Massachusetts: Its Historians and Its History,' (1893); Byington, 'The Puritan in England and New England' (1896); Howe, 'The Puritan Republic' (1899). There are numerous local, town, and county histories, among them, Holland, 'The History of Western Massachusetts' (1855), and Winsor, ed. 'The Memorial History of Boston' (1880). Among popular compendiums see Powell, 'Historic Towns of New England' (1901), and Bacon, 'Historic Pilgrimages in New England' (1898). The published collections of the Massachusetts Historical Society contain invaluable material, not otherwise readily accessible, relating to the early history of the Commonwealth. *Scientific:* Hitchcock, 'Report on the Geology, Mineralogy, Botany, and Zoology of Massachusetts' (1833); 'Final Report on the Geology of Massachusetts' (1841); 'Ichthyology of New England' (1858); and supplement to the same (1865). The following are official reports: 'Fishes, Reptiles and Birds of Massachusetts' (1839); 'Herbaceous Flowering Plants of Massachusetts' (1840); 'Invertebrata of Massachusetts' (1841); and Emerson, 'Trees and Shrubs of Massachusetts' (1875). *Public Documents:* The Census Reports of the United States; Reports of the Decennial State Census; Annual Reports on the Statistics of Manufactures and on the Statistics of Labor, Bulletins, etc.; issued by the State Bureau of Statistics of Labor; Annual Re-

Librarian, Boston Public Library.

Massachusetts Agricultural College, at Amherst, Mass., a coeducational institution, chartered in 1863 and opened in 1867 by the State. The college farm is 400 acres in extent, about 100 acres of which are devoted to horticulture, and 200 acres to farming. The work is experimental on the part of the students. The regular course extends over four years, but special courses are given for women desiring to study dairying, market gardening and some other subjects. Winter courses are provided for those unable to take the four years' work. The regular courses lead to the degrees B.S., M.S., and Ph.D. In 1903, the number of instructors was 24, and the students in attendance about 165. The library had about 24,000 volumes; the buildings and grounds were valued at \$265,000 and the equipment at \$115,000.

Massachusetts Bay, an arm of the Atlantic indenting the eastern shore of Massachusetts, and extending from Plymouth Harbor on the south to Cape Ann on the north, a distance of 42 miles. It is triangular in shape, the north and south shores inclining toward each other until at the entrance to Boston Harbor they are about five miles apart. The depth from the base of the triangle to Boston Harbor is about 21 miles. The northern shore is rocky and irregular, the southern low and sandy. The principal inlets are: on the north coast, Gloucester and Nahant bays and Salem, Marblehead and Lynn harbors, and on the west Boston Harbor. Along the shores are a number of capes and headlands, and off the coast a number of small islands. At the entrance to Boston Harbor there are several islands, on some of which are fortifications. Cape Cod Bay on the southeast is sometimes included in Massachusetts Bay.

Massachusetts Bay Colony. See MASSACHUSETTS, *History*.

Massachusetts Historical Society. See AMERICAN HISTORICAL SOCIETIES.

Massachusetts Institute of Technology, **The**, was founded in 1865, at the close of the Civil War, when the need was beginning to be felt for schools which should train men to deal with the new industrial problems. It was the plan of President Rogers, and of his co-workers, to establish a school which should give a thoroughly practical training in the application of scientific principles to practice in the arts, but not primarily training in mere technics, in the narrow sense. Accordingly they planned that each of its courses should embrace enough general studies to impart the elements, at least, of a liberal education; and, above all, they laid down that the most truly practical training, even in an industrial sense, must be grounded in a thorough knowledge of scientific laws.

Founded on these principles, the Institute of Technology began a career of steady development. To-day it is the largest school of its class in the United States, the widest in scope

of instruction, and in many respects the best equipped. The total number of its students, in 1902-3, was 1,608, the total number of instructors 183. The number of graduates in the class of 1902 was 193. Though 58 per cent of the students come from Massachusetts, among the remainder are found residents of 41 States of the Union, and of 18 foreign countries. In all 35 classes have graduated, aggregating over 2,700 persons. Except in seasons of financial depression, the demand for these graduates is always in excess of the supply.

The undergraduate studies of the school are divided into 13 distinct courses, each of four years' duration, and leading to the degree of Bachelor of Science. The four-year courses are Civil Engineering, Mechanical Engineering, Mining Engineering, Metallurgy, Architecture, Chemistry, Electrical Engineering, Biology, Physics, General Studies, Chemical Engineering, Sanitary Engineering, Geology, and Naval Architecture. Between the departments which maintain these several courses there is the closest connection and mutual support. Consequently, the instruction is specialized to a degree which would be impossible in a smaller college, with a less numerous staff of instructors. Again, the instructors, though connected in a special sense with one department, are giving instruction, it may be, to students from many others. This mutual helpfulness of the departments is seen first in the fundamental subjects, such as chemistry in the first year, and physics in the second, which are given to several courses or to all. It is seen again, in the large number of optional lines of work offered. Within most of the regular courses the student is allowed considerable latitude of choice, in the later years of his study, and may thus select that group of studies which is best adapted to the particular branch of his profession for which he is preparing.

The Institute occupies at present eight buildings devoted exclusively to instruction. The most interesting aspect of the equipment is the extensive laboratories. Many of them, when first instituted, represented an attempt to apply the laboratory method in a way up to that time unknown in the history of scientific instruction in this country. The laboratories of physics and of chemistry were the first to offer laboratory instruction in these subjects to students in large classes; and the mining and metallurgical laboratories, the steam laboratory, and the laboratory for testing the strength of materials also represent a marked advance over previous methods, either in the subjects taught or in the scale on which the work is done.

The extensive and highly specialized equipment of these laboratories cannot here be adequately described. In the 21 separate laboratories devoted to chemistry, for instance, there are, besides the larger general laboratories, smaller rooms for volumetric analysis, organic chemistry, air, water and food analysis, the analysis of oils and gases, the optical and the chemical examination of sugars and starches, and the determination of molecular weights. There are also the industrial chemical laboratories, which include a special laboratory for textile coloring, with printing machines, baths, dryers, and the like. The engineering laboratories, which provide facilities for practical work in steam engineering, hydraulics, cotton machin-

MASSAGE — MASSASOIT

ery, and the testing of materials, occupy a floor space of 21,380 square feet. The equipment of the steam laboratory, to speak of that alone, is exceptional, including a 150-horse-power, triple-expansion Corliss engine, the first of its kind of practical size ever arranged for experimental purposes; a second engine of 225 horse-power, transferring its power through a rope drive; a number of small engines for experiments and the study of valve-setting; gas engines, hot air engines, and other apparatus. The new Lowell Laboratory of Electrical Engineering covers an area of 45,000 square feet, and embraces a laboratory for electrical measurements, photometer rooms, and a main power and testing floor 300 feet in length by 40 feet in width. The new laboratory offers facilities for instruction and research which are unsurpassed in this country or abroad.

With this unusual laboratory equipment, it has been possible for the Institute to do much of its experimental work on a scale approaching that of industrial operations. The laboratories of mining and metallurgy, for instance, are designed to treat ores in quantities approximating those used in actual practice, and ranging from 500 pounds to 3 tons, and the contributions to the literature of ore-dressing and metallurgy from this laboratory are well known. In the laboratory for testing the strength of materials, again, were conducted the first systematic and extended tests of beams of commercial size.

Throughout all the work of the Institute the aim of instruction is so to adjust the theoretical and experimental work that the acquirement of principles in the class-room shall prepare the student for his laboratory exercises, and that these in turn shall fix methods and results in his memory, and give him capacity for new experimentation. Throughout it is intended to guide the student rather than to instruct him, and, whether in the four-year courses above described or in the graduate courses with which these may be supplemented, he is trained to work with less and less dependence upon his teachers. This training should result in a considerable increase in his power of ascertaining facts and overcoming difficulties, and so should increase his capacity for research.

N. I. TYLER.

Secretary Massachusetts Institute of Technology.

Massage, a procedure, usually performed by the hands, such as friction, kneading, rolling, and percussion of the external tissues of the body, either to relieve pain or to assist a cure, or with some hygienic object in view. A male massagist is known as a masseur, a female as a masseuse. Massage in some crude form has always been used by savages as well as by the civilized. It was one of the luxuries of the ancient Greeks and Romans, was largely used by gladiators, and to make slaves more comely by filling out their tissues. Sometimes it was done by medical practitioners, often by slaves and priests and those appointed to anoint the wrestlers before and after they exercised. Hippocrates, who employed rubbing to restore the free movement of blood and other fluids, says that "rubbing can bind and loosen, can make flesh, and cause parts to waste; hard rubbing binds; soft rubbing loosens; much rubbing

causes parts to waste; moderate rubbing makes them grow." Manual treatment of the body was long ago practised by the Chinese, and the Japanese, Turks, Egyptians, and people of various nationalities have employed it in some form from early times.

Often the use of massage is associated with that of certain active and passive movements known as the Swedish movement-cure (q.v.), established by Pehr Henrik Ling (q.v.). His system of gymnastics became popular in spite of opposition and of the fact that it was largely a revival of old methods of treatment. In 1873 Mezger, of Amsterdam, and in 1877 S. Weir Mitchell of Philadelphia, pushed forward the cause of massage. To-day it is considered by physicians as a branch of medical treatment, useful in certain cases if rightly administered, but capable of doing harm when improperly applied. Unfortunately the laity frequently look upon it as a sole means of relief or cure. The procedures in massage may be placed under four heads: stroking (the *effleurage* of the French), kneading (*malaxation*), friction, and percussion. Stroking is performed over surfaces with the palm of the hand or its radial border, or with the pulps of the fingers, or the sides of the knuckles. Kneading is the grasping of muscles, etc., with both hands or between the thumb and fingers of one hand, and rolling and squeezing them. Friction is a peculiar and forcible circular rubbing. Percussion is the striking or beating of a part, either with the hand or an instrument called a percussor or muscle-beater. It is claimed that the modern system of massage makes the blood circulate more freely, strengthens muscle-fibres, causes effusions and exudations to be absorbed, improves secretory and excretory action, and invigorates the whole system. It is frequently used with good results to stimulate assimilation and invigorate digestion, to soothe nervous irritability, relieve pain, and arouse nerve-force, to equalize the circulation, to remove morbid deposits from around joints, to restore mobility, and for the correction of obstinate constipation and other disordered conditions.

Massagetae, mā-sāj'ē-tē, in ancient history, a name given to nomadic tribes of northern Asia who dwelt to the east and south of the Caspian Sea. Herodotus says they worshipped and offered horses to the sun, had a community of wives, killed and ate their aged people, lived chiefly on the milk and flesh of their herds and on fish, and fought on foot and on horseback with lance, bow, and double-edged axe. They are chiefly mentioned in connection with Persian history. According to some they belonged to the Mongolian stock, according to others to the Aryan.

Massasoit, mās'a-soit, American Indian chief, sachem of the Wampanoags: b. Massachusetts 1580; d. 1661. His dominion extended over nearly all the southern part of Massachusetts, from Cape Cod to Narraganset Bay; but his tribe, once estimated at 30,000 in number, had shortly before the landing of the pilgrims at Plymouth been reduced by a disease, supposed to have been yellow fever, to barely 300. On 22 March 1621, a little more than three months after the founding of Plymouth, he appeared before the infant settlement with 60 of his warriors, armed and painted, for the purpose of forming

MASSASSAUGA — MASSEY

a friendly league with the white men. Although the tribe were reputed to be cruel and treacherous, the open and friendly greeting of Massasoit so favorably impressed Gov. Carver, that after the necessary formalities were concluded, he formed in behalf of the colony a treaty of peace and mutual protection with the Wampanoags, which for 50 years was sacredly kept by both parties. The friendly disposition of Massasoit toward the colonists never relaxed. He lived within the limits of what is now the town of Warren, R. I., near an abundant spring which yet bears his name, where he often entertained wandering pilgrims or administered to their necessities. Roger Williams, while on his way to Providence, was for several weeks his guest at this place. Massasoit was just, humane, and honest, never violating his word and constantly endeavoring to imbue his people with a love of peace. In person, Morton says, in his 'Memorial,' he was "a portly man in his best years, grave of countenance, spare of speech." His second son, Pometacom, called by the colonists King Philip, who ultimately became sachem of the Wampanoags, was of a less placable disposition, and allowed the encroachments of the colonists to hurry him into the bloody contest known as King Philip's war.

Massassauga, mäs-a-sä'ga, the ground rattlesnake of the central United States. See **RATTLESNAKE**.

Masséna, André, äñ-drä mä-sä-nä, marshal of France: b. Leven near Nice, France, 6 May 1758; d. 4 April 1817. In 1775 he entered the French army and after 14 years' service left the army and returned to Nice, where he married. During the Revolution he entered a battalion of volunteers, and in 1793 was made general of brigade. In 1794 he took command of the right wing of the French army in Italy, where, at Rivoli and elsewhere, he highly distinguished himself. In 1799 he defeated the Austrian and Russian forces at Zürich, and in 1800, by his defense of Genoa for three months, gave Bonaparte time to strike successfully at Marengo. In 1804 he was created marshal of the empire. In 1805 he received the chief command in Italy, where after the Peace of Presburg he occupied the kingdom of Naples. In 1807 he was given the command of the right wing of the French army in Poland, and soon after received the title of Duke of Rivoli. In 1809 he distinguished himself against the Austrians, and at Esslingen his constancy and firmness saved the French army from total destruction. Napoleon rewarded him with the dignity of Prince of Esslingen. In 1810 he took command of the army in Portugal, and forced Wellington within the lines of Torres Vedras, till want of provisions compelled Masséna to retire. In 1814 he was made a peer by Louis XVIII., and though on the return of the emperor he acknowledged his authority, took no active part in the events of the Hundred Days.

Massena, mä-sē'na, N. Y., village, in Saint Lawrence County; on the Grasse River, and on the New York C. & H. R. and the Grand T. R.R.'s; about 35 miles northeast of Ogdensburg. It was settled by people from Vermont, about 1802, and was incorporated as a village in 1886. It is situated in a rich agricultural region, in which the chief products are hay, potatoes, dairy products, and apples. Massena Springs, just outside the village limits, is one

with the village in commercial and industrial interests, and is a famous resort on account of its medicinal springs. Great opportunities for manufacturing are afforded by the plant of the Saint Lawrence River Power Company, which has a capacity of 40,000 horse-power, and which can easily be increased. This power has been secured by diverting a small portion of the waters of the Saint Lawrence River through a canal, three miles long, into turbines, which have direct connection with electric generators, and thence into the Grasse River.

The canal starts at the head of the Long Sault rapids in the Saint Lawrence, and is 200 feet wide and 18 feet in depth. Owing to the peculiar formation of the country here, the point at the head of the rapids is 45 feet higher than the point where the canal enters the Grasse River, which is a tributary of the Saint Lawrence. The Grasse acts as a tail race, carrying the water back into the Saint Lawrence. Two bridges span the canal. By using the Grasse River and the canal there is now a passage wholly within the United States for steamers around the unnavigable rapids. The power plant at Massena is second only to Niagara as a centralized power supply station. The chief industrial establishments are reduction works, which employ 300 men; veneering works, employing 100; mineral filler works, 30 employees; sash and door works, 20 employees. Other manufacturing are under consideration. There are seven churches, two banks, a high school, and public schools. Massena is the business centre for a population of 60,000. Pop. (1890) 1,049; (1900) 2,032; (1903) 3,000.

Massenet, Jules Frédéric Emile, zhül frä-dä-rèk ä-mèl mäs-nä, French composer: b. Montaud, near St. Etienne, France, 12 May 1842. He studied at the Paris Conservatoire, in which in 1878 he became professor of composition. His first important work was the opera 'Don César de Bazan' (1872), which was followed by 'Les Erinnyes' (1873); an oratorio 'Marie Madeleine' (1873); and an oratorio 'Eve' produced in 1875. Later works of his are: The opera 'Le Roi de Lahore'; the cantata 'Narcisse'; 'La Vierge' (1879); 'Hérodiade,' a religious opera (1881); 'Manon Lescaut,' an opera (1884); 'Le Cid' (1885); 'Esclarmonde' (1889); 'Werther' (1892); 'Thaïs' (1894); 'Sappho.' Massenet's earlier works, such as 'Marie Madeleine,' are still among his best. The promise contained in them has not been fulfilled in his later productions, in many of which genuine musical feeling is sacrificed to the tricks that secure popularity.

Massey, mas'ī, Gerald, English poet: b. near Tring, Hertfordshire, 29 May 1828. He received but little education, and at 8 was employed in a silk factory. Going to London about 1843, he worked as an errand boy, and six years later became editor of 'The Spirit of Freedom,' a Radical paper, becoming at the same time associated with Kingsley, Maurice, and other Christian Socialists. In 1854 he published 'Ballad of Babe Christabel,' and other poems. The volume attracted the notice of Landor, and the poems issued in succession to it met with no little popularity. Other books of his are: 'The Secret Drama of Shakspeare's Sonnets' (1864-72); 'A Tale of Eternity and other Poems' (1869); 'Concerning Spiritual-

MASSILLON — MASSOWAH

ism' (1872); 'A Book of the Beginnings' (1882); 'The Natural Genesis' (1883); 'My Lyrical Life,' a collection of poems (1889). For some years he lectured at home and in the United States and Australia on spiritualism and various social and socialistic subjects.

Massillon, Jean Baptiste, zhôn ba-têst mäsë-yôn, French preacher: b. Hyères, Provence, 24 June 1663; d. Clermont 18 Sept. 1742. In 1681 he entered the Congregation of the Oratory; then taught theology at Montbrison and Vienne; went to Paris in 1696 as director of the Seminary of St. Malo; and won great favor, even at court, by his eloquent and searching sermons. His funeral orations are particularly famous. In 1718 he was appointed preacher to Louis XV., then only 9 years old, and for him composed the 'Petite Carême,' a notable series of sermons. Massillon was elected to the French Academy in 1719; in the same year he retired from Paris to Clermont, where he died of apoplexy. His works were edited in 1886 by Blampignon, whose biographical sketch, 'Massillon d'après des Documents inédits' (1879), should be consulted.

Massillon, mäs'il-on, Ohio, city, in Stark County; on the Tuscarawas River, the Ohio Canal, and on the Wheeling & L. E., the Pennsylvania, and the Cleveland, L. & W. R.R.s; about 100 miles in direct line northeast of Columbus and 8 miles west of Canton. Massillon was established in 1825, and in 1853 was incorporated as a village; the city charter was granted in 1868.

It is situated in the Tuscarawas Valley, noted for its large bituminous coal fields and for its excellent farm lands. In the vicinity of the city are quarries of white sandstone. Some of the industrial establishments are foundries, rolling-mills, machine-shops, bridge works, potteries, glass-works, steel tubing, furnaces, flour-mills, and creameries. In addition to the manufactures of the city there is a large trade in coal, sandstone, grain, and live-stock. The State Hospital and Asylum for the Insane is in Massillon. The city has a number of fine buildings, chief among them are the churches and schools. The government is administered under the charter of 1868, its first charter, and is vested in a mayor, who holds office two years, and a council. The board of education is chosen by popular vote; the boards of health and equalization are elected by the council. Other administrative officials are appointed by the board subject to the approval of the council. Pop. (1890) 10,092; (1900) 11,944.

Massinger, mäs'in-jér, Philip, English dramatist: b. Salisbury 1583; d. Southwark, London, March 1640. He studied at St. Alban Hall, Oxford, went to London in 1606, and soon became a well-known playwright. He collaborated with Nathaniel Field, Thomas Dekker, Cyril Tourneur, and Robert Daborne, and regularly with Fletcher in 1613-25. Independently, he wrote 15 plays, including comedies, tragedies, and tragi-comedies. They are frequently based closely on Italian and Spanish originals, but show much skillfulness in the development of plot, and a knowledge of the requirements imposed by stage presentation. 'Henry VIII.' in its present form was probably written by him with Fletcher. Among the plays wholly by him are: 'The Bondman'

(1624); 'The Roman Actor' (1629); 'A New Way to Pay Old Debts' (1632); 'The Guardian' (1655). 'A New Way to Pay Old Debts' kept the stage in England to the end of the 19th century. There is an edition of his plays by Cunningham (1867); and of 'Selections' by Symon (1887-9). Consult Fleay, 'Biographical History of the English Drama.'

Masson, mäs'on, David, Scottish critic and biographer: b. Aberdeen 2 Dec. 1822. He was educated at Marischal College there and Edinburgh University, and was in 1852 appointed to succeed Clough in the chair of English language and literature at University College, London. He was editor of 'Macmillan's Magazine' 1859-68, and was professor of rhetoric and English literature in the University of Edinburgh 1865-95. He is best known for his elaborate and comprehensive study of Milton's life and times (six volumes, 1858-80)—a work valuable alike as a contribution to English history and to the history of English literature. Other works by him are: 'British Novelists and their Styles' (1859); 'Recent British Philosophy' (1865); 'Drummond of Hawthornden' (1873); 'The Three Devils—Luther's, Milton's, and Goethe's' (1874). He has also published the Cambridge edition of Milton's Poems with introductions, notes, and an essay on Milton's English (1877); 'De Quincey' in 'English Men of Letters' series (1878); an edition of De Quincey's works (14 vols 1889-91); and 'Edinburgh Sketches and Memories' (1892). In 1893 he was appointed Historiographer-Royal for Scotland.

Masson, Frédéric, frä-dä-rèk mäs-sôn, French historian: b. 1847. He was librarian in the archives of the foreign office, and after the overthrow of the Empire became secretary to Prince Napoleon, and was entrusted with the arrangement of the Prince's papers and collections. He is known as the author of nearly 20 volumes in a still incomplete series of works on Napoleon I. His method is anecdotic, and he has based his statements on original documents, — correspondence, account- and note-books, and the like, many of which he himself owns in his large collection of Napoleonic material. Among the titles of his studies are: 'Napoleon at Home'; 'Napoleon in Campaign'; 'War Adventures'; 'Napoleon's Cavaliers.' In 1903 he was elected to the Académie Française to succeed Gaston Paris.

Mas'sorah, mäs-sō'rä. See MASORA.

Massowah, mäs-sow'ä, or **Massawa**, north-east Africa, a seaport and the principal town of the Italian colony of Eritrea, on a small coral island in the Red Sea, at the northern end of Arkeeko Bay, connected with the mainland by a causeway. The town is built of stone, is defended by several forts, and is supplied with water from the neighboring M'Kulu heights. The town is hot and unhealthy, but the M'Kulu hills have a much better climate. A railway 17 miles long connects with Saati inland. The chief imports are grain and flour, cotton manufactures, glass-ware, arms, cutlery, spices, wines, and spirits; principal exports, rhinoceros-horns, gold, ivory, honey, pearls, gums, skins, and wax, brought by caravans from the interior. Formerly dependent on Egypt, the town and strip of coast were ceded to Italy in

1885. Pop. (1899) 7,775, including 600 Europeans and 480 Asiatics.

Massys, mäs-sis'. See MATSYS, QUENTIN.

Mas'taba, an Arabic word meaning bench, applied to certain Egyptian tombs which were common under the Memphite dynasties. Remains of hundreds of these tombs still exist. They are in size from 18 by 26 feet to 85 by 172 feet. They are oblong, bench-like structures, with flat roofs of stone slabs.

Master and Servant. See LAW OF FAMILY.

Master of Arts (M.A. or A.M., *artium magister*), an academical honor conferred by universities of the United States, Great Britain and other countries, upon students after a course of study and a previous examination in the chief branches of a liberal education, particularly philosophy, philology, mathematics, physics, and history. The word *magister*, connected with a qualifying phrase, was used among the Romans as a title of honor; but its present meaning must be traced to the time of the establishment of the oldest universities. Regularly organized faculties were not then known as they now exist in the universities. The whole circle of academic activity was limited to the seven liberal arts (see ART); and they who received public honors on the completion of their course of studies, for their diligence and knowledge, and had already received the degree of *baccalaureus* (bachelor), were called *magistri artium* (masters of the liberal arts). In American and English universities this degree follows that of Bachelor. The degree of Master of Arts is inferior to that of Doctor of Letters (D. Litt.). In the German universities the title was formerly conferred, but has been superseded by that of Doctor of Philosophy (Ph.D.), which practically corresponds to the degree of M.A. in other universities. This title is an indispensable preliminary to the attainment of the position of *dozent* in the German universities, that is, one who has obtained the right to deliver academical lectures.

Master of Ballantrae, bäl-an-trä', *The*, a novel by Robert Louis Stevenson, published in 1889. It is a Scottish romance of the 18th century, beginning with the Stuart uprising of 1745. It is a sombre tragedy of the enmity of two brothers, of whom the elder, James Durrie the Master, takes the side of the Stuarts, the younger, Henry, that of King George.

Master Singers. See MEISTERSINGERS.

Mas'terwort, the rustic name of several umbelliferous plants, as those of the genus *Anethum* (see DILL), formerly much cultivated as pot-herbs, and held in great repute as a stomachic, sudorific, diuretic, etc. The edible root has a pungent taste, causes a flow of saliva and a sensation of warmth in the mouth, and often affords relief in toothache.

Mastic Gum, or **Mastiche**, a resinous substance flowing from deep incisions made in the branches of the *Pistachia lentiscus*, a shrub of the terebinth family growing in the countries bordering on the eastern Mediterranean. This tree attains the height of 15 or 20 feet; the leaves are alternate and pinnate; the flowers are small, inconspicuous, disposed in axillary racemes, and are succeeded by an ovoid drupe containing an osseous nut. It forms one of the most important products of Scio, and other

Ægean islands, where it has been cultivated from remote antiquity. Heat seems to exercise a great influence on the resinous product. Mastic is consumed as a chewing-gum in vast quantities throughout the Turkish empire by women of all classes, for the purpose of cleansing the teeth and imparting an agreeable odor to the breath. It is related to myrrh, frankincense, etc., and was formerly in repute as a medicine throughout Europe, but at the present time is chiefly useful in the arts as a varnish for maps, drawings, etc.

Mastication, or **Chewing**, the thorough subdivision of food in the mouth so that it can be readily acted upon by the gastric juice and other digestive secretions. It is the first step in the process of digestion, and is effected by the joint action of the teeth, jaws, tongue, cheeks, and lips. The three last named push the food material between the teeth, and by the lateral and up-and-down motions of the lower jaw it is cut and torn by the incisor, canine, and bicuspid teeth and bruised by the molar or grinding teeth. In the act of mastication the temporal and masseter muscles close the mouth, the mylohyoid and digastric open it, and the pterygoids produce the lateral movement of the lower jaw. These muscles operate by means of the inferior maxillary branches of the fifth pair of nerves. At the same time with the actions above described the food is softened by the saliva (insalivation), which exudes abundantly from the salivary glands by the act of mastication. Typical mastication is seen only in the higher vertebra. "The amphibian bolts its fly, the bird its grain, and the fish its brother without the ceremony of chewing," but in man and the higher animals mastication is necessary for complete and comfortable digestion. The chemist, to dissolve a substance quickly and thoroughly, first pulverizes it in a mortar. Thorough comminution of food by mastication is analogous to the pulverizing process employed by the chemist, but associated with mastication is insalivation, as it is almost impossible to swallow substances which are very dry. Imperfect mastication of food, either by reason of rapid swallowing (bolting), or because of the absence of sound and serviceable teeth, is very frequently the cause of the numerous ailments classified under the term indigestion. Digestion in the stomach and small intestine is made difficult and more or less painful.

Mas'tiff, a breed of dogs of great size, recognized by the large head, the dependent lips, the broad, hanging ears, and by the general muscularity of the form. The mastiff in general disposition is affectionate and gentle, extremely faithful and vigilant. In Rome and in classical ages these dogs were held in high estimation for their strength and courage. The most valued breeds were obtained from Great Britain, where these dogs originated, and were used to guard flocks and herds; and watching has become instinctive with them. Roman officers were appointed to breed them and to transmit them periodically to Rome, where they fought lions, etc., in the arenas of the Roman amphitheatres and were otherwise favorites. The dog now is highly valued, both as a watchdog, and as a domestic companion. Fawn is the prevalent color, and the weight should be about 165 pounds.

MASTIGOPHORA — MATANZAS

Mastigoph'ora, a class of Protozoa "in which the flagellate form is prominent although the amœboid and encysted conditions frequently occur." Typical forms are contained in the order *Flagellata* (q.v.).

Mast'odon, a genus of fossil proboscideans of the elephant family, whose remains are found in all parts of the world in Tertiary formations from Miocene time onward to the dawn of the present era. Although in size and external appearance the larger mastodons much resembled modern elephants, save that, like the mammoths, the northern species were probably clothed with long hair, they differed widely from other genera of the family in details of structure, especially those affecting dentition. Thus milk-molars were present, and sometimes were persistent; and in their structure the fossil molar teeth are not penetrated by deep partitions of cement, and their crowns are marked by few (3 to 5) transverse ridges, which are often broken into nipple-like protuberances. This is, in short, the simplest form of tooth-structure in the family, of which the mastodons are the oldest and most primitive type, and nearest to the earlier *Dinotheria*. The tusks curved upward in growth, sometimes completing a circle. Their length in *Mastodon Americanus*, whose remains have been obtained nearly entire from bog-deposits in various parts of the United States, was about 9 feet, indicating, as do the measurements of the skeleton, an animal about equal in average height to the modern Indian elephant, but with a rather more bulky body and a flatter forehead. Of this species several good skeletons are preserved in the museums of the United States and Canada, and certain European species are also well known. About 30 different kinds of mastodons have been described from bones found in almost every country in the world. What brought this widespread group to an end is not clear. There was no diminution in their food, which consisted of herbage, bark and leaves, as is known from undigested stomach-contents found within the skeletons; and they survived the historic vicissitudes of climates until subsequently the present settled conditions arrived. There is good reason to believe that they lasted in America, at least, until after the advent of mankind, but indisputable evidence of this is lacking.

Consult: Woodward, 'Vertebrate Paleontology' (1898); Lucas, 'Animals before Man in North America' (1902); 'American Naturalist,' Vol. XVI., pp. 75, 277 (1882).

Matabeleland, mā-tā-hā'lē-lānd, South Africa, the southeastern district of Rhodesia (q.v.) between the Limpopo and Zambesi, north of the Transvaal. In 1889 it came under the administration of the British South Africa Company, against whom the natives unsuccessfully rebelled in 1893 and in 1896. The Matabili are a war-like Kafir race, who migrated from Natal in 1827 under their chief Umsilikatse. The country is traversed by ranges of hills,—the Matoppo Hills being the chief—is watered by numerous streams, has good pasture, and is believed to be rich in gold. It is now being rapidly settled and developed. Buluwayo is the capital.

Matachin, măt a chēn', or **Matachine**, "the dance of fools," a former well-known comic

dance performed by maskers in mock-military guise. It was common in France and Italy. The dance itself was merely a display of tumbling or acrobatic feats.

Matador', in Spanish bull fights the man appointed to administer the fatal stroke to the bull. See BULL-FIGHT.

Matagalpa, ma-tā-gāl'pā, Nicaragua, town, capital of the department of Matagalpa, north of the central part of Nicaragua. It is situated in a fertile agricultural region, in which the chief products are tobacco, coffee, and sugar. The lack of railroads has been a hindrance to the growth of the town; but plans are formed for connecting it with the Pacific and with Namagua, the capital, and other cities. The inhabitants are mostly Indians. Pop. (1903) about 11,000.

Matamat'a, a large fresh-water turtle (*Chelys fimbriata*) of the Amazon and Orinoco valleys, which has a flat, weak, but heavily embossed shell, and lies in concealment among the weeds. Its neck is very long, the head is small, the nose is extended into a flat tubular proboscis, and the jaws are so weak and soft that it is evident nothing can be forcibly seized with them. Hence it is believed that the frogs, small fishes and the like, upon which this turtle feeds, are sucked into the throat rather than bitten. To facilitate its concealment against both enemies and expected prey, the head and neck of this remarkable creature are covered with an outgrowth of fleshy fringes, which float about in the water, like tangled weeds, hiding its identity most effectively. Consult Gadow, 'Amphibia and Reptiles' (1901).

Matamoros, Mariano, mā-rē-ā'nō mā-tā-mō'rōs, Mexican patriot: b. Mexico about 1770; d. Valladolid 3 Feb. 1814. He first appears in 1810 as substitute priest of the parish in Jantetelco, a village south of Mexico city. In 1811 he identified himself with the revolt of Hidalgo (q.v.), and became the principal commander under Morelos (q.v.). He attained the rank of lieutenant-general on 19 April 1813. On 14 Oct. 1813 he gained the victory of San Agustín del Palmar, and on 5 Jan. 1814 was captured at the defeat of Purwaran. He was executed in Valladolid market-place.

Matamoros, Mexico, a frontier town and river port opposite Brownsville, Texas, on the right bank of the Rio Grande del Norte, about 30 miles above its mouth in the Gulf of Mexico. It consists chiefly of brick houses; around the public square stand the church, town-house, custom-house, and a number of elegant private dwellings. A considerable trade is carried on with the United States; horses, hides, wool, etc., are exported, and manufactured goods imported. During the Mexican War in 1846 the town was occupied by American troops under General Taylor. Pop. (1894) 7,312.

Matanzas, mā-tān'zas (Sp. mā-tān'thās), Cuba, a seaport city on the north coast, capital of Matanzas Province, 52 miles by rail east of Havana. It is situated on Matanzas Bay, one of the largest, safest, and most convenient harbors of the Western hemisphere. The city is well-built with wide, regular, and paved streets, handsome plazas, and public buildings, and good railway communications. The caves of Bel-lamar, and Yumuri Valley, in the neighborhood,

MATAPAN — MATCH INDUSTRY

are two popular natural resorts. Matanzas ranks in importance next to Havana in the export of sugar, molasses, and coffee, the exports of sugar alone averaging annually about \$15,000,000. The city was bombarded by the United States warships during the Spanish-American War in 1898, the only casualty, widely telegraphed, being an injury to a "Matanzas mule," which made the animal famous. Pop. (1899) 36,374.

Matapan, mā-tā-pān', Cape. See CAPE MATAPAN.

Match Industry. The original discovery of the ignition of phosphorus and sulphur by friction was made by Godfrey Haukwitz in 1680. About 150 years later, Walker, of Stockton-on-Tees, invented the friction light. Two or three years prior to that the famous instantaneous-light boxes were in use. These Eupyrions and Prometheans consisted of sticks of wood tipped with sulphur and chlorate of potash, which ignited on being dipped into sulphuric acid, and they retailed at a very high price. The lucifer or improved friction-match succeeded them in 1833. The first patent granted in the United States for a friction-match was to Alonzo D. Phillips, of Springfield, Mass., 24 Oct. 1836. The splints were whittled out by hand at first, and continued to be made in a crude way until 1842, when Reuben Partridge patented the first splint-cutting machine. Red or amorphous phosphorus had been discovered by Schrotter, a German, in the early 50's; and used by Lundstrom of Jönköping, the original Swedish safety-match manufacturer, as early as 1855-6. In England there was an average daily output of 40,000,000 matches in 1856.

The production of matches has been attended with a great amount of misery which is incidental to the business. People of scrofulous or delicate constitution who are brought in contact with phosphorus in handling matches, or who daily inhale the fumes of phosphorus, are frequently attacked by a most distressing disease called necrosis of the bone. It usually attacks the lower jaw-bone; when it attacks the upper jaw-bone death is almost certain. In the early history of match-making the business was driven by competition into the hands of the poorer classes of people in London and in other large cities. The manufacture was in cellars; and so numerous became the cases of this most loathsome disease that the different governments drove the manufacturers out of the cellars and ordered that they work in better-ventilated buildings. Later the evolution of machinery lessened the number of people employed, and reduced the danger of disease to the minimum. The wood from which the match-splints are now made is pine plank, two inches thick, which, after being thoroughly dried, is re-sawed into lengths from one and seven eighths to two and one half inches, representing the length of the matches to be made. The knots and cross-grained parts are cut out of the blocks, and these blocks are put into the automatic feeder of a machine, the paraffine and composition for the head of the match having been properly prepared and placed in their respective receptacles, where they can be replenished without stopping the machine. The knives or dies that cut the match-splint from the block are so placed in the head-block of the machine that when the splints are cut they are separated by a quarter of an inch, and placed

or set in cast-iron plates made into an endless chain by link attachments. At each revolution of the machine 44 matches are cut and set, the machine making 175 to 250 revolutions a minute, its rapidity depending on the length of the match and other conditions. From the cutting end of the machine the endless chain moves along over a drying or heating block prepared for this purpose, where the match-splint is heated to a degree nearly equal to that required to melt paraffine, so that the paraffine may not chill on the stick when the splint passes through it, but that the end may be thoroughly saturated. The chain moves on to the composition rollers, where the match receives its head, and then comes in contact with blasts of cool, dry air for an hour and a half, when it returns to the place of beginning, just before reaching which the matches are punched out of the chain by an automatic device into small paper or strawboard boxes varying in size, containing 65 to 500 matches, the boxes having been fed into the machine automatically. The boxes pass from the machine to a rotary table, around which sit two or four girls, who place covers on them, and then pack them into cases.

The world is indebted for the present perfection of these machines to the policy of the great American combination, controlling almost the entire outfit, the Diamond Match Company, which has employed, since its organization in 1881, a corps of expert inventors and mechanics for the invention and improvement of its machinery, and to the inventors themselves, chief among whom are E. B. Beecher, of Westville, Conn.; McClintock Young of Frederick, Md.; J. P. Wright of New Haven, Conn.; Joseph Baughman of Akron, Ohio; Charles Palmer of Akron, Ohio; and John W. Denmead of Akron, Ohio. A corresponding advance has been made in machinery for the manufacture of paper and strawboard boxes used in the match business, mostly invented by E. B. Beecher. A roll of strawboard of proper width, lined with white or colored paper, is placed in the machine, which takes it and scores the board for the corners without cutting or breaking its fibre. The strawboard is then glued by an automatic device and folded into an endless tube, passing on in that form through printing-presses that print three sides of the tube. It is then cut into proper lengths. Passing on in the machine, it is sanded on the fourth side, which makes the rubbing surface for the ignition of the match. These covers are turned out from the machine at the rate of 450 a minute, and the boxes proper are made in a similar way, by machinery which folds and glues them in shape. The present manufacture of matches in the United States consumes at least 2,000,000 paper or strawboard boxes a day, which, if made by hand, would require at least 1,500 people; to operate the machines that make these boxes not over 75 people are needed. In England and the Continent hand-made boxes, the product of home labor of the most poverty-stricken class, are still used. In general such machinery as is used abroad is out of date.

English and Continental firms long used machinery 30 years behind the times, and about 300 per cent more expensive. To-day they are using match machinery invented by Americans over 30 years ago, while Americans are using machinery that is making a saving in labor over that referred to of 75 per cent. The Diamond

MATCHLOCK—MATERIA MEDICA

Match Company in the 90's built in Liverpool, England, the largest match factory in the world, for the introduction of the latest and best-known methods for the manufacture of matches.

The effect of this automatic machinery of the match industry is easily summed up. In 1880, before the organization of the Diamond Match Company, there were in existence throughout the United States 37 match factories, employing about 2,200 people. The total product of all these factories at that time was 2,200,000 gross per annum, which constituted at least 95 per cent of all the matches that were consumed in the United States, there being but very few imported; in 1890 with 1,700 employees nearly four times as many matches are produced, the greater part of which are consumed in this country, and manufacturers' prices were reduced from 50 to 75 per cent.

A very large portion of the material used in the composition for the heads of the matches in this country is imported. Chlorate of potash, of which there are consumed in matches in this country 1,500,000 pounds per annum, is all imported; and the same is true of some other chemicals used, notwithstanding that they could be prepared here as cheaply as in Europe, barring the difference in the price of labor. Low wages is the most striking thing in foreign match factories, girls in Italian factories getting between 9 and 20 cents a day. The lack of labor-saving machinery in Europe is no doubt due to the absence of the stimulus of high wages.

In 1900 the number of employees had risen to 2,047, although the number of factories was only 22. The following figures show the development of the industry:

	1880	1890	1900
No. of establishments...	37	27	22
Capital	\$2,114,850	\$1,941,092	\$3,893,000
Wage-earners	2,219	1,696	2,047
Wages	\$ 535,911	\$ 473,556	\$ 612,715
Value of products...	\$4,668,446	\$2,193,638	\$6,005,937

Before the business of manufacturing matches in the United States was so completely in the hands of the Diamond Match Company matches were made by nearly 40 different companies, whose product, in spite of competition, was sold at about three times the present price of matches, although it was frequently worthless. By the incorporation of the Diamond Match Company the system was so revolutionized that one store in each of the larger commercial centres supplies the public need for matches with greater facility than in the olden times, and very few traveling men are now found necessary in this line of business. To lessen still further the expense of the production of matches, the Diamond Match Company adopted the policy of making the company as self-supplying and independent as possible, and invested millions in manufacturing many of the articles used in the making of matches, and in pine forests, and large mills for the reduction of pine-trees to lumber for splints by the most economical methods, in order that all possible waste may be avoided. A comprehensive system of factories to supply the want of matches has been advantageously distributed through the country.

The difference between this company and a monopoly is illustrated by a comparison of it with the French governmental match monopoly. The revenue or profit derived from it is

somewhat over \$4,000,000 per annum, and the cost of matches to the French people is quite four times what is paid for better goods in America. The quality of the French match is poor and its cost to the manufacturer much higher than in the adjacent country of Belgium.

The method of distribution of matches in the early 50's was by canal or wagon—at least in the West, when there were few railroads in Ohio and west of Ohio, and the roads then running would not transport matches, as they were considered too dangerous. It was only in the early 60's that railroads began to carry matches. During the same time business was equally primitive, barter being much more common, especially in the Middle West, than cash sales. The evolution from these methods to those of to-day is quite as remarkable as the evolution in mechanical development. Matches are still imported, notably from Sweden, the annual figures during the last decade of the 19th century varying from \$93,180 in 1890 to \$207,671 in 1897. The figures for 1900 were nearly \$157,000. Exports show a steady growth in spite of cheap foreign labor, and now average about \$100,000 a year.

O. C. BARBER,

President Diamond Match Company.

Match'lock, an old form of musket fired by means of a match. They were invented in the 15th century.

Mate, an officer in the mercantile marine who acts as the assistant of the captain or master. There are four grades—first, second, third, and fourth mate. The junior mate has usually the superintendence of the stowing of the vessel. The law recognizes only two classes of persons in charge of a trading vessel—the master and the mariners, the mates being included in the latter. In the navy, the term mate is now limited to the assistants of certain warrant officers, as boatswain's mate, gunner's mate, etc.

Maté, mǎ'tǎ. See PARAGUAY TEA.

Mathuala, mǎ-tǎ-wǎ'lǎ, Mexico, a southern town of the state of Nuevo León, with silver-melting establishments and important silver mines in the vicinity. Pop. (1895) 8,300.

Materia Medica (Lat. "medical matter"), that division or branch of medical science which treats of drugs, their origin, classification as natural products, preparation, purification, action on the animal economy, together with the mode of administering them for the relief and cure of disease. The action of the various agents in the materia medica upon the human family has been ascertained by experience, sometimes by experiment, especially by administering various drugs to some of the lower order of animals such as dogs, cats, rabbits, guinea pigs, rats and mice. Perhaps the best general classification of medicines, is as stimulants, sedatives, narcotics, emetics, alteratives, tonics, anæsthetics, antispasmodics, astringents, spinals, cathartics, diaphoretics, diuretics, blennorrhetics, emmenagogues, hæmatinics, antacids, irritants, demulcents, coloring agents, and anthelmintics. This classification is based upon the direct effect of the different drugs upon the tissues of the human economy under the various headings which drugs may be conveniently grouped under four general sections, namely: 1. Those which have a special action on the brain, spinal cord and

MATERIALISM — MATHEMATICS

the general nervous system. 2. Those which have a special action on the secretions. 3. Those which change the blood. 4. Those which act locally, when applied to the surface of the body. Section (1) includes antispasmodics, anæsthetics, astringents, narcotics, tonics, sedatives, spinants, and stimulants. Section (2) includes the emetics, emmenagogues, blennorrhætics, diuretics, diaphoretics, and cathartics. Section (3) includes alteratives, antacids, and hæmætinics. Section (4) includes anthelmintics, coloring agents, demulcents, and irritants. See THERAPEUTICS; PHARMACOPEIA.

Mat'erialism, in philosophy, a system which denies the existence of a spiritual or immaterial principle in man, called the mind or soul, distinct from matter; or in a more extended sense, the doctrine that is founded on the hypothesis that all existence may be resolved into a modification of matter, including, of course, the conscious subject. As held by the ancient philosophers Democritus and his later disciples, Epicurus and his sect, and, though in a somewhat different sense, by the Stoics, materialism is equivalent to atheism, as it recognizes no Divine Creator, no place of future rewards or punishments, and no immaterial principle in man. Tertullian, contending against the excessive spiritualizing tendencies of the Platonic schools, maintained that the Scriptures taught that the soul was corporeal and had a beginning; the Deity, he also held, had a body. The system of Hartley admits the existence of a soul, but seems to imply materialism, as it attempts to explain mental phenomena physically, or by movements arising out of the bodily organization. Dr. Priestley has more formally than any other writer enunciated the principles of materialism in the pure and proper sense of the term. He denies the existence of a separate immaterial principle in man, called the mind or soul, which he thinks could not exist in union with the material body; he thinks, further, that all mental phenomena may be explained by means of supposed movements arising out of the physical organization. Adopting Hartley's hypothesis of medullary vibrations, he defines mental phenomena as medullary vibrations perceived; and he contends, principally from the analogy of brutes, that physical organization is adequate to produce perception. But, while denying the existence of a soul, he does not deny the immortality of man, a future state of rewards and punishments, nor the existence of a God. Hobbes goes further than Priestley, as he denies in one part of his works the existence of spiritual beings; yet he makes God the foundation of moral and political science. There being nothing, in his opinion, but matter in the universe, it follows that God is matter.

In more recent speculation materialism has been determined by the doctrine of evolution. Materialism indeed might be said to have been absorbed in the wider theory of evolution, which goes beyond the mere antitheism or atheism of materialism, and seeks *positively* to show how the diversities and differences in the world can be accounted for by natural as opposed to supernatural or creative process. Materialism cannot furnish a complete or consistent ethical theory. If man is entirely the product of natural forces, and in

fact the sport of natural forces, it is meaningless to think or speak of him as morally obliged either to follow or to resist nature. Man not only follows and resists nature, but in mechanical and artistic construction commands and anticipates and surpasses nature. Of course, to materialism the belief in human freedom, which practically makes history, is an illusion, but it is difficult to see how on the materialistic hypothesis even this illusory belief could have arisen.

Materna, mǎ-těrnǎ, **Amalie**, Austrian opera singer: b. St. Georgen, Styria, 10 July 1845. She studied music at Gratz; played there on the comic stage; married Carl Friedrich, an actor, in 1864; and in the same year went to Vienna for an engagement in the Carl-Theatre, which she left in 1869 for tragic opera, playing 'Selika' in that year. Her greatest successes were as Brunnhilde in Wagner's 'Ring of the Nibelungs' and as Kundry in 'Parsifal.'

Mathematical Society, The American. See AMERICAN MATHEMATICAL SOCIETY, THE.

Mathematics is a word derived from the Greek *mathema*, which may be translated, "learning." As a science, mathematics has for its subject, abstractions or mental concepts concerning the nature of which, after they have once been defined, there can be no dispute, and its object is to develop the consequences that follow from these definitions, in accordance with established laws of pure reason, and the admitted relations existing between the particular group of abstractions considered. Mathematics is, in its broadest sense, a branch of the science of the mind, and every mathematical formula expresses either the consequence of an operation or a law of the understanding. Whatever is meant by the words "space" and "time," constitutes the necessary condition in which human thoughts crystallize, and Kant's definition of mathematics as the science which treats of the laws of space and time, is good, except that it is difficult, if not impracticable, to resolve the idea of number and the theory of numbers into such elements. A conception is mathematical, even when so complicated as to include the whole of any branch of the science, when it can be resolved into and demonstrated to be dependent upon a few elements, or, conversely, can be built up after establishing a few simple abstractions by applying thereto the established laws of thought. The first of these tests constitutes the analytic method, and the second is the synthetic method. The demonstration of a more or less complicated mathematical conception always involves the application of one or the other of these methods of thought, and both are always involved directly or indirectly.

Definitions are descriptions in words that render the primary abstractions of the mind clear and certain, and these constitute the first

MATHEMATICS

class of mathematical elements. They are to the highest degree creations of the mind, that may or may not find counterparts in the phenomena of the external world. Their utility may depend to a degree on the existence of such counterparts, but their reality can only be questioned by denying the existence of thought, even when they transcend the power of the imagination. The chemist, in describing some mineral, may present all its attributes, color, mass, density, volume, molecular construction, and its properties exhibited in relation to heat, light, sound, and electric waves, and the resulting conception will not be mathematical. On the other hand, in describing its form as cubical, he relies upon the purely mathematical abstraction involved in the definition of a cube, which includes that of the mathematical plane, which involves the geometric line, which, in turn, resolves into an assemblage of points. Not one of these conceptions finds its realization in physical phenomena, but at best, an approximation. The types conceived by the mind remain, however, definite and unchangeable. The idea of the ultimate element, the "point," best illustrates the nature of these abstractions, and involves the first difficulty that lies in the way of the understanding. The point is defined as having but one positive attribute, and that is, position in space. Magnitude, in the sense of occupying space or having length, breadth or thickness, color and all other properties, cannot be associated with this abstraction. Consider a series of cubes, each equal in volume to one half of the one preceding. The mind soon fails to find any standard whereby comparison will enable it to form an adequate realization of the smallness attainable by these magnitudes, and still refuses to admit that a cube will ever be obtained by this process that will cease to occupy space, or that, theoretically at least, will not be susceptible of division. The mathematical point cannot be realized by this process, for the resulting principle is this: all material things are indefinitely divisible, and, no matter how small, possess magnitude and occupy space. The negative of this thought is the point, which does not have magnitude, but position only. It is a negative thought concept, a mathematical abstraction that may have its correspondence in space phenomena in any magnitude, without regard to size, by which it may be desirable to represent it. The familiar proof attributed to the Greek philosopher Zeno, that a short line contains as many points as a long line, finds an explanation of the paradox involved in attributing to points the property of occupying space, after having defined them as without magnitude. To the extent that conceptions involve the idea of space, the attributes of space, position, extension and direction, and motion in space involving change in position, extension and direction, are assumed or postulated.

Time and Space.—Change of state involves what is meant by the word "time," which, like space, is a necessary condition for thought, or the formation of concepts. These occur in succession, as do all phenomena involving a change, and, whenever motion or change is involved, time is required, and the universal knowledge of this fact is an elementary abstraction. Unity, apart from any concrete thing that in any given discussion may be assumed as such, is the primary abstraction in arithmetic, and number

and the theory of numbers grow from this concept to one of great importance. Since time and space are necessary to the realization of sensible objects and the phenomena of motion, the attributes of time and space adhere of necessity to the theory of these subjects, and hence the principles demonstrated in the abstract concerning time and space relations, are applicable to such phenomena. Herein lies the secret of the universal application of pure mathematical deductions to the many sciences that sum up human knowledge of the universe.

Axioms.—Forming the second class of abstractions are the so-called "axioms," or relations assumed to be self-evident, and postulates or problems requiring something to be done that admittedly can be accomplished. "If equals be added to equals, the results will be equal," is one of Euclid's axioms. The two stated postulates of his plane geometry are: "A straight line can be drawn joining any two points, and extended indefinitely"; and, "with any point as a centre, and with any radius, a circle can be described." These admit the use of two instruments, the straight edge and the compasses only. In addition, the principle of superposition is tacitly assumed by Euclid, which requires two identically equal magnitudes, to occupy the same position. From these two classes of elements, universally recognized and admitted and taken as premises, the complicated mathematical conceptions called propositions are deduced by a series of logical arguments; and these may be taken as a third class of abstractions that, in turn, may be used upon occasion as elements in succeeding demonstrations. In the foregoing illustration of the nature of mathematics as a mind science, Euclid has been followed, and those conceptions stated that arise from experience in time and space. Deductions from these possess the advantage of general application to the phenomena of the objective world, so long as they are susceptible of measurement by comparison with some standard, although the abstractions themselves may not have involved the notion of a unit. Departments of knowledge like psychology, aesthetics, art, law, medicine, political economy, the phenomena of which are real, and which admit of comparison but not of exact measurement, do not lend themselves readily to mathematical treatment. Axioms are still employed, logical deductions are accomplished, but either the primary concepts are not established with sufficient clearness and generality, or there are no standards of exact measurement such as we find in astronomy, mechanics, navigation and engineering. Still, the attempt can be made. Most philosophers were mathematicians; Spinoza's philosophy is mathematical, and political economy and art have advocates of their mathematical treatment.

Pure Mathematics.—Without a dividing line that is easily traced, mathematical subjects are separated into pure mathematics and applied mathematics. In pure mathematics, the primary concepts are established and the quantities considered are abstract and treated without special reference to physical phenomena. The results are absolute, and create a typical mental universe which is so certain that a conception resolves into the same elements, although widely differing trains of thought are followed. It is enough that these conceptions are possible, although they transcend the bounds of actual ex-

MATHEMATICS

perience, and do not admit of illustration by material examples. If, as in the geometry of Euclid, and in elementary algebra or trigonometry, the primary abstractions are typical of our tri-dimensional phenomena, the results usually admit of particular illustration by means of diagrams, and are so uniformly applicable to the development of the natural or physical sciences as to render the absence of such a test, a practical searchlight on some, as yet, unexplored physical truths. Strange, to this practical age, is the fact that the application of his results, although fundamental and far-reaching in their effects upon civilization, are to the pure mathematician an incident and not the object of his work. It is enough that he has discovered a new verity, a type, perchance, on which the universe may be based; for, like Pythagoras in his exaltation, he reads the thought of God after him. In this rarefied atmosphere there is something grotesque and debasing, something to be regretted in a practical application, and, as the students of Plato found in the death of Archytas by shipwreck, a just punishment for applying his geometry to mechanics, so, even to this day, there are spirits who regard the utilitarian with undeserved contempt. The practical man digs perchance with a muck rake while the gold crown is extended above his head, but on the other hand, he occasionally discovers a diamond.

Applied Mathematics.—Whenever the principles of pure mathematics are employed in association with the properties of natural objects and the laws that govern their relations, both of which are inductions based upon experience, and supplemented by countless experiments, the conceptions then evolved in accordance with established laws of reason are due to a mixture of abstractions that form the subject matter of applied mathematics. These laws that govern

material phenomena are themselves abstractions, and once accepted, mathematical results based thereon, can only be impeached by a demonstration of the fallibility or inaccuracy of the assumed law. Some of them, like Newton's law of gravitation, are accepted like axioms as universally true. Others, like the laws of friction, are admittedly only approximations to the truth. On this account, applied mathematics is not the exact science, in which respect pure mathematics stands alone. The debt that applied science owes to pure mathematics is fully repaid by the vast regions of thought discovered and open to the researches of the mathematician by the patient workers in physical phenomena. The old quarrel is over, and with mutual respect, mathematician and physicist toil in a common field, where the border line is never drawn. The subjoined simple classification can be indefinitely extended, and altered in its ultimate ramifications according to the point of view of the writer.

Mathematical Conceptions.—An important classification of mathematical conceptions depends upon their relation to the fundamental elements to which a reference was made in the general definition of the science. In general, a conception is said to be a function of its elements; where one idea or one quantity is a function of another when any change in the element will, in general, effect a corresponding change in the function. The least number of elements necessary to a mathematical conception is called its "manifoldness." If the abstraction called a "continuum," one of the most important in mathematics, is involved, the function or the manifoldness is said to be continuous, and this occurs when, by making a change in the element sufficiently small, the change in the function may be made less than any value that

MATHEMATICS

can be previously assigned. If this idea is not involved, the function or the manifoldness is said to be discrete. For example, the position of any point on a straight line, and therefore the point, is determined when its distance from an arbitrarily chosen point on the line is assigned. The number of such points is without limit or infinite, and the total assemblage constitutes a one-fold continuous manifoldness. The position of a point in a plane requires that two distances be assigned, and the assemblage of points in the plane is therefore a two-fold manifoldness. In general, if n elements or arguments are required to determine the conception, the manifoldness is n -fold. If, on the other hand, the line itself, considered with respect to its position in space, is the concept, it is a four-fold discrete manifoldness, since four elements are required to determine this abstraction.

Historical Development.—While reviewing briefly the historical development of the major branches of mathematics, the most important abstractions that are more or less peculiar to them will develop naturally. The important subjects concerning the nature of notations and operations are treated under separate heads (see ARITHMETIC, ALGEBRA, GEOMETRY, etc.). Arithmetic is entitled to a first consideration, not because it was first developed as an abstract science, for this place is due to geometry, but because no race of human beings has ever been discovered that were unable to count. At least, like animals, they could distinguish between one and two or between one and many. We know that the Chinese, the Hindus, the Egyptians, the Babylonians, the Chaldeans, the Hebrews and the Phœnicians were familiar with a few principles of arithmetic, geometry, and algebra, learned from experience, or developed for the most part empirically, to serve the requirements of trade, land surveying, navigation and astronomy. The higher the civilization, the greater the number of mathematical truths evolved, but even the remarkable attainments of the Egyptians, the Phœnicians and the Hindus will hardly justify attributing to them the development of a mathematical science. The manuscript known as the "Rhind papyrus," written by an Egyptian priest, Ahmes, between 1700 B.C. and 1100 B.C., and claimed to be a copy of a work performed about 3400 B.C., is the oldest mathematical treatise yet deciphered. It is a collection of problems in arithmetic and geometry called 'Directions for Knowing all Dark Things,' and doubtless represents the Egyptian contribution in mathematics to the Ionian Greeks. Historically mathematics as a science has received its development in three great periods. The first period is that dominated by Greek influence, and its beginning is usually attributed to Thales, 600 B.C., one of the seven wise men of Greece, and concluded with the destruction of the library at Alexandria by the Mohammedans, about 641 A.D. Its chief characteristic is the development of geometry. The second period coincides with that of the Middle Ages and the Renaissance, beginning about the 6th century and ending with the invention of analytical geometry by Descartes, about 1641 A.D. It is characterized by the development of arithmetic, algebra and trigonometry. The third period then begins with Descartes, and the infinitesimal calculus of Newton and Leibnitz, and includes the development of modern mathe-

matics, which, in the variety and complexity of its results, transcends the power of any one mind to grasp in its entirety. It is chiefly remarkable for the development of the principles of analysis, and applied mathematics.

Arithmetic has for its primary operation, numbering and counting, and most of its abstractions are to be classed with those involving discrete manifoldness. All the operations of arithmetic are based upon three laws, known as the commutative, the associative, and the distributive, which are also fundamental in the calculus of operations in every branch of mathematical science, although occasionally, as in Quaternions, one or more of them may be established as not true, for especially defined operations. Arithmetic was the first science to establish a notation, that is a system of letters, figures or signs, to represent thought concepts, and which serve to aid the memory and to abbreviate processes. The fingers of the hand were and are the first aids, and the primary numbers are called digits. The fundamental operations of addition, subtraction, multiplication and division are represented by signs, and in mathematics generally, symbols used to denote operations are distinguished from those that denote quantities. The decimal notation now universally employed is known as the Arabic notation, inasmuch as it was introduced into Europe as based upon the work of Arabian mathematicians, and especially upon that of a librarian of the Caliph popularly known as Alkarismi (830 A.D.). This arithmetic was therefore known as algorism, and became fairly well established throughout Europe in the course of the 17th century. Alkarismi is known to have visited India, and his work is, admittedly, based upon that of the Hindus, and in particular upon that of Bramagupta (598 A.D., 660 A.D.). To the Greek philosopher, Pythagoras (569 B.C.), a contemporary of Thales, should be accredited the honor of first raising arithmetic above the requirements of trade, and of establishing it as a science. "A figure and a step forward; not a figure to gain three oboli," was his maxim, and he sought to build a theory of the universe based on the properties of numbers. Euclid, Apollonius, Archimedes and Diophantus contributed to Greek arithmetic, but the sum total of their results pales into insignificance in the light of the modern development of the theory of numbers, with which are prominently associated the names of Fermat, Euler, Lagrange, Legendre, Gauss and Smith. The invention of logarithms by Napier (1550 to 1617), and the improvement wrought by Briggs (1556 to 1630), facilitated enormously numerical calculations, and shares with the infinitesimal calculus of Newton the honor of being the greatest contribution to the science of pure mathematics made by the English-speaking people.

Geometry has for its subject mathematical abstractions that arise from a consideration of space. Types of material objects are considered only in so far as they occupy space, and no reference to any other physical property is involved. Certain properties of space are therefore and of necessity postulated; first, that it involves the notion of extension, which has dimensions, as for example, length or breadth or thickness, and that this holds true for any portion thereof. That extension in general is infinite, or incapable of expression in terms of finite units of ex-

tension, and that on the other hand, any portion of space is capable of division without limit. Another element is the notion of continuity, which is an attribute of both space and time, where as it may or may not be associated with a system of numbers or of quantities. Assuming these elements, geometry then confines its attention to typical abstractions, some of which, like points, lines and surfaces, serve to describe form concepts or to limit portions of space, whereas others, like the cube, cylinder and sphere, occupy space. These may be treated with respect to their elements, their relative magnitudes, and their relative positions. The subdivisions of geometry depend upon the point of view. Elementary geometry, based upon the work of Euclid, treats of straight lines, portions of planes bounded by straight lines, solids bounded by portions of planes, circles, cylinders, cones and spheres and ratios of magnitudes. The theory of all curves except the circle, and of all surfaces and solids involving any curve except the circle, is associated with advanced geometry. The straight edge and the compasses are the only instruments permitted by Euclid in drawing graphical representations, and any problem necessitating the use of any other instrument is said to be impossible in elementary geometry. For example, the three famous problems of antiquity, the squaring of the circle, the trisection of any angle, and the duplication of any cube, can all be solved in advanced geometry, but are impossible if subject to the limitations prescribed by the Greeks. Elementary geometry affords the best example of the synthetic method. Analysis, although necessarily involved, is never emphasized, but the proposition is enunciated and proved step by step, with careful attention to logical form, until the truth of the conception stands revealed firmly grounded on the elements. An additional process of reasoning, called *reductio ad absurdum*, and which the Greeks called analysis, is admissible, if necessary as a last resort. It consists of the statement of a proposition as true, and then, pursuing a course of logical reasoning based thereon, until a conception is reached, known to be either true or false, thereby verifying or controverting, as the case may be, the truth of the primary proposition. These methods are evidently as natural as they are ancient, and therefore as an instrument for mental discipline, Euclidean geometry still holds the first place, unchallenged by any other science. It assists, in particular, the cultivation of logical reasoning, ingenuity and imagination by a series of propositions beginning with the very simple and proceeding to the most complicated. It may be said to constitute the Greek method of thought, ranking so high in their estimation that Plato is credited with having written above the entrance to his academy "Let none but geometers enter here." The Greeks, especially Euclid, Apollonius and Archimedes, have never been excelled in the application of this method. Thales and Pythagoras brought to Greece all that Egypt had learned in geometry. Euclid (330 B.C. to 275 B.C.) collected and established his principles creating elementary geometry, Archimedes (287 B.C. to 212 B.C.) introduced the "method of exhaustions" that foreshadowed the theory of limits and the infinitesimal calculus of modern times, while Apollonius, without any assistance from algebra, discovered nearly all

the properties of the conic sections, or curves cut from the surface of a cone when intersected by a plane. (See GEOMETRY.) As examples of modern geometry characterized by a greater use of the principles of continuity and concepts involving relative position, but still in the main, synthetic in method, should be mentioned descriptive geometry, created by Monge; the projective geometry of Poncelet, Steiner and Von Staudt, and 'Abzählende Geometrie' or theory of characteristics, associated with the names of Plücker and Chasles.

Algebra.—Modern investigations of space relations, that is of geometry, owe their incomparable advance in the last period to the assistance afforded by algebra, which may be defined as the abstract science of quantity, and which finds its essential characteristic to be the analytical treatment of manifoldness. Inasmuch as algebra finds its origin in arithmetic, Newton's definition of algebra as a universal arithmetic, is sometimes followed. In arithmetic, we need as many symbols or combinations of symbols as there are numbers. If, on the other hand, a question presents itself that involves a general property of numbers, we can represent any number by some letter, a , for example, and it follows that whatever property is predicated of a holds for all numbers. But a can be taken to represent a geometrical magnitude, or time or velocity, and so on, and we therefore observe the necessity for a word to represent them all. This word is quantity, which may be defined as anything that is capable of being operated upon in accordance with an established law. Letters are, therefore, used in algebra to denote quantity, and each letter is defined, to suit the requirements of the case, to represent either a single quantity or any quantity of a class. Having been defined to denote one of a class, it can only be operated upon by the laws applicable to such quantity. The operations, whether those of arithmetic or otherwise, may be and usually are also denoted by letters or their combinations; and, when these themselves are subject to alteration by other operations, they come at once under the general definition of quantity. For example, $\sqrt{-1}$ denotes an operation or a so-called imaginary quantity, primarily; but if operated upon by $\sqrt{-1}$, in harmony with the definition of the square root, we have $\sqrt{-1} \sqrt{-1} = -1$, and if the first factor is an operator, the second is a quantity, and conversely, provided the associative law holds true for this operation. In any case both operator and quantity operated upon must find their interpretation in the laws of operation involved, and these, in ordinary algebra, are those that govern in arithmetic. Known quantities being represented by the first letters of the alphabet, and unknown quantities by the last letters, an ordinary algebraic problem is, to establish a general rule which will determine the unknown quantity from the known, by virtue of a general relation existing between them. And another; to determine a series of quantities, which, when substituted for the unknown quantities, will satisfy the requirements of the general relation existing between them. And, again, from some established or defined relation to determine the other properties of the quantities involved. In this generalizing feature in addition to the analytic method to which it yields, algebra finds its superiority as a

MATHEMATICS

science. From one point of view algebra is the shorthand of abstractions; and it follows, that every true algebraic expression, whose symbols have an established interpretation, is theoretically capable of explanation as the embodiment of some truth concerning the quantities involved. It is clear, therefore, that the development of any science will be greatly facilitated if its concepts can be reduced to a dependence upon algebraic principles. In its association with geometry, this feat was first satisfactorily accomplished by Descartes, which achievement heralded the extraordinary advance of modern mathematics. Comparatively little had been done in algebra prior to his time. It is probable that the Hindus had invented an algebra before the era of the Greek mathematicians, and some rudiments are also apparent in the work of the Egyptians. The Arabs, in the Middle Ages, admit having obtained a few ideas from Hindoo and Greek sources, and were undoubtedly familiar with the masterpieces of the latter, in geometry, mechanics and astronomy. The Greeks, however, were not successful as algebraists, and instead of generalizing a proposition, were, as a rule, content with a large number of numerical examples. It is quite probable that they were able to solve an algebraic equation of the second degree, and in the writings of Diophantus, which represent the maximum of their attainment in the science, we have one, although not the earliest, attempt to introduce a system of symbols to denote quantities and operations. In particular, he made a really great advance by denoting an unknown quantity by x , and using the minus sign to distinguish negative quantities. He belonged to the second Alexandrian school, about the 4th century, A.D. Alkarisuni and his Arabian successors were particularly remarkable for their work in algebra, established rules for solving quadratic and some cubic equations, and introduced many algebraic and trigonometric expressions that are still in use. Their work was transmitted through Spain and Italy during the 12th century, due primarily to the efforts of Leonardo, a merchant of Pisa. The sum total of the achievements in algebra, prior to Descartes, was, however, inconsiderable in comparison with the wonders wrought by the Greeks in geometry. Descartes' great improvement consists in the adaptation of algebra to the needs of geometry; and in particular, to the determination of the properties of curved lines. This was accomplished by inventing a notation fixing, without ambiguity, the position of a point in space by its distances, measured according to a fixed law, from two or more intersecting straight lines, whose positions are given, and by denoting these continuously varying distances by x , y , z . For certain curves, notably the conic sections, it then became demonstrable that although these distances vary and are different for every point on the curve, the same equation, involving these variables and certain constants peculiar to the curve in question, remains unchanged, thereby establishing a general property of the curve with respect to its assemblage of points. Conversely, any relation that can be devised between these quantities establishes an assemblage of points on some curve or surface, and transformations of this equation affected by algebraic operations suffice to analyze and develop its further properties. Although in many of its aspects, and especially in its elementary

considerations, Descartes' method is synthetic before it is analytic, it has usurped the name of analytical geometry. Before the time of Descartes, Archimedes and others had made use of algebra to assist in the development of geometry; and this fact does not constitute the essence of his invention. It consists rather in this, that he presented a method whereby any characteristic property of a curve or surface enabled the mathematician to use this in the formation of an algebraic equation, which must involve, not this principle only but, implicitly, all the other concepts appertaining thereto.

The Field of Research.—Inspired by this new principle, the field of mathematical research broadened in the three centuries that have since elapsed to such an extent as to preclude any description within the limits of this review. It is imperative to consider, however, one other discovery, namely, that involving the concepts underlying the infinitesimal calculus of Newton and Leibnitz. In the calculus we find an analytic method of dealing with continuous as distinguished from discrete quantity, based upon the idea of the limit. A quantity may vary in accordance with some law and continuously approach in value that of some other quantity which, however, by the operation of law, it can never equal. If the difference between the variable and the other quantity can be made less than any previously assigned quantity however small, the latter is called the "limit" of the former. A fundamental conception in the theory of limits, is this, that if two variables are always equal, and they possess limits, these limits will also be equal; that is, given a relation between such variables, it is possible to pass to a true and definite relation between their limits. An infinitesimal is any variable, large or small, that has zero for its limit. Two infinitesimals will have a ratio, and although, in general, the limit of this ratio is indeterminate, in a particular case it may become finite and determinate. Equations between such limiting and finite ratios are therefore established by Newton. But a rate is a ratio and a variable rate, like velocity or acceleration, is the limit of a ratio of infinitesimals. The phenomena of the external world involve the conception of varying motion, and the varying rate of change of continuous and related quantities. The laws governing these phenomena, especially, when physical, are therefore expressible by equations involving limiting ratios of infinitesimals. Again the limit of a sum of an infinite series of infinitesimals, although each infinitesimal has zero for its limit by definition, may be finite for a series established through the operation of particular laws. And, based upon this conception, which involves the inverse operation from that described in forming limiting ratios, we have the integral calculus as the inverse of the differential calculus. These discoveries of Descartes and Newton were therefore peculiarly adapted to the development of mathematics in its application to every department of physical science involving the idea of motion. Applied mathematics, therefore, distinguishes the discoveries in the last period from those of its predecessors. Work in these branches in turn involved and directed a remarkable improvement in algebra and geometry until, as pure sciences, their progress transcends any as yet recognized application in the practical science to which they owe their inspiration.

MATHER

A general review of mathematics prescribes a limitation of the discussion confining attention to the most important fundamental and elementary concepts that underlie this fabric of thought. Number, space, time and the related concepts, expressed by manifoldness, function, continuity, quantity, operation and notation, furnish, therefore, the foundation of the subject. These are included in the primary divisions, arithmetic, geometry and algebra; all other branches of pure mathematics arising from these. They enter the field of applied mathematics when associated with concepts arising from experience and experiment with physical phenomena. The designations of the most important subdivisions of mathematics, associated with a list of elementary and accessible works thereon, is appended.

Bibliography, General.—Ball, W. W., 'A Short Account of the History of Mathematics'; Cajori, 'History of Elementary Mathematics'; Lewis, Sir G. C., 'The Astronomy of the Ancients'; Cantor, M., 'Vorlesungen über die Geschichte der Mathematik'; Montucla, J. F., 'Histoire des Mathématiques.'

Associated with Arithmetic.—Smith, C., 'Arithmetic'; Fine, H., 'The Number Concept'; Bowden, 'Theory of Integers'; Sejeune-Dirichlet, 'Vorlesungen über Zahlentheorie,' with additions by Dedekind; Gauss, 'Disquisitiones Arithmeticae'; Legendre, 'Théorie des Nombres.'

Associated with Geometry.—Euclid's 'Elements,' Greek text (Gregory, Oxford, 1703); 'Euclid's Elements' (Translation, Williamson, Oxford, 1788); Hall and Stevens, 'Euclid's Elements'; Hilbert, 'The Foundations of Geometry' (advanced); Murray, 'Trigonometry' (elementary); 'Non-Euclidean Geometry,' Manning (elementary); 'Analytical Geometry' (elementary), Bailey and Woods; Salmon, G., 'Conic Sections'; Salmon, G., 'Geometry of Three Dimensions'; Salmon, G., 'Higher Plane Curves'; Clebsch-Lindemann, 'Vorlesungen über Geometrie'; Klein, F., 'Famous Problems in Geometry,' translation by Beeman and Smith; Scott, A., 'Modern Analytical Geometry'; Chasles, 'Traité de Géométrie Supérieure'; Carnot, 'Géométrie de Position'; Monge, 'Géométrie Descriptive'; Church, 'Descriptive Geometry'; Cremona, 'Elements de Géométrie Projective'; Steiner, 'Geometrie der Lage.'

Associated with Algebra.—Beeman and Smith, 'Elements of Algebra'; Chrystal, 'Algebra' (advanced); Salmon, 'Higher Algebra'; Burnside and Panton, 'Theory of Equations'; Todhunter, 'Theory of Equations'; Todhunter, 'Algebra'; Serret, 'Cours d'Algèbre Supérieure'; Weber, 'Lehrbuch der Algebra'; Nanet, 'Determinants'; Clebsch, 'Binären Formen'; Gordon, 'Invarianten Theorie'; Taylor, 'Elements of the Calculus' (elementary); Byerly, 'Differential and Integral Calculus'; Echols, 'Differential and Integral Calculus'; Williamson, 'Differential and Integral Calculus'; Hancock, 'Introduction to the Calculus' (advanced); Boole, 'Differential Equations'; Forsythe, 'Differential Equations'; Byerly, 'Trigonometric Series and Spherical Harmonics'; Pierce, 'Newtonian Potential Function'; Boole, 'Calculus of Finite Differences'; Merriman, 'Method of Least Squares'; Durège, 'Elements of the Theory of Functions'; Harkness and Morley, 'Theory of Functions'; Briot

and Bouquet, 'Théorie des Fonctions'; Jordan, 'Cours d'Analyse'; Halphen, 'Fonctions Elliptiques'; Gibbs and Wilson, 'Vector Analysis'; Hordy, 'Elements of Quaternions'; Kelland and Tait, 'Quaternions'; Tait, 'Quaternions'; Hamilton, 'Elements of Quaternions'; Grassman, 'Ausdehnungslehre.'

J. BRACE CHITTENDEN, Ph. D.,
*Prof. of Pure and Applied Mathematics,
Brooklyn Polytechnic Institute.*

Mather, mǎth'ér, Cotton, American colonial clergyman, son of Increase Mather (q.v.): b. Boston 12 Feb. 1663; d. there 13 Feb. 1728. He entered Harvard College at 11, and at his graduation in 1678 President Oakes expressed his expectation that he would resemble his venerable grandfathers John Cotton and Richard Mather, who should be united and flourish again in him. He was early distinguished for piety, and in his 14th year began a system of rigid and regular fasting and vigils which he continued through life. He was occupied after leaving college with teaching, and was for a time diverted from his purpose of becoming a preacher by an impediment in his speech; but having discovered how to avoid stammering by a "dilated deliberation" in his enunciation, devoted himself to theological studies, in 1680 became the assistant of his father in the pastorate of the North Church, Boston, and in 1684 was ordained as his colleague. He discharged his pastoral duties with zeal, pursuing his studies, elaborately preparing his sermons, publishing numerous works of devotion, secretly praying for special and suitable blessings on each member of his church, ejaculating prayers for those whom he met when he walked the streets, and availing himself of every occasion to inculcate lessons of piety. It was his aim also to maintain the ascendancy which had previously belonged to the clergy in New England in civil affairs, but which was then on the decline. When, at the report of the landing of the Prince of Orange in England, Governor Andros was seized and imprisoned in Boston, Cotton Mather prepared the public declaration justifying the measure. But it is in connection with proceedings concerning witchcraft that he is most generally known. In 1685 he published his 'Memorable Providences relating to Witchcraft and Possessions,' narrating cases which had occurred at intervals in different parts of the country; and during the witchcraft excitement in Salem in 1692 was a prejudiced investigator in the matter, publishing the next year his 'Wonders of the Invisible World,' in order to confirm believers in that kind of demoniac possession. In 1702 appeared his greatest work, 'Magnalia Christi Americana,' an ecclesiastical history of New England concerning which he was admitted to know more particulars than any other man. Though strongly marked by his partialities and prejudices, its somewhat quaint and grotesque character, its admixture of superstition, learning, and ingenuity, make it still interesting. In 1713 his 'Curiosa Americana' was read before the Royal Society of London, and he was elected a member of that body, being the first American to receive this distinction. In its 'Transactions' in 1721 appeared an account of the practice of inoculation for the smallpox, recently introduced by Lady Mary Wortley Montagu; and it was by the efforts of Mather in connection with Dr.

MATHER — MATHESON

Boylston, against both professional and popular prejudice, that the operation was first performed in Boston. His 'Essays to Do Good' (1710) was admitted by Dr. Franklin to have influenced some of the principal events of his life; and his 'Christian Philosopher' and 'Directions for a Candidate of the Ministry' enjoyed high repute. His 'Parentator' (1724) is a life of his father, Increase. Vain and pedantic as he was and narrow and credulous as he showed himself to be in regard to witchcraft and other topics of his time, he was in many directions a useful, public-spirited citizen who deserves to be regarded more leniently by posterity than has sometimes been the case. Consult: 'Life' by Samuel Mather (1729); Pond, 'The Mather Family' (1844); Marvin, 'Life and Times of Cotton Mather' (1892); Wendell, 'Cotton Mather' (1891); Tyler, 'History of American Literature' (1881).

Mather, Increase, American colonial divine son of Richard Mather (q.v.): b. Dorchester, Mass., 21 Jan. 1639; d. Boston 23 Aug. 1723. He was graduated at Harvard College in 1656, and in 1658 at Trinity College, Dublin. He afterward preached in Devonshire and the island of Guernsey, and on the Restoration was urged to conform and settle in England; but he refused, and on his return to Boston was invited to preach to the North Church, of which he was ordained pastor in 1664. This office he held for 62 years. He was a member of the synod of 1679, and drew up the propositions which were adopted concerning the proper subjects of baptism. In 1681 he was elected president of Harvard College, but the reluctance of his church to relinquish him induced him to decline the position. In 1684 the office was again offered him, and he accepted it with a stipulation that he should retain his relation to his people. He continued in this station till 1701, when he retired in consequence of an act of the general court requiring the president to reside in Cambridge. He received the first diploma for the degree of D.D. that was granted in America. When in 1683 Charles II. demanded that the charter of Massachusetts should be resigned into his hands, Mather was foremost in opposing the measure; and when that monarch annulled the charter in 1685, he was sent to England as agent for the colonies. He was in England during the revolution of 1688, and, having found it impossible to obtain a restoration of the old charter, accepted a new one, under which the appointment to all the offices reserved to the crown was confided to him. He returned in 1692, when the general court appointed a day of thanksgiving for his safety and for the settlement of the dispute. He is stated to have condemned the violent proceedings which followed relating to witchcraft. He was accustomed to spend 16 hours every day in his study, and always committed his sermons to memory. One tenth part of all his income was devoted to purposes of charity. He was the author of 92 distinct publications. His 'Remarkable Providences' was republished in the 'Library of Old Authors' (1856), and other works by him are: 'Cometographia, or a Discourse Concerning Comets' (1683); 'Cases of Conscience Concerning Witchcraft' (1693). Consult: Pond, 'The Mather Family' (1844); Walker, 'Ten New England Leaders' (1901).

Mather, James Marshall, English nonconformist clergyman and author: b. Darlington 1851. He studied architecture in Lincoln and later prepared for and entered the nonconformist ministry. He has published: 'Life and Teachings of John Ruskin,' which has passed through nine editions; 'Popular Studies in 19th Century Poets'; 'Lancashire Idylls'; 'The Sign of the Wooden Shoon'; 'By Roaring Loom'; etc.

Mather, Richard, American colonial divine: b. Lowton, Lancashire, England, 1596; d. Dorchester, Mass., 22 April 1669. He became a schoolmaster at Toxteth Park, near Liverpool, at the age of 15; studied at Brazenose College, Oxford, in 1618; was ordained in the English Church soon after, and became the minister of Toxteth, in which position he remained 15 years. He was suspended for non-conformity to the ceremonies of the Established Church in 1633, and though soon restored by the influence of friends was again silenced in the following year. He therefore decided to emigrate to New England, arriving in Boston in August 1635. The next year he became pastor of the church in Dorchester, and held that position till his death. He was one of the compilers of the 'Bay Psalm Book,' and assisted to frame in 1648 a model of discipline known as the Cambridge Platform. He married for his second wife the widow of John Cotton (q.v.). His 'Journal, Life and Death' was issued by the Dorchester Historical Society in 1850. Consult: Increase Mather, 'Life and Death of Richard Mather' (1670); Tyler, 'History of American Literature,' Vol. II. (1881).

Mather, William Williams, American geologist: b. Brooklyn, Conn., 24 May 1804; d. Columbus, Ohio, 26 Feb. 1859. He was graduated from West Point in 1828 and was an assistant professor of chemistry and geology there, 1829-35. After a short period spent as professor of chemistry at the University of Louisiana (1836), he undertook the superintendence of a geological survey of the 1st district of New York State which included the Hudson River counties, a labor which lasted from 1836 to 1844. He was also state geologist of Ohio 1837-40, and of Kentucky 1838-9, and from 1842-5, and 1847-50, professor of natural science in the Ohio University at Athens. He contributed frequently to scientific journals, edited the 'Western Agriculturist' for a time and published 'Geology of the 1st Geological District' in 'Natural History of New York' (1843).

Mathers, math'ërz, Helen. See REEVES, HELEN MATHERS.

Matheson, mäh'të-sôn, George, Scottish Presbyterian clergyman: b. Glasgow 27 March 1842. He was educated at Glasgow University and although he had lost his sight he entered the ministry of the Kirk of Scotland and was ordained in 1868. He was in charge of St. Bernard's Church, Edinburgh, 1886-95. Among his many published books are: 'Aids to the Study of German Theology' (1874); 'Natural Elements of Revealed Theology' (1881); 'The Psalmist and the Scientist' (1887); 'Sidelights from Patmos' (1897); 'The Sceptre Without a Sword' (1901); 'The Representative Men of the Bible' (1902).

MATHEW — MATINS

Mathew, mǎth'ū, Frank, English novelist: b. Bombay 1865. He was educated at London University and became a solicitor in 1889. He has published: 'Father Mathew: his Life and Times' (1890); 'At the Rising of the Moon: Irish Stories and Studies' (1893); 'The Wood of the Brambles' (1896); 'The Spanish Wine' (1898); 'The Royal Sisters' (1901).

Mathew, Theobald, known as "FATHER MATHEW," Irish temperance reformer: b. Thomastown Castle, County Tipperary, Ireland, 10 Oct. 1790; d. Queenstown, Ireland, 8 Dec. 1856. He was educated at Maynooth College and ordained to the Roman Catholic priesthood in 1814. In 1838 he inaugurated a temperance crusade and his labors in Great Britain and Ireland induced hundreds of thousands to sign the total abstinence pledge. The most conclusive evidence of the benefit of his preaching was the reduction of nearly £600,000 on the duties of spirits imported in Ireland in five years. He made a tour of the United States in 1849-51 and was very successful. Though pensioned by the queen he was never entirely relieved from the burden of debt with which his extended tours had burdened him, and which caused his imprisonment for a time in 1847. Consult, 'Life' by Maquire (1863); F. Mathew, 'Father Mathew: his Life and Times' (1890).

Mathews, mǎth'ūz, Albert, "PAUL SIEGVOLK," American lawyer and author: b. New York 8 Sept. 1820; d. there October 1903. He was graduated from Yale in 1842 and after studying law was admitted to the New York bar in 1845. He soon acquired an extensive practice and was especially skilled in chancery practice. He found time for literary work despite the claims of his profession, and under the pseudonym, "Paul Siegvolk," published: 'Walter Ashwood,' a once popular love story (1860); 'A Bundle of Papers' (1879); 'Thoughts on Codification of the Common Law' (1881); 'Ruminations: The Ideal American Lady and Other Essays' (1892); 'A Few Verses' (1893); etc. In the early part of his career he was a close friend of N. P. Willis (q.v.), whom he aided in establishing 'The Home Journal.'

Mathews, Charles, English actor: b. London 28 June 1776; d. Plymouth, England, 28 June 1835. He made his début as an actor in Richmond in 1793 and was subsequently engaged for some years in Dublin and London. In 1818 he made a hit as a professional entertainer in his 'At Home.' He continued in this class of work, making two successful trips to the United States and returning, presented in England with great success 'A Trip to America.'

Mathews, Charles James, English actor: b. Liverpool 26 Dec. 1803; d. Manchester, England, 24 June 1878. He was the son of Charles Mathews (q.v.) and was educated as an architect, but abandoned that calling for the stage. As a light comedian he was very successful, but his attempts at managing Covent Garden and the Lyceum Theatre in London were failures. He made several trips to the United States, Paris and Australia, presenting an entertainment similar to his father's famous 'At Home.'

Mathews, Ferdinand Schuyler, American artist and author: b. New Brighton, N. Y., 30 May 1854. He was educated at Cooper Institute, studied art in Italy and has made a spe-

cialty of decorative designing. He has contributed extensively to the magazines both as illustrator and writer, in the latter field dealing chiefly with subjects which come within his own profession. He has published: 'The Writing Table of the 20th Century' (1900); 'The Field-Book of American Wild Flowers' (1902); etc.

Mathews, Shailer, American educator: b. Portland, Maine, 26 May 1863. He was graduated from Newton Theological Institution in 1887 and studied in Berlin. In 1887 he was appointed assistant professor of rhetoric at Colby University, and in 1889 accepted the chair of history and political economy, which he occupied until 1894, when he was made junior dean of the Divinity school in the University of Chicago and professor of New Testament history. He has published: 'Select Mediæval Documents' (1891-1900); 'The Social Teaching of Jesus' (1897); 'A History of New Testament Times in Palestine' (1899); 'The French Revolution: a Sketch' (1901); 'Principles and Ideals for the Sunday School' (1903); etc.

Mathews, William, American author: b. Waterville, Maine, 28 July 1818. He studied law at Harvard and was admitted to the bar in 1838, practising for a time in Waterville, but soon abandoned law for journalism. In 1862 he was appointed professor of English and rhetoric at the University of Chicago, but in 1875 resigned in order to devote himself exclusively to literature. Among his many books are: 'Getting on in the World' (1873); 'The Great Conversers' (1874); 'Oratory and Orators' (1879); 'Men, Places and Things' (1888); 'Nugæ Literariæ' (1896); etc.

Mathews, William Smythe Babcock, American musical writer and editor: b. Loudon, N. H., 8 May 1837. He obtained his musical education in Boston and became a teacher in 1853; he was for a time engaged at the Wesleyan Female Seminary in Georgia, but in 1867 he removed to Chicago, where he has been prominent as an organist and engaged in editorial work and criticism of music on the leading Chicago papers. In 1891 he established the magazine 'Music,' and edited it until 1903, when it became a part of the 'Philharmonic.' He is the author of: 'How to Understand Music' (1880-8); 'Music and Its Ideals' (1897); 'Dictionary of Musical Terms' (1895); 'Popular History of Music' (1901); 'The Great in Music' (1900-03); etc.

Matin, a large hound-like French dog, resembling the great Dane, but having a rough coat. The head is elongated, the forehead flat, the ears pendulous toward the tips; color, yellowish-fawn or whitish. It is commonly employed in France as a sheep-dog and watchdog.

Matins, the daily office of Morning Prayer in the Anglican communion. It is composed in part of the pre-Reformation offices of Matins and Lauds. In the Roman Catholic Church, the first portion of the Divine Office, with which Lauds are usually associated. On Sundays and double feasts matins have three nocturns; on simple feasts and week-days, one nocturn. Easter and Pentecost have each only one nocturn, with three psalms. After private prayer versicles and responses are recited; the invitatory psalm follows. In the first nocturn are said three psalms on feast days, 12 when the

office is of the Sunday, and three lessons from Scripture; the second and third nocturns have each three psalms, and the lessons are chosen from the patristic writings for the second, and from some commentary on the Gospel of the day for the third nocturn. On feasts of saints the lections of the second nocturn are usually biographical. Lauds consist of five psalms, the little chapter, a hymn, the canticle *Benedictus*, collect, and commemorations, if any.

Matriar'chate, position or power of a matriarch, a name formerly given to the wife of a patriarch. Among the Indians the mother is considered of superior importance in families, clans, or tribes. Job's wife, Xantippe, and others in history have been called matriarchs. In certain primitive tribes the mother, in line of descent and inheritance, takes precedence of the father, and government by mother or mothers was not unknown.

Mat'rimony Vine. See LYCIUM.

Matsukata, Masayoshi, mā-si-ō'shē mat-soo-kā'tā, COUNT, Japanese statesman: b. Satsuma 1835. He was son of a samurai, but fell in with the Radical party; was made head of the prefecture (or *ken*) of Hida after the revolution; was prominent in the tax reform of 1875; represented Japan in several industrial exhibitions; was a member of the Cabinet, in 1880 as minister of commerce, in 1881 as minister of finance, and, with the same portfolio, as prime minister from 1891 to 1893. His great work was in 1896-7, when he formed a new cabinet, carried through the gold standard, set Japanese credit on its feet, but he was forced to retire because of the ill-success of his scheme of taxation.

Matsys, māt-sīs', or Massys, Quentin, Flemish painter: b. Antwerp about 1460; d. there between 13 July and 16 Sept. 1530. A blacksmith until he was 20, legend says that he turned artist to win the love of a painter's daughter. He was acquainted with many of the notables of the day, including Dürer, Erasmus, and Sir Thomas More. Much of his present fame is due to genre pictures, especially of misers and money-changers, which are not his work, but that of his school, among them his son Jan, whose 'Misers' is at Windsor Castle. Matsys' own work is styled a connecting link between Van Eyck and the later Dutch realists; apart from such excellent portraits as those of Maximilian of Austria and Petrus Aegidius, it is mostly religious in theme. The 'Burial of Christ,' an altarpiece for the Antwerp Cathedral, now in the Antwerp Museum, and the 'Story of St. Anne,' now in the Brussels Gallery, are the best examples of his work.

Mat'tawa, a river in Canada, the source of which is Trout Lake, east of Lake Nipissing. It flows east a distance of about 50 miles and enters the Ottawa River at Mattawa. This river forms part of an almost continuous waterway from the Ottawa River to Lake Huron, and before the Canadian Pacific railroad was built this water route was much used for transportation and travel.

Matteawan, māt-te-a-wōn', N. Y., village, in Dutchess County; on Fishkill Creek, and on the New York, N. H. & H., and the Newburg, D. & C. R.R.'s; about 45 miles north of New York and two miles east of the Hudson River. The first permanent settlement was made in

1804; but there had been trading posts in the vicinity in the 18th century. Matteawan is in an agricultural region, and has considerable trade in fruit, potatoes, and dairy products. The industrial establishments are hat factories, novelty works, machine-shops, silk mills, coal and lumber yards. The prominent buildings are the State Hospital for the Criminal Insane, New Hospital, Highland Hospital, and the Howland Circulating Library. Pop. (1900) 5,807.

Mattei, māt-tā'ē, Tito, Italian musician and composer: b. Campobasso, Italy, 24 May 1841. He was educated in Naples. He was accorded the degree of professor in Saint Cecilia's Academy at Rome when he was 11 and was also elected a member of the Philharmonic Society in Florence and other cities. He gave his first concert when 15 and afterward made tours of Europe, but in 1863 settled in London and confined his concert tours to Great Britain, and in 1870 he conducted an Italian opera at the Lyceum theatre. He is the composer of hundreds of songs and pianoforte pieces, many of which have become widely popular, and the operas: 'Maria di Gand'; 'La Prima Donna'; etc.

Matter, in physics, mechanics and chemistry, the tangible substance of which the world external to our minds is composed, and which is characterized by the resistance which it opposes to muscular efforts exerted upon it. Since we can know it only through the mediation of our senses, its actual objective reality has often been questioned by philosophers and metaphysicians; and in order to avoid doubtful points of this sort it is frequently defined merely as a "physical concept," without making any hypothesis as to its objective existence. (Consult Pearson, 'The Grammar of Science.')

In physics and chemistry we think and speak of it as having a real existence, however, just as we do in common life. For scientific purposes it is highly important to be able to accurately compare the quantities of matter in two bodies; but the phrase "quantity of matter" is not commonly used in science, the word "mass" (or inertia) being substituted for it. The term "mass" is synonymous with "quantity of matter" so long as the bodies compared are identical in composition and in physical state; but by its use we avoid the uncertainty in the meaning of the longer phrase, when it is applied to bodies of dissimilar composition. Two bodies are said to have "equal masses" under the following conditions: Let the two bodies be conceived to be initially at rest, and free from the action of any external forces whatsoever. Let them then be exposed to the action of equal forces for an equal length of time. If, under these circumstances, the velocities that are produced in the two bodies are equal, the masses of the bodies are also equal, by definition. But if the velocities that are produced are unequal, then the masses are also unequal, and are (by definition) proportional to these velocities; the body which is moving the faster being the one whose mass is the less. It would be impossible to carry out an elaborate experiment of this kind every time we wished to compare the masses of a pair of bodies, and it fortunately happens that masses can be compared with great accuracy by merely weighing the bodies against each other in a balance. For equality of weight means that the earth's attractive force is the same upon both; and if (as we

MATTER

know to be the case, by experiment,) the two bodies would fall with the same speed in a vacuum, it follows that equal forces acting upon the two bodies for equal times communicate to them equal velocities; and hence, by the definition of "mass," the masses of the two bodies are equal. It will be noted that mass and weight are two essentially different things, although they are very commonly confused, because they are strictly proportional to each other, according to the most accurate experiments that have yet been made. Yet it is not at all impossible to imagine a state of things in which mass and weight would not be strictly proportional. It is only by experiment, for example, that we know that the earth attracts a body with precisely the same force, whether the body is hot or cold. The attraction between two permanent magnets varies with the temperature, and it may yet be found that gravitative attraction varies in the same way, though to a much smaller extent. Numerous experimenters have in fact fancied that they could detect an effect of this kind, though its reality is not yet admitted. But we can hardly admit that the mass of a body is a function of the temperature; and so we see that the apparently strict proportionality between mass and weight is not at all a necessity of thought, but merely an experimental fact, which may any day be shown to be nothing but a close approximation to the actual truth.

So far as we know, matter can neither be destroyed nor created by any experimental means at our command, nor by any process now operative in nature. This great fact is often called the "law of the conservation of matter," and it appears to be rigorously true. As has been pointed out above, future experiment may show that the weight of a body depends to a slight extent upon its temperature, and it may also be found that the weight of a chemical compound is not always precisely equal to the sum of the weights of its constituents; but it is believed that any irregularities of this sort that may be discovered will hold true of the weight only, and will not affect the mass; and that the weight will also return to its original value when the substance that is weighed is brought back to the same chemical and physical condition again. The gravitative action of matter is one of its most singular attributes, and one which we are still far from understanding. It is apparently true that every particle of matter attracts every other particle with a force which is directly proportional to the product of the masses of the two particles, and inversely proportional to the square of the distance between them, and independent of every other circumstance. It is not certain that this law holds true, nor that the attraction exists at all, at distances comparable with the distance from the earth to the fixed stars, but it appears to hold rigorously at distances commensurate with the dimensions of the solar system. Electric and magnetic forces may be either attractive or repulsive; but gravitative action is probably always attractive, the only phenomena which would countenance the opposite view being the apparent repulsion that the sun exerts upon the tails of comets, and upon the coronal streamers that are seen at the time of a total solar eclipse.

Matter exists in three (or perhaps four) physical states. All ordinary bodies, for example, may be classified, roughly, either as solids

or fluids; fluids being further subdivided into liquids and gases. This classification is not all that could be desired, since there are certain bodies (such as wax) which have certain characteristics of the solids, and certain others of the liquids. A more complete and systematic classification is hardly practicable, however, in the present article. A solid body may be defined as a body capable of resisting a considerable shearing stress. (See ELASTICITY.) Solid bodies usually have a considerable tensile strength also. A solid does not yield continuously to a small deforming force; it resists deformation, and its resistance increases as the deformation increases. A fluid, on the other hand, is a substance having almost no shearing strength, and offering very little resistance to forces that tend to change its shape. A fluid yields continuously to a deforming force, and a force that will deform it at all will deform it indefinitely, so long as it is allowed to act. Considering the subdivision of fluids into gases and liquids, we may say that a gas is a fluid that presses continuously and in every direction upon the walls of the vessel containing it, and which follows them indefinitely if they retreat. A gas, if left to itself, tends to expand infinitely in all directions. A liquid is a fluid which does not follow the walls of the containing vessel if they retreat, and which has no tendency to expand indefinitely if left to itself. (For the prevalent theories regarding the constitution of matter, see GASES, KINETIC THEORY OF; MOLECULAR THEORY.)

When a gas is rarefied very highly by a mercury vacuum pump, it exhibits properties which are different in many respects from those manifested by gases in the ordinary state of density. The pressure in such a rarefied gas, for example, may be different in different directions; so that in this respect, at least, the rarefied medium resembles a solid rather than a gas or liquid. Mechanical and electrical properties are also observed at high exhaustions which cannot be reproduced at ordinary pressures; and for these and other reasons Crookes considered that a gas, when under only (say) the millionth or ten millionth of an atmosphere of pressure, may be fairly said to constitute a "fourth state of matter," which he considered to be as different from the gaseous state as the gaseous state is from the liquid state. At first thought this appears to be an extreme and hardly a justifiable view; but it must be remembered that Andrews showed that the distinction between a liquid and the gas or vapor obtained from it by evaporation ceases to exist at temperatures higher than a certain critical value peculiar to each substance. (See CRITICAL POINT.) This temperature is about 88° F. for carbon dioxide, and at temperatures progressively higher than this the isothermals of carbon dioxide approximate with increasing closeness to the hyperbolas of a perfect gas. It might be thought that a critical state exists with reference to the solid and liquid states; but this is still somewhat doubtful. It appears probable that no such state exists between a solid and its liquid, unless the solid is crystalline; and its existence has not been established even for this case.

See MOLECULAR THEORY; GASES, GENERAL PROPERTIES OF; ELECTRON; SOLUTION; ETHER; VACUUM; etc. Consult, also, Tait, 'Properties of Matter'; Kimball, 'Physical Properties of Gases'; Poynting and Thomson, 'Properties of

MATTERHORN — MATTING

Matter'; Risteen, 'Molecules and the Molecular Theory of Matter'; Lehmann, 'Molekularphysik.'

Matterhorn, măt'tēr-hörn, Mount. See CERVIN, MONT.

Matteson, măt'č-són, **Tompkins Harrison**, American artist: b. Poughkeepsie, N. Y., 9 May 1813; d. Sherbourne, N. Y., 2 Feb. 1884. His early lessons in art were from an Indian; otherwise he was mostly self-taught until after the success of his 'Spirit of '76,' when he settled in New York and studied in the National Academy. From 1851 until his death his home was Sherbourne. For a time he was a member of the New York legislature. His themes were historical or from American country life, and his best known pictures are 'The First Sabbath of the Pilgrims,' 'Examination of a Witch,' 'Eliot Preaching to the Indians,' 'Rip Van Winkle's Return from the Mountains,' 'At the Stile,' and 'Foddering Cattle.'

Matthew, Gospel of. See GOSPELS.

Matthew Town. See INAGUA, GREAT.

Matthews, măt'h'uz (James) **Brander**, American author: b. New Orleans, La., 21 Feb. 1852. Graduated from Columbia in 1871, and from the Columbia Law School in 1873, he was admitted to the New York bar (1873), began to contribute to the magazines in 1873, later turned wholly to literature, and in 1892 was appointed professor of literature in Columbia. In 1898 he became professor of dramatic literature. He was a founder of The Players and Authors clubs, of the Dunlap Society and the American Copyright League, and of the Columbia University Press. In 1889-91 he was president of the Nineteenth Century Club. He wrote several dramatic works, among them 'This Picture and That'; 'A Gold Mine' (with G. H. Jessop); 'On Probation' (also with Jessop); and 'Peter Stuyvesant' (with Bronson Howard). His published volumes include, from an extensive list, the following: 'French Dramatists of the Nineteenth Century' (1881); 'In Partnership' (with H. C. Bunner; 1884); 'A Secret of the Sea, and Other Stories' (1886); 'Pen and Ink' (1888); 'American Literature' (1896); 'Outlines in Local Color' (1897); 'A Confident To-morrow' (1898); 'The Action and the Word' (1900); 'The Historical Novel, and other Essays' (1901); 'Parts of Speech: Essays in English' (1901); 'The Development of the Drama' (1902). He is perhaps best known for his critical papers, marked by keen analysis and a style of much distinction. Some of his earlier writings appeared over the signature "Arthur Penn."

Matthews, **Edmund Orville**, American naval officer: b. Baltimore 24 Oct. 1836. He was graduated from the United States Naval Academy in 1855 and served in the navy with several promotions before the outbreak of the Civil War, in which he served with distinction. In 1869-73 he was in command of the torpedo boat corps at Goat Island, Newport Harbor, and he commanded the Brooklyn in the Asiatic squadron in 1885-7; he was a member of the board of inspection and survey in 1891-4, and in 1897 was raised to the rank of rear-admiral. He was appointed president of the examining board in 1898 and served until he was retired in that year.

Matthews, **Franklin**, American journalist: b. St. Joseph, Mich., 14 May 1858. He was graduated from Cornell University in 1883, was reporter and editor on the Philadelphia Press 1886-90, and since the last named year has been editor of the New York Sun. He has published 'Our Navy in Time of War' (1899); 'The New-born Cuba' (1899).

Matthews, **Stanley**, American jurist: b. Cincinnati, Ohio, 21 July 1824; d. Washington, D. C., 22 March 1889. He was graduated from Kenyon College in 1840, studied law and was admitted to the bar in 1842, when he established a practice in Maury County, Tennessee, but returned to Cincinnati in 1844 and engaged in practice there. He was editor of the Cincinnati Herald, an anti-slavery journal in 1846-9, and held various political offices, and in 1855-6 was a State senator. In 1858 he was appointed United States district-attorney for the southern district of Ohio, but at the outbreak of the Civil War in 1861 entered the volunteer service and was commissioned lieutenant-colonel and was a colonel when in 1863 he resigned to accept the seat of judge of the superior court of Cincinnati. He was elected United States Senator in 1877 after having acted as counsel before the electoral commission, and in 1881 he was appointed a justice of the Supreme Court of the United States.

Matthias, ma-thi'as, a disciple of Jesus, probably one of the 70, who was chosen by lot to take Judas Iscariot's place among the 12. Little is known of him. Even early legend confused him with Matthew, and an apocryphal gospel was attributed to him. In the Roman Catholic Church 24 February, in the Greek 9 August, is sacred to him. The 'Acts of Andrew and Matthias' make him a missionary in Africa.

Matthias (Ger. măt-tē'äs), emperor of Germany: b. Vienna 24 Feb. 1557; d. 20 March 1619. He was a younger son of Maximilian II. (q.v.). In 1612-19 he was emperor of the Holy Roman Empire, having been elected on the death of his brother Rudolf II. (q.v.) His reign was an unsuccessful one. He attempted in vain to suppress by decree the Catholic League and Protestant Union. In 1628 the Thirty Years' war began.

Matthias Corvinus, kôr-vē'noos, THE GREAT, king of Hungary: b. Klausenburg, Transylvania, 27 March 1443; d. Vienna 6 April 1490. The second son of John Hunyady, he was imprisoned in Bohemia by his father's enemies, who strongly but unsuccessfully opposed his candidacy for the crown of Hungary in 1458. Another party of opposition attempted to make the Emperor Frederick III. king of Hungary; but Matthias brought them to terms and in 1463 made peace with Frederick. By the Peace of Olmütz, 22 July 1479, he gained Silesia, Moravia, and Lausitz, and the succession to the crown of Bohemia. In his wars with the Turks he was equally successful and a part of Bosnia was ceded to him by the Porte. War broke out again with the Austrian emperor; Matthias invaded his territory and captured and held Vienna. His court was a centre of scholarly men and his library, called the Corvina, a famous collection. The internal administration of Hungary was greatly improved under Matthias.

Mat'ing. While this term is usually employed to designate floor coverings made from

MATting FIBRES—MATTO-GROSSO

reeds and fibrous grasses, it is a generic term which includes not only the commercial mattings for house floors, which are made in Eastern countries, but a much wider range of articles useful in the domestic economy, and in other employments, such as screens and tatties, sleeping mats (used in India and the East), the matting employed by nurserymen for protecting hotbeds and cold frames, and even some forms of thatch. For the most part mattings are hand-woven, in the finer varieties the warp being cotton or other yarns, and the filling the culms of various sedges, reeds and grasses, an example being the familiar Japanese mattings of the house-furnishing stores. In the Russian bast (q.v.) mattings for nurserymen's use, bast of the linden tree is employed for both warp and filling, very coarsely woven or plaited. The roots of the Khus-Khus (*Andropogon squarrosus*), a perennial grass of India, are woven into fragrant screens for open windows, and also made into awnings. The Taika rush mats of Lormosa are famous as sleeping mats, and the best grades are said to be as fine and soft as cloth, resembling the best Panama hat weaving. Consul Davidson states that a mat of the highest grade, measuring 5 x 6 feet, requires the labor of a girl weaver 120 days, and such mats have sold for 60 to 70 yen (or about \$40). The rush is an unidentified species, but sleeping mats are made from several species of *Cyperus* and *Scirpus* found in Asia, Africa and other countries.

The commercial mattings used for house decoration are for the most part of Chinese and Japanese manufacture. In Japan two species are employed, *Juncus effusus*, the Bingo-i mat rush, which is always manufactured into the costly mats used by the higher classes (and known as Tatamiomote), and *Cyperus unitans*, which is employed for the cheaper grades. The largest importer of these mats is the United States, England, Austria, and Germany, following in the order named. The qualities of the Bingo-i are named as follows: Kinkwanyen, manufactured at Okayama; first quality Aya-mushiro, second quality Aya-mushiro, Damask Aya-mushiro, common Aya-mushiro, manufactured at Bittiro. First quality Somewake-mushiro, common Somewake-mushiro, Damask Hana-mushiro, common Hana-mushiro, manufactured at Bingo; ordinary Hana-mushiro (best quality), manufactured at Chikugo. *Cyperus unitans* produces the Shichito-i mats which are chiefly manufactured in the Oita prefecture. The plant is cultivated both upon upland and irrigated lands. The varieties of mats from this species are known by names as follows: Kikai-ori Hana-mushiro, Damask Hana-mushiro, common Hana-mushiro (two forms), Seidaka Hana-mushiro, manufactured at Bungo. Mattings made from the two species above have been exported in a single year to the value of 650,000 yen, or over \$400,000.

The Chinese and Korean mat rush is *Cyperus tegetiformis*, this species also being used for the manufacture of cuffs and sandals. The India commercial mattings are made chiefly from *Cyperus corymbosus* and *tegetum*; the latter being known as the Calcutta mat rush, while the former is used for the Tinnerly mats which are the finest made in India. They are also made at Palghat, but these are not so fine. In the manufacture of the India mattings the culms are split into two or three parts and then woven into mats

upon a warp of threads previously stretched across the floor of a room. The operator passes the culms with the hand alternately over and under the successive threads of the warp, and presses them home.

It would be difficult to enumerate all of the mattings made in different countries, though mention should be made of the fine and highly prized Niihau mats of Hawaii, produced from *Cyperus levigatus*. Matting is made in Spain and Morocco from *Juncus maritimus*, and in Italy from *Juncus acutus*. Two species of sword rush, *Lepidosperma gladiatum* and *L. flexuosum*, are used by the natives of Australia not only for mats, but for baskets and other articles, and *Lepironica mucronata*, found in Asia, Africa and Polynesia, supplies the fibre for the mats with which Chinese boatmen cover their cargoes.

In the United States a handsome and utilitarian form of floor matting is largely manufactured from Slough grass, *Carex filiformis*. Fully described under Fibre (q.v.).

The University of California has recently been experimenting with several species of matting rushes, chiefly *Juncus effusus*, and *J. robustus*, from which a fine sample of matting has been manufactured at a factory in Maine. There is a possibility therefore that rush matting may be produced in the United States, commercially, in the near future.

For matting fibres see also 'Dictionary Economic Products of India,' 'Descriptive Catalogue of Useful Fiber Plants of the World,' and 'The Island of Formosa,' by Jas. W. Davidson. The leaves of many species of palm, in different parts of the world, are used for native mats and mattings, though few of these ever reach commercial importance. See PALM.

CHARLES RICHARDS DODGE.

Matting Fibres. See FIBRE.

Matto-Grosso, măt'too-grô'ssoo, Brazil, the westernmost state, bounded on the north by a range of mountains which separates it from Pará; east by the Araguaia, which separates it from Goyaz; southeast by the Parana, separating it from São Paulo; south by Paraguay; and west by Bolivia; area, 532,445 square miles. It is traversed, northwest to southeast, by a mountain chain, forming the principal watershed between the basins of the Amazon and the Rio de la Plata. From the mountains numerous streams descend through lofty rocky valleys, which gradually spread out into immense plains. The principal rivers are the Guapore, Juruena, Xingu, Araguaia, Parana with its tributary Pardo, and the Paraguay with its tributaries São Lourenço and Tacoary. The dense forests which cover a great part of the surface have given the province its name, Matto Grosso, signifying "Great Forest." They abound with inexhaustible supplies of the finest timber, and also yield many rare and valuable gums, balsams, and medicinal plants. Cacao, jalap, and maté are of spontaneous growth. Numerous wild animals infest the woods. The state is rich in minerals. There is scarcely a district in which gold has not been found, though the working of the mines has ceased to be profitable. Iron is abundant, but is unworked. Over an extensive region near the centre, diamond mines were long wrought, and at one time yielded a large revenue to the Portuguese government. In other quarters various other gems and crystals are obtained. In many

MATTOON—MAUMEE

of the valleys and plains the soil is of remarkable fertility, producing rich crops of rice, millet, mandioc, haricots, cotton, sugar, and tobacco; but the greater part of the surface remains in a state of nature. The state is represented in the chamber of deputies of the Federal government by four members, and in the Federal senate by three senators. Its internal affairs are administered by a state executive and legislature, the latter being chosen by popular vote. The capital of the state is Cuyaba. Pop. (exclusive of Indians) in 1890 92,827.

Mattoon, ma-toon', Ill., city, in Coles County; on the Illinois C., the Peoria, D. & E., and the Cleveland, C. C. & St. L. R.R.'s; about 75 miles east by south of Springfield. It was settled and incorporated in the year 1855. It is situated in an agricultural region in which broom corn is one of the principal products. The chief manufacturing establishments are broom factories, flour mills, grain elevators, wagon and carriage factories, foundries, machine-shops, and repair shops for several railroads. It has a large trade in its manufactured articles, grain, fruit, and live-stock. Some of the prominent buildings are the Old Folks' Home (I. O. O. F.), the public and parish schools, the public library and reading room, and the churches. The electric-light plant is owned and operated by the city. Pop. (1890) 6,833; (1900) 9,622.

Maturin, mā-too-rēn', Venezuela, a town in the state of Bermudez, formerly the capital of the state of Maturin, now united with Bermudez. It is on the Guarapiche branch of the Orinoco delta, 25 miles by rail above its port Colorado, and 40 miles from the sea. A considerable trade with the West Indies, principally in cattle and hides, is carried on. In the neighborhood are extensive plantations of cacao. Pop. (1891) 14,473.

Matzoon', a milk food used in Armenia; prepared by exposing milk in open vessels to a heat of 90° F., and when coagulation takes place the curd is broken up by a churning process, and a little salt is added.

Mat'zoth, the Hebrew name for a kind of unleavened bread or biscuit eaten by the Jews during the feast of the Passover.

Mauch Chunk, māk chūnk, Pa., a town and county-seat of Carbon County, on the Lehigh River, the Lehigh Coal and Navigation Company's Canal, and on the Central of N. J., and the Lehigh V. R.R.'s; 46 miles west by north of Easton. The town is picturesquely built on the side of a mountain rising 1,500 feet from the river, here winding through a narrow, deep ravine, and each summer is visited by thousands of tourists, attracted by the beauty of the surrounding natural scenery. The town has a county building, Y. M. C. A. building, the Dimmick Memorial Library, is electrically lighted, and has electric street railways. It has a number of foundries, shoe factory, car shops, etc., but is best known as an important coal centre, marking the extreme boundary of the anthracite coal region of Pennsylvania; it was established by the Lehigh Coal and Navigation Company in 1818. The Summit Hill coal mines, nine miles southwest of the town, are among the best in the State. The coal is now carried through a tunnel, but was formerly transported to Mauch Chunk by a gravity railroad known as the Switchback, which has become famous as an ex-

citing pleasure route for tourists. Mounts Pisgah and Jefferson, the summits of which are reached by the Switchback railroad; Prospect Rock, Flagstaff Peak, and Glen Onoko are points of considerable interest, commanding splendid views of the Lehigh Valley. Pop. (1900) 4,029.

Maud Mul'ler, a poem by J. G. Whittier, first published in the 'National Era,' December 1854. It is a ballad reciting a romantic passage in the lives of a susceptible judge and a country girl.

Maudsley, mādz'li, Henry, English alienist: b. Giggleswick, Yorkshire, 6 Feb. 1835. He was graduated in medicine from the University of London in 1857, was editor of the 'Journal of Mental Science' in 1863-78, in 1869-70 was professor of medical jurisprudence in University College, London, and in 1869 became a fellow of the Royal College of Physicians. A list of his works includes: 'Physiology and Pathology of the Mind' (1867); 'Lectures on Body and Mind' (1870); 'Responsibility in Mental Disease' (1874); 'The Physiology of Mind' (1883); 'Natural Causes and Supernatural Seemings' (1886).

Maule, mow'lā, Chile, a maritime province bounded north by the province of Talca, east by Linares and Nuble, south by Concepcion, and west by the Pacific Ocean. Area, 2,930 square miles. It takes its name from its principal river. The well wooded Coast Range, nearly 3,000 feet high, occupies the great portion of the surface. Agriculture and its allied occupations constitute the principal industries. Capital Caquenes; chief port Constitucion. Pop. of province (1895) 119,791.

Maule, Chile, a river rising in the Andes and after a westerly course of about 150 miles, 52 of which are navigable for small vessels, flowing into the Pacific Ocean near the village of Constitucion, 99 miles northeast of Concepcion.

Maulmain, māl-mān', or **Moulmein**, mowl-min', Burma, the capital of the Tenasserim division, and a seaport near the mouth of the Salwin River, on the Gulf of Martaban. The town, comparatively modern, dating from 1826, is regularly built on level ground between the river and a range of wooded hills, on whose heights are the gilded spires of numerous pagodas and elegant residences, commanding fine views of beautiful scenery. Maulmain has numerous public buildings, churches, chapels, and missionary establishments, several charitable and educational institutions, barracks, a hospital, jail, etc. A considerable trade is carried on with Indian ports, the chief exports being teak-wood and rice, the imports, piece goods, hardware, provisions and general merchandise. Pop. (1901) 58,446, besides native Burmese, comprising Hindus, Eurasians, Armenians, Chinese, Malays, Jews, and Europeans.

Maumee, mā-mē', a river formed by the junction of Saint Mary's and Saint Joseph's rivers at Fort Wayne, Ind. It flows northeast across the northwest corner of the State of Ohio, and enters Lake Erie through Maumee Bay. The river is 150 miles long and navigable 12 miles from its mouth to the Maumee Rapids. The Miami and Erie Canal, which connects Lake Erie with the Ohio River, begins at the head of navigation on the Maumee, and follows the

MAUNA KEA—MAURICE

course of the river to Defiance, then turns south. The Maumee Bay, a shallow body of water, has been improved by deepening and straightening the channel. Toledo is at the mouth of the Maumee. The Maumee River was a part of one of the water routes much used by the early missionaries and explorers. The distance from the head waters of the Maumee to the Wabash River is only about 25 miles.

Mauna Kea, mow'nā kā'ā, Hawaii, an extinct volcano, the highest peak in the Pacific, 13,805 feet in altitude. See HAWAII.

Mauna Loa, mow'nā lō'ā, Hawaii, a volcano 13,760 feet high, with a crater nearly five miles in circumference, and vertical precipices on the inner side 500 to 600 feet high. Mauna Loa is situated in the central southern portion of Hawaii, and on its eastern slope is the still larger crater of Kilauea, about nine miles in circumference, but apparently having no communication with Mauna Loa, their periods of activity being independent of each other. See HAWAII; KILAUEA.

Maundy (mān'dī) **Thursday** is the Thursday in the Passion week. Another popular old name of the day is Shere Thursday, from the custom of shearing the hair which the priesthood used to observe. It used to be the custom in England and other countries, and still is in Austria, for the sovereign to wash the feet of a certain number of poor persons, and to send them away with presents in the shape of food, clothing, and money. This ceremony is in commemoration of the act of Christ, who washed his apostles' feet on the occasion of the last supper.

Maupassant, Henri René Albert Guy de, ðñ-rē ré-nā āl-bār gē dē mō-pā-sān, French novelist: b. Chateau Miromesnil, Seine-Inferieure, France, 5 Aug. 1850; d. Paris 6 July 1893. He began his career as a clerk in the navy department in Paris and also served for a time in the French army during the Franco-Prussian war. The novelist Flaubert, a friend of his mother's, was his godfather, and the youth took him as his model in the art of composition. After years of practice, during which he wrote and destroyed a great number of manuscripts, he allowed a short story, 'Boule de Suif,' to appear in 1880, a work which displayed the greatest finish and at the same time allied him to the naturalistic school of fiction. In the same year he published a book of verse, 'Des Vers,' and a drama, 'Histoire du vieux Temps.' After this he continued to cultivate the short story and was very soon recognized as one of the greatest writers of short stories the 19th century had seen. In spite of the perfection of art displayed in their construction neither his brief tales nor his novels form pleasant reading. They compel admiration, but they are dominated by pessimism and in his later work the traces of an unbalanced mind may be plainly seen. In 1892 De Maupassant's mental malady occasioned the cessation of literary occupation, two years later he became wholly insane, and he died the next year in an asylum. His collections of short stories include, 'La Maison Tellier' (1881); 'Mlle. Fifi' (1883); 'Les Sœurs Rondoli' (1884); 'Yvette' (1884); 'Contes du Jour et de la Nuit' (1885); 'Contes et Nouvelles' (1885); 'La Horla' (1887); 'La petite Roque' (1888); 'La Main gauche' (1889); 'Le Père Milon'; 'L'inutile Beauté' (1890); etc. The finest of his six nov-

els is 'Pierre et Jean' (1888); the others are: 'Une Vie' (1883); 'Bel Ami' (1885); 'Mont Oriol' (1887); 'Fort comme la Mort' (1889); 'Notre Cœur' (1890). He also published several collections of travel sketches, such as 'Au Soleil' (1884); 'Sur l'Eau' (1888); 'La Vie errante' (1890). A collection of 13 of his short stories published in English with the title 'The Odd Number,' represents him at his best, both in point of art and as regards the stories themselves. The absence of a moral sense is less apparent here than elsewhere and there is less of gloom and animalism perceptible.

Maupertuis, Pierre Louis Moreau de, pē-ār loo-ē mō-rō dē mō-pēr-tü-ē, French mathematician and philosopher: b. St. Malo, France, 28 Sept. 1698; d. Basel, Switzerland, 27 July 1759. He entered the army in 1718 and after five years' service resigned in order to become instructor in mathematics in the Academy of Sciences. He went to England in 1728, where he was made a member of the Royal Society, and became a pupil of Newton. In 1736 he conducted a scientific expedition to Lapland for the purpose of measuring an arc of the meridian, the result of which was a confirmation of Newton's theory of the flattening of the globe at the poles. In 1743 he was elected to the French Academy, in 1744 was summoned to Prussia by Frederick the Great, and in 1746 was declared president of the Academy of Sciences at Berlin. A dispute with the philosopher König regarding the discovery of the infinitesimal calculus shortened his days. Among his works are: 'Sur la Figure de la Terre' (1738); 'Discours sur la Figure des Astres' (1742); 'Maupertiana ou divers Ecrits' (1753). Consult: De la Baumelle, 'Vie de Maupertuis' (1856); Damiron, 'Memoires sur Maupertuis' (1858).

Maurel, mō-rēl, **Victor**, French singer: b. Marseilles 1848. He was educated at the Paris Conservatoire and made his début in Paris in 1869. His first appearance in Royal Italian Grand Opera was in 1873 and he achieved a signal success. He created Iago in Verdi's 'Otello' and has appeared in many operatic roles in Europe and United States, being generally recognized as the leading acting baritone actor on the Italian stage.

Maurepas, Jean Frédéric, zhōñ frā-dā-rēk mō-ré-pā, **Phélypeaux**, COMTE DE, French statesman: b. Versailles 9 July 1701; d. there 21 Nov. 1781. He became minister of state under Louis XV. in 1738, but in 1749 was banished the court for an attack on Mme. Pompadour. In 1774 he was made prime-minister by Louis XVI. The chief events of his administration were the restoration of the Parliament of Paris (12 Nov. 1774), and the alliance with and assistance of the American colonies in their struggle against Great Britain. Consult Guyot, 'Eloge Historique de M. de Maurepas' (1782).

Maurice, mǎ'ris (John), **Frederic Denison**, English Anglican theologian and author, one of the leaders of the Broad Church movement: b. Normanston, Suffolk, 29 Aug. 1805; d. Cambridge 1 April 1882. He was son of a Unitarian clergyman; was educated at Trinity Hall, Cambridge; settled in London, where he was editor of the 'Athenæum' for several years; and having decided to take holy orders entered Exeter College, Oxford. In 1834 he became curate of Bubbenthal, and two years later chaplain to Guy's

MAURICE OF NASSAU—MAURITIUS

Hospital. He became professor of history in King's College, London, in 1840, and of divinity as well in 1846, but was deprived of both chairs in 1853 because of the liberal tenor of his 'Theological Essays.' Up to 1860 he was chaplain of Lincoln's Inn, and from 1860 to 1869 incumbent of St. Peter's, Vere Street, London. In 1866 he was elected professor of moral philosophy at Cambridge. During his life in London Maurice founded the Working Men's College and Queen's College (for women), took a prominent part in various practical philanthropies, and was a leader of the Christian Socialists. He was a man of wonderfully sweet and beautiful character; a fervent preacher, who made much of the fatherhood of God; and a social reformer, whose lack of success was due to the fact that he was before his time. Among Maurice's works are 'Eustace Conway,' a novel (1834); 'The Epistle to the Hebrews'; 'Warburtonian Lectures' (1846); 'The Religions of the World'; 'Boyle Lectures' (1847); 'The Lord's Prayer,' sermons (1848); 'History of Moral and Metaphysical Philosophy' (1850-60); 'Ecclesiastical History of the First and Second Centuries' (1854); 'The Word "Eternal,"' urging that "eternal punishment" is not "everlasting punishment" (1863); 'Casuistry, Moral Philosophy, and Moral Theology' (1866); 'The Conscience' (1868). Consult the 'Life, chiefly told in his own Letters,' by his son (1884); Rogers, 'Men and Movements in the English Church' (1898).

Maurice of Nassau, Prince of Orange and Count of Nassau: b. Dillenburg, Nassau, 13 Nov. 1567; d. The Hague 23 April 1625. His father, William the Silent, was assassinated in 1584, and the 18-year-old boy was chosen stadtholder by the provinces of Holland and Zealand, and later by the other provinces, the command of the army being entrusted to him in 1587 by the States-General. He captured Breda, Zutphen, and Nimeguen in 1590-1, and by 1597 had wrested the principal towns of the Netherlands from the Spanish. But Ostend was lost in 1604 and in 1609 a truce was made with Spain for 12 years. Internal dissensions followed and Olden Barneveldt, leader of the aristocratic republicans and of the party of religious tolerance, was condemned to death (1619) on the charge of high treason, but actually because of his opposition to Maurice. The stadtholder renewed the war with Spain in 1621, immediately upon the expiration of the truce, and died at the very time he was negotiating an alliance with France and with England. The greatest general of his day he was personally cold and unscrupulous.

Maurice of Saxony, DUKE AND ELECTOR OF SAXONY, German soldier: b. Freiberg 21 March 1521; d. near Sievershausen 11 July 1553. He succeeded his father, Henry the Pious, as duke of Saxony, in 1541; and although a Protestant refused to join the Schmalkald League. In 1548, two years after a secret treaty with the emperor, Maurice was made elector of Saxony. But he soon broke with the emperor, fathoming his purpose of crushing the German princes, and by a sudden show of force made Charles sign the Treaty of Passau 31 July 1552. On the 9th of July in the following year he defeated Albert of Brandenburg-Kulmbach, who had refused to accede to the Treaty of Passau, in the battle of Sievershausen, but died two days later of his wounds. Maurice was the foremost general and

diplomat of his day in Germany, but he was entirely without scruple or principle, and played off one party against another until he was little trusted by either.

Mauricius, mǎ-rîsh'f-ûs, **Flavius Tiberius**, emperor of the East 582-602 A.D.: b. Arabissus, Cappadocia, about 539 A.D.; d. Chalcedon 27 Nov. 602 A.D. He served with distinction against the Persians, and for his abilities and character was made successor to Tiberius II. by that emperor. His reign was filled with wars. He was, however, one of the greatest and best of the Eastern emperors, a patron of the arts and sciences, and himself considerably learned. Phocas, one of his generals, commanding the army operating against the Avars, led a revolt against him, and he fled to Chalcedon, where he was murdered by Phocas' order. He wrote *Στρατηγικά*, a work on military affairs, published in a Latin version by Scheffer at Upsala in 1664.

Maurists, mǎ-rîsts, the members of the Congregation of St. Maur, to whom literature owes the stately tomes known as 'Benedictine Editions.' The Congregation had its origin in a reform of the Benedictines in the early part of the 17th century; it was supported by De Retz and afterward by Richelieu, and in 1720 possessed in France six provinces, containing 180 abbeys and priories. Among the most celebrated of the Maurists are Mabillon, Martene, Montfauçon, the founder of the science of archæology, Ruinart, Lami, Le Nourri, and Martianay. Jansenism seems to have affected some of the convents, and, according to Badiche, a Masonic lodge was established at Glanfeuil in 1755, over which the prior of the monastery in that place presided. The Congregation was suppressed in 1792.

Mauritania, mǎ-rî-tā'nî-a, or **Mauretania**, Africa, the ancient name of the northwestern portion, corresponding to Morocco and western Algeria. It derived its name from its inhabitants, called by the ancients *Mauri*, a word equivalent to "Blacks." In 40 A.D. it became a Roman province. From 429 to 534 it was held by the Vandals, and in 650 it was conquered by the Arabs. See MOROCCO.

Mauritius, mǎ-rîsh'f-ûs, or **Isle of France**, an island colony of Great Britain, in the Indian Ocean, 500 miles east of Madagascar. It is of an oval form, about 40 miles in length from northeast to southwest, and 25 miles in breadth; area, 705 square miles. There are numerous capes and bays along the shore and the island is surrounded by coral reefs. It is composed chiefly of rugged and irregular mountains, rising into points of considerable height; the highest are the Montagne de la Rivière Noire, 2,730 feet, and the singular isolated rock Peter Botte, 2,700 feet. Between the mountains, and along the coast, there are large and fertile plains and valleys, having a rich soil of black vegetable mold or stiff clay, watered by numerous streamlets, many of which become periodically dry. The climate is pleasant during the cool season, but oppressively hot in summer, and the island is occasionally visited by severe epidemics of fever. The rainy season is from January to April; between December and March the island is subject to hurricanes, occasionally of extraordinary violence. When discovered in 1505 the island was almost entirely covered with wood, the greater part of which has now been cut down, although

MAURITIUS HEMP—MAUSOLEUM

some extensive forests still remain. The fauna then included the dodo, but otherwise was in no way remarkable. Some of the trees are valuable, particularly the black ebony. The indigenous vegetation includes orchids, screw-pines, the traveler's-tree, bamboo, etc. Many plants introduced from Europe, Africa, Madagascar, and India thrive well, and nearly every beautiful tropical tree or delicious fruit is met with. The principal item of cultivation is sugarcane, and to a limited extent rice, maize, manioc, vanilla, coffee, spices, fruits, and tea, the last introduced recently. The value of the exports of unrefined sugar, which is the staple, amounted in 1901 to \$8,792,784. Other exports are rum, vanilla, coconut oil, aloë-fibre, spice. The total value of exports in 1901 was \$9,286,643; of imports, \$6,780,452. The imports consist of rice, wheat, cottons, haberdashery, machinery, etc. The government is vested in a governor, an executive council, and a legislative council, the latter partly elected. The revenue for 1900 was \$3,059,985, and the expenditure \$2,856,315. The chief sources of revenue are the customs, licenses and permits, and the railways; the expenditure is chiefly on the civil service and on the railways, which have a total length of 105 miles. The currency is in rupees and cents. Schools are kept up partly by government, partly by private agencies. The highest institution is the Royal College, a school affiliated to London University. The French language and French law prevail in the colony, and the majority of the white inhabitants are of French origin. Mauritius was discovered in 1505 by the Portuguese. The Dutch took possession of it in 1598, and named it Mauritius in honor of Prince Maurice. It eventually fell into the hands of the French, from whom it was captured by the British in 1810, and it was definitely ceded to them in 1815. Principal towns, Port Louis, the capital, Curepipe, and Mahébourg. Rodrigues, Diego Garcia, the Seychelles, and some other islands of the Indian Ocean are dependencies of Mauritius. The scene of Bernardin de Saint Pierre's celebrated 'Paul et Virginie' is laid in this island. Pop. (1901) 378,195, of whom two thirds were coolies (mainly imported to work the sugar estates).

Mauritius Hemp. See FIBRE.

Mau"rocorda'tos. See MAVROCORDATOS.

Maury, mā'ri, Dabney Herndon, American military officer: b. Fredericksburg, Va., 21 May 1822; d. Peoria, Ill., 11 Jan. 1900. He was graduated from West Point in 1846 and served in the Mexican War. He was brevetted 1st lieutenant in 1847 for "gallant and meritorious conduct" at Cerro Gordo, and served in the United States Military Academy as instructor, 1847-52. At the beginning of the Civil War he was brevetted captain, but resigned to enter the Confederate army, where he attained the rank of department commander of the Army of the Gulf. He again served the United States government when under President Cleveland's first administration he was minister to Colombia. He published 'Skirmish Drill for Mounted Troops' (1859); 'Recollections of a Virginian in the Mexican, Indian and Civil Wars' (1894).

Maury, Matthew Fontaine, American naval officer and hydrographer: b. in Spottsylvania County, Va., 14 Jan. 1806; d. Lexington, Va., 1 Feb. 1873. He studied at the Harpeth

Academy in Tennessee, and entered the United States navy in 1825. During a voyage around the world in the Vincennes he began a treatise on navigation, long used as a text-book in the navy. He was made lieutenant in 1836. In 1839, when he was lamed by an accident, he quitted active sea-service for scientific work at the Naval Observatory. His powers of application were combined with rare gifts of imagination, and an elevated style. His 'Physical Geography of the Sea and Its Meteorology' (1855) has been considered a book of fascinating interest. In 1844 he published his views on the Gulf Stream, ocean currents, and great-circle sailing. His 'Wind and Current Charts' have been of immense benefit to navigation. In 1853 he reached the rank of commander, and in that year projected the maritime conference at Brussels, and also published 'Letters on the Amazon and the Atlantic Slopes of South America.' In 1861, when the Southern States seceded, he gave his services to the Confederate cause. For some time he attached himself to the fortunes of the emperor Maximilian in Mexico; but for the last few years of his life was professor of physics at the Virginia Military Institute. He was among the first to turn fresh attention to a branch of scientific inquiry which had been previously much neglected, the investigation of the depths of the sea, its currents, temperature, etc. Consult Corbin, 'Life of Matthew Fontaine Maury' (1888).

Mauser, Paul, powl mow'zër, German inventor and gun-maker: b. Oberndorf-on-the-Neckar 27 June 1838. He worked as a boy in the royal armory at Oberndorf, and there with his brother Wilhelm (b. 2 May 1834; d. 13 Jan. 1882) patented several improvements on the small arms then in use, both new needle-guns and a model replacing the "needle" powerful percussion-pin. The introduction of the Prussian needle-gun into Württemberg after the Austro-Prussian war deprived the brothers of the patronage of the government, and in 1867 he settled in Liège. Paul invented the Mauser revolver in 1879, having returned to Oberndorf in 1874. The "Mauser, 1882," was adopted by the Serbian government in 1882. After that date he made the Turkish model in 1887, the Belgian repeating rifle in 1889, the Argentine model in 1891, the Spanish model in 1893 (adopted with slight change throughout South and Central America), and in 1896 a rifle for the Swedish army. The German models of 1868 and 1871-84 are largely due to him. Typical of his rifles are the Belgian model of 1889 and the Argentine of 1891, both magazine rifles with no cut-off, but capable of single fire by replacing the top cartridge in the magazine after each discharge. The magazine holds five cartridges, lies in front of the trigger guard and under the receiver, is fixed in type but easily cleaned. The gun can be charged through the receiver with one cartridge or the five from the magazine may be stripped together from a metal clip, independently of the mechanism of the magazine and pushed to the right on the closing of the bolt. See SMALL ARMS.

Mausole'um (Greek, *mausoleion*), a tomb or burial place, the name of which is derived from Mausolus, a king of Caria, to whom a sumptuous sepulchre was raised by his wife Artemisia, at Halicarnassus. King Mausolus died 353 B.C.;

and his wife was so disconsolate that she perpetuated his memory by the erection of this magnificent monument which became so famous as to be esteemed the seventh wonder of the world, and to give a generic name to all superb sepulchres. Its entire height was 140 feet, and the entire circuit 411 feet. It was overthrown, probably by an earthquake, between the 12th and 15th centuries; and when the knights of Rhodes took possession of Halicarnassus in 1404 they availed themselves of the materials of the mausoleum to erect the fortress of San Pietro. Other famous mausoleums are that erected at Babylon by Alexander the Great in honor of Hephæstion, equally magnificent with that of Mausolus, though less refined; and the mausoleum of Augustus, built by him in the sixth consulate on the Campus Martius, between the Via Flaminia and the Tiber, the ruins of which are still seen near the church of St. Roque. One of the obelisks which stood before this superb building was found in the reign of Pope Sixtus V. This mausoleum contained the ashes of Augustus, Marcellus, Agrippa, Germanicus, and of some later emperors. The mausoleum of Hadrian at Rome is now the Castle of San Angelo.

Mauston, mäs'tôn, Wis., city, county-seat of Juneau County; on the Lemonweir River, and on the Chicago, Milwaukee & Saint Paul railroad; about 130 miles northwest of Milwaukee. The chief manufacturing establishments are lumber mills, machine shops, and flour mills. Pop. (1900) 1,718.

Mauvaises Terres, mō-vāz tēr. See BAD LANDS.

Mauve, mōv, an aniline purple coloring matter. See DYES.

Maverick, Peter, American engraver: b. New York city 22 Oct. 1780; d. there 7 June 1831. He studied engraving under his father, worked especially on bank-note designs, and made famous engravings of Charles King's portrait of Henry Clay, of Waldo's portrait of Andrew Jackson, and of Dunlap's portrait of Benjamin Moore. Maverick was one of the founders of the National Academy of Design in 1826.

Maverick, an unbranded steer, especially one appropriated by a chance finder. This term, in common use in the cattle country of the United States, is said to be derived from the name of Samuel Maverick, a Texas cattle-raiser, who, according to one story, had neglected to brand his cattle and so when they stampeded mingling with other herds, claimed all unbranded cattle in the country. Another form of the legend is that when the stock men met to register brands, Maverick shrewdly suggested that he would not brand his steers, and that they could well be distinguished as "Maverick's" by the absence of any mark; the result was that all young and stray cattle he found unbranded were appropriated by him. From this use of the word grew a wider application to anything dishonestly come by.

Ma'vis, the Scottish name for the British songthrush or throistle (q.v.), one of the favorite song-birds of western Europe.

Mavor, James, English political economist: b. Stranraer, Scotland, 8 Dec. 1854. He was graduated from the University of Glasgow. He was for a time editor of the 'Scottish Art

Review'; was university extension lecturer on political economy; in 1888 became professor of political economy at Saint Mungo's College, Glasgow, and in 1892 professor of political economy and constitutional history at the University of Toronto, Canada. He has written: 'Wages Theories and Statistics' (1888); 'Economic Theory and History Tables and Diagrams' (1890); 'Scottish Railway Strike' (1891); 'Currency Reform' (1891); 'Economic Study and Public and Private Charity' (1892); 'English Railway Rate Question' (1894); has edited 'Handbook of Canada' for 1897; and has prepared reports on 'Labor Colonies in Germany' (1893); 'Immigration into Canada from Europe' (1900), and 'Workmen's Compensation Acts' (1900). He has been interested in the currency question and has served as vice-president of the Bimetallic League.

Mavrocordatos, māv'-rō-kōr-dā'tōs, or **Maurocordatos**, Alexander, modern Greek soldier and statesman: b. Constantinople, Turkey, 15 Feb. 1791; d. Ægina 18 Aug. 1865. He was a skilful linguist and early schooled in diplomacy. On the outbreak of the Greek war for independence (1821), he devoted his entire fortune to the equipment of a ship, and the arming of volunteers. He organized the insurrection in Ætolia and Acarnania, was made president of the national assembly at Epidaurus, drew up the provisional constitution, and signed the proclamation of independence (January 1822). He also became president of the executive council, but resigned in what he believed to be the interests of harmony. In 1833-4, 1841-3, 1844, and 1854-6 he was at the head of the cabinet, and in 1850-4 was ambassador at Paris. He promoted public education, and was a Liberal in politics, being of the British party and opposed to the Russian policy of Giovanni and Augustin Capo d'Istria. He is generally considered the most important leader in the Greek Revolution.

Max, mäs, **Gabriel von**, German painter: b. Prague 23 Aug. 1840. The son of a sculptor, with whom he studied for a time, he soon devoted himself to painting, then went to the Prague Academy under Engerth's teaching, and, after several years at Vienna, became a pupil of Piloty in Munich, where he was professor in the Academy from 1879 to 1883. His work is largely fantastic; he aims to interpret music, especially that of Beethoven, Mendelssohn, and Liszt; and is fond of psychic themes, although occasionally, as in his famous pictures of monkeys, going to an extreme of realism, explained by his earnest belief in Darwin and Haeckel. But he is best known for his historical and figure paintings, which usually show a female figure of some beauty and ethereal charm, with dreamy, longing, sentimental eyes. In such pictures as these the flesh tones are particularly remarkable, being sometimes styled marble-like and due to his early training as a sculptor, and again described as a twilight of sentiment, typifying the spiritual. To this class belong 'Spirit Greetings' (1879); 'The Last Token,' now in the Metropolitan Museum, New York (1874); 'Nydia' (1874); 'The Lion's Bride' (1875), and many book illustrations, notably those for Schiller's and for Lenau's poems, for Goethe's 'Faust' (the 'Marguerite before the Mater Dolorosa' being es-

MAXENTIUS — MAXIMILIAN

pecially well-known), for Wieland's 'Oberon' and for Uhland's works. Max was ennobled in 1900.

Maxentius, māk-sēn'shī-ūs, **Marcus Aurelius Valerius**, Roman emperor: d. 27 Oct. 312. He was the son of Maximianus, and in 306 A.D., was proclaimed Augustus by the praetorians, and acknowledged by the people and senate of Rome, to whom Galerius had become hateful. Severus, sent by Galerius against him and his father, was compelled by Maximianus to retreat to Ravenna, and was put to death in 307. Galerius was likewise compelled to retreat and Maxentius, availing himself of an insurrection of the Africans under a certain Alexander, in 311, declared war against Constantine the Great. While Constantine pressed forward into Italy, Maxentius himself remained inactive at Rome, and did not go out to meet Constantine till he had passed unopposed across the Apennines. At the great battle fought shortly after, at Saxa Rubra near Rome, Maxentius was defeated, and perished in the Tiber as he tried to escape over the Mulvian Bridge.

Max'ey, Samuel Bell, American soldier: b. Tompkinsville, Ky., 30 March 1825; d. Eureka Springs, Ark., 16 Aug. 1895. He was graduated from West Point in 1846 and served with honor in the Mexican War, receiving the rank of 1st lieutenant for bravery at Contreras and Churubusco. He afterward was stationed at the Jefferson barracks, but resigned in 1849, studied law and in 1850 was admitted to the bar and opened a practice in Kentucky. He removed in 1857 to Texas where he continued his law practice until the outbreak of the Civil War. He entered the Confederate army and served through the war, rising to the rank of major-general. In 1874 he was elected to the United States Senate and served two terms.

Maxilla (Latin, "jaw"), the jaw-bone of a vertebrate; especially the upper jaw-bone as distinguished from the lower jaw or mandible. In invertebrates the term is applied to one of the pair or pairs of jaws. The maxilla is either used in mastication (q.v.) or the chewing of food, or in seizing it.

Max'im, Sir Hiram Stevens, American inventor and engineer: b. Sangersville, Maine, 5 Feb. 1840. He was apprenticed to a carriage-maker in his youth; after several years in a machine-shop in Fitchburg, Mass., where he perfected his knowledge of mechanical engineering and drawing and supplemented his scanty education, he went to Boston as foreman in a factory of philosophical apparatus. From Boston he went to New York as employee of the Novelty Iron Works and Shipbuilding Company; took out patents for an automatic gas machine in 1867, and in 1877 for an incandescent electric light which would burn a month and a half. At about the same time he designed a process for flashing electric carbons and another for "standardizing" them. In 1881-2 he utilized the force of a gun's recoil to reload the gun and fire 770 shots a minute. The Maxim-Nordenfelt Company, combining Maxim's machine-gun patents with those of Nordenfelt, was formed in 1888, and reorganized in 1897 as Vickers Sons and Maxim. Of these two firms Maxim has been the European representative. His other patents are for various smokeless pow-

ders and several motors, mostly driven by petroleum. Of late much of his time has been spent in studying aeronautics. He became an English subject because of the alleged unfairness toward him of the United States government, and in 1901 was knighted by Queen Victoria.

Maximianus I., māk-sīm-i-ā'nūs, **Marcus Aurelius Valerius**, Roman emperor: d. February 310 A.D. He so approved himself by his services in the army that Diocletian selected him for his colleague, creating him first Cæsar (285), then Augustus (286), and at the same time conferred on him the honorary appellation of Herculius. Maximianus had the care of the Western Empire, while Diocletian undertook that of the Eastern. In 287 he was consul with Diocletian, and in the same year conducted a campaign in Gaul. After conducting several wars, in 303-304 he was for the 7th time made consul, having for his colleague Diocletian for the fifth time, with whom he abdicated 1 May 305. In the following year he was again invested with the imperial title by his son Maxentius, to whom his services against Severus and Galerius were of the most important kind. His son shortly after expelled him from Rome, and repairing to Gaul, in 308 caused himself to be proclaimed Augustus at Marseilles, but Constantine easily deposed him.

Maximilian I., māk-sī-mī'l'i-ān (Ger. mäs-kē-mē'lē-ān), emperor of Germany: b. Neustadt, near Vienna, 22 March 1459; d. Wels, Upper Austria, 12 Jan. 1519. In 1486 he was elected king of the Romans, and succeeded his father, Frederick III., as emperor in 1493. He first became an independent prince by his marriage with Mary of Burgundy, the daughter of Charles the Bold, who died in 1477. This match involved him in a war with Louis XI., king of France, in which he was successful, though he was defeated at a later period by the Milanese. He was succeeded by his grandson Charles V.

Maximilian, duke of Bavaria: b. Munich 17 April 1573; d. Ingolstadt 27 Sept. 1651. He was educated in the University of Ingolstadt and actively opposed to the Protestant cause. He established the Catholic League in 1606, and placed his army under the command of the Count of Tilly, one of the great generals of the age. He concluded the truce of Ulm in 1647. Consult: Wolf, 'Geschichte Maximilians I. und seiner Zeit' (continued by Breyer 1807-11).

Maximilian, Emanuel, elector of Bavaria: b. 11 July 1662; d. Munich 26 Feb. 1726. He succeeded Ferdinand Maria, his father, in 1679. He fought against the Turks in the long war which began in 1683, and in 1692 became governor of the Low Countries. Siding with France in the war of the Spanish succession, he was put under the ban of the empire, and, in 1706, deprived of his estates, regaining them, however, at the Peace of Baden in 1714.

Maximilian, Joseph, 1st king of Bavaria: b. Schwetzingen, Baden, 27 May 1756; d. Nymphenburg near Munich, 13 Oct. 1825. He succeeded his uncle, Charles Theodore, as elector in 1799. He was a supporter of Napoleon, and gave his daughter in marriage to Eugene Beauharnais in 1806. In the same year his duchy was

MAXIMILIAN — MAXWELL

erected into a kingdom. In 1813, however, he was member of the league against the emperor, and thus retained his throne after the fall of Napoleon. His reign was distinguished by the introduction of many administrative reforms.

Maximilian, emperor of Mexico, known in his earlier life as Ferdinand Maximilian Joseph, Archduke of Austria: b. Vienna 6 July 1832; d. Queretaro, Mexico, 19 June 1867. He was the younger brother of Francis Joseph I., emperor of Austria (q.v.). He entered the Austrian navy in 1846, and in 1854 obtained the rank of rear-admiral, and was placed at the head of the Austrian marine. He was viceroy of the Lombardo-Venetian kingdom in 1857-9, and in 1857 married Princess Charlotte of Belgium, daughter of King Leopold I. On his return from a voyage made to Brazil for scientific purposes he fixed his residence at Miramar in the vicinity of Trieste, and there, 3 Oct. 1863, received a deputation from the Mexican Assembly of Notables, who offered him the crown of their country. He officially announced his acceptance 10 April 1864. He landed at Vera Cruz on 28 May and entered Mexico on 12 June. He set himself energetically to consolidate and develop his dominions, granted an amnesty to political offenders, and exhibited great interest in religious worship and education. But he failed to conciliate the Republican party, and as he did not restore to the clergy their confiscated estates they pronounced him a traitor. Meanwhile there were incessant conflicts between the partisans of President Juarez and the allied French and Imperial troops; and the decree of 2 Oct. 1865, by which the members of the Juarist bands and those who abetted them were to be regarded as bandits and shot, alienated the party of the Liberals. Juarez raised the standard of independence. Complications and misfortunes thickening around Maximilian rendered his position critical in the extreme. The empress in vain undertook a mission to Europe to enlist support for her husband, and grief and disappointment overthrew her reason. The French troops, largely by reason of the representations of the United States government, were withdrawn by Napoleon in March 1867; but Maximilian decided to remain in the hope of being able to maintain the empire. While bravely defending Queretaro against a Liberal force under Escobedo, he was betrayed by General Lopez on the night of 14 May 1867. Tried by court-martial, he was sentenced, with his principal officers, to be shot. The sentence was carried into effect on the morning of 19 July. Maximilian's body was after some delay surrendered to his relatives, and his funeral was celebrated with great pomp in the cathedral of Vienna on 18 Jan. 1868. Maximilian was a man of eminent abilities, and high and varied culture. His collected writings are contained in a posthumous publication entitled '*Aus meinem Leben: Reiseskizzen, Aphorismen, Marinebilder*' (1867), which gives ample testimony to the vigor of his intellect and the variety of his attainments. See MEXICO, *History*.

Maximinus, māk-sī-mī'nūs, **Caius Julius Verus**, Roman emperor: d. Aquileia 238 A.D. He was at first a shepherd in Thrace, and when about 20 years of age became a soldier in the Roman armies, where he was distinguished by

his gigantic stature. His capacity for fighting procured him rapid advancement, and under Alexander Severus he had the command of a legion on the Rhine. In 235 A.D. he took part in a conspiracy against Alexander, and after his murder of the latter by the soldiers was proclaimed emperor. The Gordiani having been proclaimed in Africa, Maximinus hastened to Italy and laid siege to Aquileia. He was there murdered by his soldiers, together with his son.

Maximinus Daza, Caius Galerius Valerius, Roman emperor: d. 313 A.D. He was an Illyrian peasant, who was named Cæsar by the influence of his uncle Galerius, 305, and proclaimed emperor in 308. He is remembered for his fierce persecution of the Christians. He poisoned himself after his defeat by Licinius.

Max'inite. See EXPLOSIVES.

Maximum Thermometer. See THERMOMETER.

Maximus, māk-sī-mūs, **Clodius Pupienus**, Roman emperor: d. 238. He was a Roman general, proclaimed emperor by the Senate with Decimus Cælius Balbinus, in opposition to Maximinus, in 237. The next year he was killed with Balbinus by the prætorian guards.

Maximus, Magnus, Roman emperor: b. in Spain; d. 388. In 383 while commanding the Roman army in Britain he proclaimed himself emperor. Gratian marched against him, but was defeated and assassinated, and Maximus, having made himself master of Gaul, Britain, and Spain, fixed the seat of his empire at Treves. He then advanced into Italy, and was besieged in Aquileia by the Emperor Theodosius. His soldiers delivered him up to Theodosius, who caused him to be beheaded.

Maximus, Petronius, Roman emperor: d. 455. He succeeded Valentinian III. in 455, and less than three months afterward was slain in the streets, while fleeing from the fleet of Genseric, king of the Vandals, summoned by Eudoxia, the widow of Valentinianus.

Max'well, Augustus Emmett, American jurist: b. Elberton, Ga., 21 Sept. 1820; d. Shipley, Fla., 5 May 1903. He was educated in Alabama and in the University of Virginia; settled in Tallahassee, Fla., in 1845; was a member of the State legislature, then secretary of state, and later attorney-general; was elected to Congress in 1853, serving until 1857; and from 1862 to 1865 was a member of the Senate of the Confederate States, of which, with the exception of ex-Senator Vest, he was the last survivor. After the war he was judge of the supreme court of Florida (1866), circuit judge (1877-85), and chief justice of the State (1887-91).

Maxwell, Sir Herbert Eustace, 7TH BARONET OF MONTEITH, Scottish author: b. Edinburgh 8 Jan. 1845. He was educated at Oxford, was junior lord of the treasury 1886-92, and is president of the Society of Antiquaries of Scotland. Among his many publications are: '*Noontide Essays*' (1892); '*Scottish Land Names*' (1894); '*Rainy Days in a Library*' (1896); '*Sixty Years a Queen*' (1897); '*Life of the Duke of Wellington*' (1899); '*Memoirs of George Romney*' (1902); '*The Creevy Papers*' (1903).

MAXWELL — MAY

Maxwell, James Clerk, Scottish natural philosopher: b. Edinburgh 13 Nov. 1831; d. Cambridge, England, 5 Nov. 1879. He was educated at Edinburgh and at Trinity College, Cambridge, and in 1856 was appointed professor of natural philosophy in the Marischal College, Aberdeen, and held that office till its amalgamation with King's College to form the University of Aberdeen in 1860, when he was appointed to a similar chair in King's College, London. In 1857 he obtained the Adams prize at Cambridge for an essay 'On the Stability of Motion of Saturn's Rings.' From 1855 to 1872 he published his investigations on 'Perception of Color, and Color Blindness,' which obtained for him the Rumford medal and his election as F. R. S. He resigned his chair in 1865, and in 1871 was elected unopposed to the newly founded chair of experimental physics at Cambridge. He directed the formation of the Cavendish laboratory founded by the Duke of Devonshire and opened in 1874. In 1871 he published his 'Theory of Heat,' which has gone through several editions. In 1873 appeared his great work, 'Electricity and Magnetism.' Maxwell's fame will rest on his being the one who took the first grand step toward the discovery of the true nature of electrical phenomena. He rejected the theory of electrical "action at a distance," and sought to explain all electrical and magnetic phenomena as the results of local strains and motions in a medium whose contiguous parts only act on one another by pressure and tension. His scientific papers have been collected by W. D. Niven (1890). Consult: Campbell and Garrett, 'James Clerk Maxwell' (1882); Glazebrook, 'James Clerk Maxwell and Modern Physics' (1896).

May, Edward Harrison, American artist: b. London, England, 1824; d. Paris, France, 17 May 1887. He came to America when a boy, studied civil engineering, and then devoted himself to painting, working first under Daniel Huntington in New York and then under Couture in Paris. He painted portraits and historical and genre subjects; and his best pictures are the portraits of Laboulaye (1866), in the Union Club, New York, and Anson Burlingame (1869); and 'The Dying Brigand' (1855), now in the Philadelphia Academy of Fine Arts; 'Milton Dictating to his Daughters'; and 'Mary Magdalene at the Sepulchre.'

May, Georgiana Marian Craik, English novelist: b. London, England, April 1831; d. Saint Leonard's, Sussex, 1 Nov. 1895. She was a daughter of G. L. Craik (q.v.) and was married to A. W. May. Her principal novels, which are concerned mainly with domestic life, are: 'Riverstone' (1857); 'Lost and Won' (1859); 'Winifred's Wooing' (1862); 'Mildred' (1868); 'Sybil's Choice' (1874); 'Hilary's Love Story' (1880); 'Godfrey Helstone' (1884); 'Patience Holt' (1891); 'Dorcas'; 'Only a Butterfly'; 'Anne Warwick.'

May, Phil, English illustrator: b. Leeds 22 April 1864; d. Camden Hill 5 Aug. 1903. He was son of an engineer; had his schooling in Leeds; was apprenticed there to a lawyer, whom he soon left to join a company of players; for them he designed posters; and in 1884 and 1885 began drawing for 'Society' and 'St. Stephen's Review.' After his marriage he went out to

Sydney, Australia, where he gained some fame as artist of the *Bulletin*, and was forced by the exigencies of newspaper illustration to a very scanty use of line and a complete omission of anything else. In 1887 he went to Paris; returned to his work on 'St. Stephen's Review'; then began to draw for 'Graphic,' traveling through America; and shortly after Du Maurier's death was taken on the staff of 'Punch.' He must rank with Leech, Tenniel, and the other great British caricaturists. His art was remarkably simple and telling, his method, it is said, being to reduce an elaborate and detailed drawing to the fewest possible lines. He was particularly happy in his portrayals of London street-life, which are full of humor and sympathy; his Parliament sketches are only less felicitous and the likenesses in them are excellent. His own hatchet face, "banged" hair, and ever-present cigar figure in many of his sketches. From 1892 to his death he published 'Phil May's Annual.' His other collections of drawings are: 'Parson and Painter' (1891); 'Phil May's Sketch Book' (1896), and 'Phil May's Gutter-Snipes' (1896).

May, Samuel, American reformer and Unitarian clergyman: b. Boston, Mass., 11 April 1810; d. Leicester, Mass., 24 Nov. 1899. He was graduated from Harvard in 1829, and from the Harvard Divinity School in 1833. In 1834 he became pastor of the Unitarian Church at Leicester, Mass., but when his strong abolitionist views became unacceptable to his parishioners, he resigned (1846). He was secretary of the Massachusetts Anti-Slavery Society from 1847 to 1865, and secretary of the American Anti-Slavery Society for several years, and was continually active in the abolition movement. After the Civil War he interested himself in many other reforms, and in 1875 was elected to the State legislature. He was a frequent contributor to the 'Liberator' and 'Anti-Slavery Standard'; and published 'The Fugitive Slave Law and its Victims.'

May, Samuel Joseph, American Unitarian clergyman and reformer: b. Boston, Mass., 12 Sept. 1797; d. Syracuse, N. Y., 1 July 1871. He was graduated from Harvard in 1817, studied for the ministry at Cambridge, was ordained at Boston to the Unitarian ministry 14 March 1822, and was pastor of churches at Brooklyn, Conn., 1822-36, South Scituate, Mass., 1836-42, and Syracuse, N. Y., 1845-67. In 1842-4 he was principal of the girls' normal school at Lexington, Mass., and in 1867-71 did missionary work in Central New York for the American Unitarian Association. As early as 1826 he was known as a preacher and writer against slavery, and for his advocacy of immediate emancipation was burned in effigy at Syracuse in 1830. In 1833 he was one of the organizers of the National Anti-Slavery Society, and was a signer of Garrison's "Declaration of Sentiments." From 1835 to 1853 he was general agent of the Massachusetts Anti-Slavery Society, and in connection with this post traveled extensively and spoke frequently. His life, like that of many another abolitionist, was often in danger, and he was repeatedly mobbed. He was among the more conservative anti-slavery leaders in his methods, and was prominent also in charity and education. His 'Recollections of the Anti-Slavery Conflict' (1868) is a highly valuable

MAY — MAYA INDIANS

work. Consult Mumford, 'Memoir of S. J. May' (1873).

May, Thomas, English dramatist and historian: b. Mayfield, Sussex, 1594; d. London 13 Nov. 1650. He was educated at Cambridge, became a member of Gray's Inn and figured brilliantly at court. He published: 'Antigone,' 'Cleopatra,' 'Agrippina,' and other dramas and translations of the 'Georgics' and Lucan's 'Pharsalia.' He espoused the cause of Parliament in the Civil War, was made secretary and historiographer to Parliament, and wrote 'History of the Parliament of England, 1640-3' (1650; several times republished), and a 'Breviary' of the same history (1650).

May, Thomas Erskine, BARON FARNBROUGH, English historian: b. London 8 Feb. 1815; d. Westminster 17 May 1886. He was educated at Bedford grammar-school, became assistant librarian to the House of Commons in 1831, and was called to the bar in 1838. He was appointed examiner of petitions for private bills in 1846, and clerk to the House of Commons in 1871. He was knighted in 1866, and just prior to his retirement from office in 1886, was raised to the peerage. He is best known as an antiquarian and historian. His chief works are: 'A Practical Treatise on the Law, Privileges, Proceedings, and Usages of Parliament' (1844; 10th ed., much enlarged, 1893); 'Constitutional History of England since the Accession of George III., 1760-1860 (1861-3; republished with supplementary chapter, 1871); 'Democracy in Europe: a History' (1877). In 1854 he collected and reduced to writing the 'Rules, Orders, and Forms of Procedure of the House of Commons.'

May, the 5th month of the year, having 31 days. It was 2d in the old Alban calendar, 3d in that of Romulus, and 5th in that of Numa Pompilius. The etymology of the word is doubtful. It was called *Maius* by Romulus, in respect to the senators and nobles of his city, who were called *Majores*, as the month following was called *Junius*, in honor of the youth of Rome who served him in war and were named *Juniates*. Some etymologists are of opinion that it was called *Maia*, from the goddess of that name, the mother of Mercury, to whom they offered sacrifices on the first day of the month. The sun enters Gemini during May, and the plants of the earth generally begin to flower. See CALENDAR.

May Apple. See MANDRAKE.

May Beetle, or **June Bug**, popular names for the clumsy brown beetles of the genus *Lachnosterna* (family *Scarabæida*) common throughout the United States. The adults fly by night during late spring and often are troublesome upon the young foliage of trees and shrubs. They are attracted by light and may be trapped in this way. The larvæ are large, brown-headed, white-bodied grubs which feed upon the roots of grass, etc., passing one or more years in the ground. For this reason strawberries and other crops which they attack should not be planted upon freshly turned sod land. Late fall plowing is often practised to destroy them.

May-bird, a gunner's name for various shore-birds which return from the South in the month of May, especially the Knot (q.v.). In New England the black-bellied plover, and in the South a curlew, are called May-birds or May-cocks.

May Cherry, a local name for the service-berry bush. See AMELANCHIER.

May-fly, **Shad-fly**, or **Day-fly**, members of the order *Ephemera*. The species, of which about 300 have been described, nearly one third of which are North American, are fragile insects with large fore-wings, small or wanting hind-wings, short antennæ, atrophied mouth parts, and two or three thread-like abdominal filaments. Being greatly attracted to lights, the adults are often a source of annoyance in lake-side and river-side towns, and are sometimes especially troublesome in obscuring the lights from light-houses. The eggs are laid in fresh water either upon the surface or upon the bottom, the female diving for this purpose. The larvæ, which feed mainly upon vegetable matter, are active creatures with strong legs, abdominal tracheal gills and anal appendages. They live upon the bottom, under stones, covered with mud, or in burrows. After moulting about ten times wing pads appear, and these increase with each moult until the last, which may be number twenty. This occurs in the open air, the one previous to which occurs at the surface of the water, the insect escaping from its sub-imago skin rather suddenly. One striking difference the adults exhibit is the development of paired sexual organs, which do not appear in other orders of insects. The larvæ may take three years to develop; the adults live only a few days, lay their eggs and die. Both adults and larvæ are important food for fishes, and consequently they form a favorite bait with anglers, and are imitated in making artificial flies.

Maya (mā'a or mā'yā) **Indians**, the aboriginal race or people of Yucatan (q.v.). At one time they were the most advanced of American Indian races, but the descendants of the race to-day are sadly degenerated. The Mayas of ancient days had a written language and left numerous examples of MSS., letters and picture writing. They made wooden covers for their books, and manufactured paper from leaves or vegetable fibre, joined edge to edge and folded like a fan. Over the whole page were pictures painted in all sorts of colors, which was their way of writing.

The Mayas and Aztecs (q.v.) had much in common. Their religions were related; both adored many of the same deities—especially the sun. Both worshipped idols carved from stone, and both sometimes sacrificed human victims. Among the Mayas there may have been a greater tendency toward a monarchical government than among the Aztecs; but here, too, an elected council was the real power. In method of warfare the two people were much alike, but the Mayas, though brave, were not so warlike as the Aztecs and paid more attention to agriculture and the arts. The people lived well, dressed in cotton of their own raising and weaving, made many ornaments of gold and greenstone, and were expert feather-workers. They surpass all American tribes in their architecture and in their carving in stone. Though without iron tools, they were able to erect fine buildings of stone, carved with remarkable and beautiful designs. In the wild forests of Yucatan and Central America, in the midst of dense tropical woods, overgrown with trees and tangled vines, are the deserted ruins of upward of 40 ancient towns. These different towns were connected by paved roads

MAYAGUEZ—MAYER

of stone, over which couriers ran, carrying letters, along which traders bartered and dickered, and on which the forces of one town would often march out to capture and sack some other town. In many cases the buildings were set upon a great flat-topped mound, with sloping sides and rectangular base and summit. These buildings were sometimes constructed around the sides of a square court, the doors all opening into the court. Such buildings were doubtless the houses in which dwelt many families, as in the pueblo houses in New Mexico. There are also temples for purposes of worship. In such there is usually found a tablet in the wall and an altar for sacrifice. The interior decoration of rooms was often elaborate, the walls being covered with stucco, on which were painted in brilliant colors paintings which furnish us much information of the dress, manners, gods, and worship of the people. Often these designs are in low relief. One of the most famous Mayan works of art is in the temple at Palenque, where is a remarkable tablet on which is represented a sacrificial scene. Copan is a most interesting Mayan town.

Mayaguez, mā-yā-gwas', Porto Rico, a seaport city on the Mayaguez River near the west coast, the capital of Mayaguez Department, 72 miles southwest of San Juan. The city was founded in 1752 and has a modern appearance, with wide streets, fine buildings, electric lights and a street railway. It has a large but shallow harbor, and its port is three miles distant at Mayaguez Playa, where a considerable export trade in coffee and oranges is carried on. Pop. (1899) 15,187.

Maybrick, Michael ("STEPHEN ADAMS"), English composer: b. Liverpool about 1845. He studied music in Italy and Germany, and was for many years a leading baritone vocalist in concerts and English opera. As a writer of songs over the signature "Stephen Adams," he has been widely popular in this country and England. Among the best known of his many songs are: 'Nancy Lee'; 'Alsatian Mountains'; 'The Holy City'; 'A Warrior Bold.'

Mayence, mā-yōñs. See MAINZ.

Mayer, mā'ér, Alfred Marshall, American physicist: b. Baltimore 13 Nov. 1836; d. Maplewood, N. J., 13 July 1897. He studied at St. Mary's College, Baltimore; spent two years in a machine-shop and draughting-room; specialized in chemistry and physics; became professor of these branches in the University of Maryland (1856), and in Westminster College, Fulton, Mo. (1859); after two years of study in Paris, was appointed to a chair in Pennsylvania College, Gettysburg (1865); went thence to Lehigh University in 1867; and from 1871 to his death was professor of physics in Stevens Institute, Hoboken, N. J. There he made important researches in acoustics; invented the tophophone, an apparatus to detect the phases of sound vibration; discovered five methods of analysis of compound sounds into their elementary tones; and stated the law of tuning-fork vibration. He wrote many papers for the 'American Journal of Science,' notably a series entitled 'Researches in Acoustics'; several contributions to the 'Scientific American Supplement'; 'Lecture Notes on Physics' (1868); 'The Earth a Great Magnet' (1872); 'Light' (1877); and 'Sound' (1878).

Mayer, Brantz, American author: b. Baltimore 27 Sept. 1809; d. there 21 March 1879. He was educated at St. Mary's College, Baltimore, studied law by himself during an Oriental voyage in 1827-8 and then at the University of Maryland; was admitted to the bar in 1829; and after a year in Mexico as secretary of legation wrote 'Mexico as it Was, and as it Is' (1844). In the same year he founded the Maryland Historical Society. In the Civil War he sympathized with the Union, was president of the Union State General Committee, and from 1863 to 1871 paymaster in the U. S. army. His best book was 'Captain Canot'; a story of the slave trade founded on fact. He also wrote 'Mexico, Aztec, Spanish, and Republican' (1851); 'Mexican Antiquities' (1858); 'Memoir of Jared Sparks' (1867), and 'Baltimore as it Was, and as it Is' (1871).

Mayer, Constant, American artist: b. Besançon, France, 4 Oct. 1852. A student at the School of Fine Arts in Paris, he left his studies in 1857 and settled in New York, where his sketches and portraits won immediate success. His portraits of Grant and Sherman and his life-sized genre paintings, such as 'Maud Müller'; 'The Song of the Shirt'; 'Evangeline,' gained much popularity. Since 1866 he has been an associate of the National Academy of Design.

Mayer, Frank Blackwell, American artist, brother of Alfred Marshall Mayer (q.v.) and nephew of Brantz Mayer (q.v.): b. Baltimore 27 Dec. 1827. He studied art there under A. J. Müller, and under Gleyre and Brion in Paris and then settled in Annapolis. He made a special study of Dakota Indian types; contributed to 'Harper's' and 'Century' various articles with his own illustrations; and exhibited in the Paris Salon and at the Centennial Exhibition of 1876, where he received a medal for two pictures, 'The Continentals' and 'Attic Philosopher.' Among his other canvases are 'Feast of Mondawmin'; 'The King's Fool'; 'The Trappist'; 'Maryland in 1750'; 'Crowning a Troubadour,' and 'The Treaty of Traverse des Sioux.'

Mayer, Henry, American caricaturist: b. Worms, Germany, 18 July 1868. Educated in Germany and England, he at first followed a business career in the latter country, but emigrating to the United States in 1887, soon won for himself a distinct place as caricaturist, by his designs and illustrations for American and European papers. Since 1893 he has resided in New York. His works are: 'Autobiography of a Monkey' (1896); 'In Laughland' (1899); 'Fancies on Ha-Ha' (1899); 'A Trip to Toyland.'

Mayer, mi'ér, Julius Robert von, German physicist: b. Heilbronn, Württemberg, 25 Nov. 1814; d. there 20 March 1878. He was educated at the gymnasium in Heilbronn, studied medicine at Tübingen, and finished his university studies at Munich and Paris. In 1840 he went to Java as a ship's surgeon, and while there turned his attention to studies of the blood, extending his work to exhaustive investigations of animal heat, to which he applied the mechanical theory. Returning in 1841 to Heilbronn, where for some years he practised his profession, he became deeply engrossed with his scientific labors, and in 1842 published in Liebig's 'Annalen der Chemie und Pharmacie' a preliminary statement of his revolutionary theory of heat, together with his views on the conservation and

THE MAYFLOWER IN PLYMOUTH HARBOR

THE MAYFLOWER IN PLYMOUTH HARBOR

MAYFAIR—MAYHEW

correlation of energy. Three years later he re-stated his results, at the same time giving a forecast of his theory of the meteoric origin of the sun's heat. Contemporaneously with Mayer the mechanical theory of heat was worked out independently by J. P. Joule (q.v.) in England, and a controversy arose regarding the priority of discovery. The Royal Society gave Mayer the Copley medal in 1871, and two years before his death he was ennobled by the king of Württemberg. His collected works appeared in 1867 under the title of 'Die Mechanik der Wärme.' Consult Weyrauch, 'Robert Mayer' (1890), and Gross, 'Robert Mayer and Hermann von Helmholtz' (1898).

Mayfair, London, England, a fashionable neighborhood in the "West End" adjoining Belgravia. See LONDON.

Mayfield, Ky., city, county-seat of Graves County; on the Illinois Central railroad; about 30 miles from the Mississippi River and 25 miles from the Ohio at the mouth of the Tennessee. It was settled about 1820 and incorporated in 1850. It is in a fertile agricultural region in which the chief product is tobacco. Mayfield has large tobacco warehouses and factories, clothing factories, woolen mills, fire-clay works, flour and lumber mills. It has an extensive trade in tobacco. The mayor is elected once in four years; the council acts upon the appointments of the executive. Pop. (1890) 2,909; (1900) 4,081.

Mayflower, *The*, the name of the vessel in which the Pilgrim Fathers, or first colonists in New England, sailed to this country in 1620. The Mayflower was a vessel of 180 tons. She set sail from Southampton, England, on 5 Aug. 1620, in company with her sister ship, the Speedwell, but the courage of the captain and the crew of the latter vessel failing, both ships put back to port. Finally on 6 September the Mayflower again spread her sails from Plymouth, having on board as passengers 41 men and their families, 102 persons in all. They succeeded in crossing the Atlantic, after a stormy voyage of 63 days. They intended to go to the mouth of the Hudson River but the captain of the Mayflower took them to Cape Cod. They landed at Plymouth, Mass., at a point where Plymouth Rock (q.v.), a huge granite boulder, stands at the water's edge. A complete and authentic list of the male passengers who landed from the Mayflower is as follows:

THE MAYFLOWER PASSENGERS.

Allerton, Isaac	Hopkins, Stephen
Allerton, John	Howland, John
Billington, John	Leister, Edward
Bradford, Wm.	Margeson, Edward
Brewster, Wm.	Martin, Christopher
Brittenger, Richard	Mullins, William
Brown, Peter	Priest, Degony
Carver, John	Rigdale, John
Chilton, James	Rogers, Thomas
Clarke, Richard	Soule, George
Cook, Francis	Standish, Miles
Crackston, John	Tilly, Edward
Dotey, Edward	Tilly, John
Eaton, Francis	Tinker, Thomas
English, Thos.	Turner, John
Fletcher, Moses	Warren, Richard
Fuller, Edward	White, William
Fuller, Samuel	Williams, Thomas
Gardiner, Richard	Winslow, Edward
Goodman, John	Winslow, Gilbert

With these 41 male passengers and heads of families came 15 male servants, whose names were as follows:

SERVANTS ON THE MAYFLOWER.

Carter,	Langmore,	Sampson,
Coper,	Latham,	Story,
Ely,	Minter,	Thompson,
Holbeck,	Moore,	Trevore,
Hooke,	Prower,	Wilder.

The following is a copy of the covenant agreed upon by these first settlers of Massachusetts, signed and subscribed on board the Mayflower at Cape Cod, 11 Nov. 1620, two days after the ship came to anchor:

THE MAYFLOWER COMPACT.

In the name of God Amen! We whose names are underwritten, the loyal subjects of our dread sovereign Lord, King James, by the grace of God, of Great Britain, France and Ireland, King, Defender of the Faith, etc., have undertaken for the glory of God and the advancement of the Christian faith, and honor of our King and Country, a voyage to plant the first colony in the northern parts of Virginia; do by these presents, solemnly and mutually, in the presence of God and of one another covenant and combine ourselves together into a civil body politic for our better ordering and preservation, and furthermore of the ends aforesaid; and by virtue hereof to enact, constitute and frame just and equal laws, ordinances, acts, constitutions, and offices from time to time, as shall be thought most mete and convenient for the general good of the colony; unto which we promise all due submission and obedience. In witness whereof we have hereunto subscribed our names, at Cape Cod, the 11th of November, in the year of the reign of our sovereign Lord, King James of England, France and Ireland, the Eighteenth, and of Scotland the Fifty-fourth, Anno Domini 1620.

Whittier, Lowell, Holmes, and other poets have immortalized the Mayflower in well known poems.

Mayflower Descendants, Society of, an American patriotic society founded in New York city 22 Dec. 1894. Its membership is confined to lineal descendants of any passengers on the Mayflower, the voyage of which terminated at Plymouth Rock, Mass., in November 1620. There are also numerous State societies of a similar character. In 1901 there were over 2,000 members of the society.

Mayflower. See ARBUTUS, TRAILING.

May'hem, in law, the maiming of one person by another, the destroying or disabling of an arm, leg, hand, or foot, putting out an eye, etc. Mayhem renders the perpetrator liable to a civil action for damages, and also to a criminal prosecution.

Mayhew, mā'hū, **Experience**, American missionary: b. Martha's Vineyard, Mass., 27 Jan. 1673; d. there 29 Nov. 1758. He took charge of a half-dozen congregations of Indians, and in 1709 executed for the Society for the Propagation of the Gospel in New England a translation of the Psalms and of the Gospel according to St. John into the Indian tongue. His principal writing is 'Indian Converts' (1727), containing accounts of 30 Indian ministers and 80 other Indian Christians.

Mayhew, Henry, English journalist and author: b. London 25 Nov. 1812; a. 25 July 1887. In 1831 he started, with Gilbert A'Beckett, a periodical called 'Figaro in London'; in 1841 produced, with A'Beckett, the farce of the 'Wandering Minstrel'; and not long after formed a literary partnership with his brother Augustus, the 'Brothers Mayhew,' as they came to be familiarly known, turning out a number of most successful works of amusing fiction. Among these may be mentioned: 'The Greatest Plague of Life, or the Adventures of a Lady in Search of a Good Servant' (1847); 'The

MAYHEW — MAYNOOTH

Image of His Father, or One Boy is More Trouble than a Dozen Girls' (1850); 'Living for Appearances' (1855). In 1851 appeared the first volume of his most important work, 'London Labor and the London Poor.' He was one of the founders of 'Punch' (1841) and its first editor. Other works of his are: 'The Wonders of Science, or Young Humphry Davy'; 'Young Benjamin Franklin'; 'The Boyhood of Martin Luther'; 'German Life and Manners, as Seen in Saxony at the Present Day'; 'The Criminal Prisons of London and Scenes of Prison Life' with Binny. His brothers Horace, Thomas, and Edward also assisted Henry and Augustus in their enterprises, beside publishing independently.

Mayhew, Jonathan, American clergyman: b. Martha's Vineyard, Mass., 8 Oct. 1720; d. Boston 9 July 1766. He was graduated from Harvard in 1744, and from 1747 until his death was minister of the West Church in Boston. In a day of theological controversy, he was prominent for his tracts. His views were so liberal as to exclude him from the Boston Association of Congregational Ministers. He opposed the measures of the British society for the propagation of the Gospel in foreign parts, and got into a dispute about it with Secker, archbishop of Canterbury. In both pulpit and press he was an earnest patriot, being of much assistance to Otis and other early leaders. Among his writings are: 'Seven Sermons' (1749); 'Discourse concerning Unlimited Submission and Non-resistance to the Higher Powers' (1750); and 'Sermons' (1756). Consult: The 'Memoir' by Bradford (1838); Tyler, 'History of American Literature.'

Mayhew, Thomas, American colonial governor: b. England 1592; d. Martha's Vineyard, Mass., March 1682. Prior to his emigration to New England he had been a merchant in Southampton. He settled first at Watertown, Mass., and in 1641 secured from the agent of Lord Stirling a grant of the larger part of the island of Martha's Vineyard and the title of governor. With his son Thomas he labored to convert the Indians of the island, so successfully that during King Philip's War the island Indians protected the white settlers. He founded Edgartown in 1647, and after the death of his son and grandson continued their ministry and organized an Indian church.

Maynard, mā'nard, Charles Johnson, American naturalist: b. West Newton, Mass., 6 May 1845. He had a common school education, worked on a farm, and devoted himself to natural history as a boy. He is well known as an ornithologist, discovered the bittern's vocal organs, and in 1875 was elected vice-president of the Nuttall Ornithological Club, in connection with which he founded and edited 'The Nuttall Bulletin.' As a conchologist he studied the genus *Cerion* of West Indian shells. He also made important additions to the knowledge of American butterflies. Maynard wrote: 'Naturalists' Guide'; 'Butterflies of New England'; 'Eggs of North American Birds'; 'Contributions to Science'; 'Manual of North American Butterflies'; 'Sparrows and Finches of New England'; 'Sponges'; 'Warblers of New England'; 'The Genus *Strophia*'; and 'Manual of Taxidermy.'

Maynard, Edward, American inventor: b. Madison, N. J., 26 April 1813; d. Washington, D. C., 4 May 1891. He entered West Point in 1831; resigned because of ill-health in 1832; studied dentistry; and practised in Washington from 1836 to 1890. He invented new dental tools; discovered in 1846 the diversity of the maxillary antra; introduced the method of filling cavities with gold foil; taught dentistry in the Baltimore College of Dental Surgery and in the National University at Washington; and practised successfully in Europe. His great fame was due to his invention of small arms and new priming methods which superseded percussion caps. He patented a breech-loading rifle in 1851; a method of converting muzzle-loaders to breech-loaders in 1860; a plan to join two barrels so that contraction and expansion in either would be independent of the other, in 1868; and in 1886 a registering device showing the number of cartridges in a magazine rifle. His rifle was adopted by the United States, and brought him decorations from the governments of Belgium, Prussia, and Sweden.

Maynard, George Willoughby, American artist, son of Edward Maynard (q.v.): b. Washington, D. C., 5 March 1843. He studied art in the Royal Academy of Antwerp; worked in Paris in 1878; then returned to America, where he received a medal from the Pennsylvania Academy of Fine Arts in 1884, and was elected to the National Academy in 1885. He was president of the Salmagundi Sketch Club and of the American Black-and-White Society. Besides his portraits, Maynard's most important canvases are: 'Vespers at Antwerp'; '1776'; 'Water Carriers of Venice'; 'A Musician'; 'Bachelor's Breakfast'; 'Ancient Mariner'; 'Old and Rare'; 'Strange Gods'; and 'Grandfatherly Advice.'

Maynard, Horace, American politician: b. Westboro, Mass., 30 Aug. 1815; d. Knoxville, Tenn., 3 May 1882. He was graduated from Amherst College in 1838; and became instructor, and later professor, in East Tennessee College, Knoxville, Tenn. He studied law, was admitted to the bar in 1844, and built up a successful practice. In 1857 he was nominated for member of Congress by the Know-Nothing party, and elected. On the outbreak of the Civil War he declared his loyalty to the Union and took an active part in the unsuccessful attempt to keep Tennessee from seceding; on this account he suffered persecution and heavy loss of property during the War. In 1866-75 he was again member of Congress, being representative-at-large for his State in the last two years. In 1875 he was appointed minister to Turkey, and, in 1880 postmaster-general in President Hayes' cabinet, holding the office till 4 March 1881.

Maynooth, mā-nooth', Ireland, a market-town of County Kildare, 13 miles by rail northwest of Dublin. Its modern celebrity is derived from the well-known Roman Catholic college of Saint Patrick (q.v.). Maynooth is of historic interest as the seat of the powerful Geraldines, and has ruins of their castle, built 1176 and enlarged in 1426. Several battles with the English occurred here, including the rebellion of Silken Thomas in the reign of Henry VIII., and the war of the Confederates (1641-50). Pop. under 1,000.

MAYNOOTH COLLEGE — MAYOW

Maynooth College. See SAINT PATRICK'S COLLEGE.

Mayo, mā'ō, Amory Dwight, American Unitarian clergyman and educator: b. Warwick, Franklin County, Mass., 31 Jan. 1823. He was graduated from Amherst, and taught in the public schools in Massachusetts 1839-44. In 1846 he became the minister of the Universalist Church at Gloucester, Mass., and later held Universalist pastorates at Cleveland, Ohio (1854-6), and at Albany, N. Y. (1856-63). He then entered the Unitarian ministry, and was pastor at Cincinnati, Ohio (1863-72), and at Springfield, Mass. (1872-80). He has long been prominent as an educator, was an efficient and active member of the boards of education in Cincinnati and Springfield, and was connected with the Meadville (Pa.) Theological School as lecturer and professor from 1868-98. Since 1880 he has devoted his attention chiefly to the advancement of education in the South, lecturing frequently in many different States. He has been the chief editorial writer for the 'New England and National Journal of Education,' and has published 'The Moral Argument for Universalism'; 'Graces and Powers of the Christian Life' (1852); 'Biography and Collected Writings of Mrs. S. C. E. Mayo'; 'Symbols of the Capitol, of Civilization in New York' (1859); 'Talks with Teachers' (1885); 'Southern Women in the Recent Educational Movement in the South' (1892); and 'History of the American Common School.'

Mayo, Frank, American actor: b. Boston 19 April 1839; d. 8 June 1896. His first appearance on the stage was at the American Theatre in San Francisco, and he was for several years the leading actor on the Pacific coast. In August 1865 he appeared in Boston as Badger in 'The Streets of New York' with great success, and though he played Shakespearian and other roles acceptably, became best known in his character of Davy Crockett, first played by him in Rochester, N. Y., in 1872, and thereafter almost exclusively by him till 1884. In later years he played in his own drama of 'Nordeck' and in a stage version of 'Pudd'nhead Wilson.'

Mayo, Isabella Fyvie, "EDWARD GARRETT," English novelist: b. London 10 Dec. 1843. She is of Scottish parentage, and was married to J. R. Mayo, a solicitor, in 1870. Since his death, in 1877, she has resided in Aberdeen. Among her works are: 'Occupations of a Retired Life' (1868); 'Friends and Acquaintances' (2d ed. 1872); 'By Still Waters' (new ed. 1886); 'The Capel Girls' (new ed. 1877); 'The House by the Works' (new ed. 1881); 'Equal to the Occasion' (1887); 'A Daughter of the Klephts' (1897); 'Chrystal Joyce' (1899). Her stories, many of which are semi-religious in cast, have been much read in this country.

Mayo, mi'ō, a tribe of Mexican Indians of the Pinan family, located on the banks of the Mayo River in southern Sonora. Their allies and northern neighbors are the Yaquis (q.v.), and their habits and language are almost identical. They are a peaceful, agricultural people and are thoroughly Mexicanized. They number perhaps 6,000.

Mayo-Smith, mā'ō-smith', Richmond, American political economist: b. Troy, Ohio, 9

Feb. 1854; d. New York city 11 Nov. 1901. He was graduated from Amherst College in 1875, and studied in Germany for two years. From 1877 he was connected with Columbia University, first as assistant in history and political science, then as adjunct professor (1878-83), and professor of political economy and social science (1883-1901). He was also one of the faculty of the graduate School of Political Science, established in 1880, and his chief work as teacher was done in this school. His specialty was statistics, on which he was a recognized authority. He was an honorary fellow of the Royal Statistical Society of Great Britain, a member of the International Statistical Institution and of the American Statistical Association, being vice-president of the latter; he was also a member of the National Academy of Science, and of the American Economic Association, of which he was one of the founders. He was editor of the 'Political Science Quarterly' from 1886, and published 'Emigration and Immigration' (1890); 'Statistics and Sociology' (1895); and 'Statistics and Economics' (1899).

Mayon, mā-yōn', a volcano of the Philippines situated in the northern part of the province of Albay, Luzon, height 8,274 feet. It rises from a broad plain about six miles from Albay Gulf, and forms a perfect cone; its summit is surrounded by vapor, which at night has a fiery glow. Its sides, almost to the top, are covered with grass or moss, and the ascent though it has been made, is difficult. Near the summit there are fissures which emit sulphurous gases and steam, and there were several eruptions during the 19th century, the town of Cagsaua at the foot of the mountain being entirely destroyed in 1814.

Mayonnaise, mā-ōn-āz', a thick cold dressing for salads, cold meat, poultry, fish, vegetables, etc., made of the yolks of eggs, salad oil, and vinegar, with a little salt and pepper; it is sometimes colored red with powdered lobster shell, or green with spinach or parsley.

Mayor des Planches, mā'yōr dā plānch'āz, Edmondo, Italian ambassador to the United States: b. 27 July 1851. He was graduated from the University of Turin in 1874 and entered the diplomatic service the next year. He was secretary to the prime minister Depretis 1876-8, and was Crispi's chief of cabinet 1887-1901. He was minister at Belgrade 1898-1901 and since the last named date has been ambassador to this country. He has published 'La Signora di Kruedner' (1881); 'Crispi chez Bismarck' (1894); 'Nuove Lettere del Conte di Cavour' (1895); etc.

Mayor. See MUNICIPAL GOVERNMENT.

Mayotta, mā-yōt'tā, or Mayotte, mā-yōt'. See COMORO ISLANDS.

Mayow, mā'ō, or Mayo, John, English physiologist and chemist, the first to attack the theory of phlogiston: b. London May 1643; d. there October 1679. He was of a Cornish family; entered Wadham College, Oxford, in 1658; became a scholar there in 1659; and was elected a fellow of All Souls in 1660. He was graduated in 1665; studied medicine; practised in Bath; and in 1678 was elected to the Royal Society. His Latin tract on the Respiration appeared in 1668; it urged that the heart was

a mere muscle, that breathing is simply to give the nitroaerian constituent (oxygen) to the blood, and that this constituent is necessary to life. In 1674 he published 'Tractatus Quinque,' summarizing and completing his theory; in this work he showed that "fire-air," "nitre air" or "aerial spirit," as he styled oxygen, is contained in all acids and is necessary to combustion and respiration, which are therefore analogous.

Mayoyaos, mā-yō-yā'ō, a native tribe of the island of Luzon, Philippines, living in the southwestern part of the province of Isabela and in the northwestern angle of the province of Nueva Vizcaya. They are a head-hunting tribe of Malay race; and of the Ifugao linguistic stock.

Maysville, mǎz'vīl, Ky., city, county-seat of Mason County; on the Ohio River, and on the Louisville & N. and the Chesapeake & O. R.R.'s; about 63 miles southeast of Cincinnati. The first settlement was made about 1782, and in 1787 it was incorporated by the legislature of Virginia. In 1833 it was granted a city charter. It is in a rich agricultural region, and its facilities for transportation give it considerable commercial importance. Its chief manufacturing establishments are flour and lumber mills, foundries, distilleries, cotton mills, plow and pulley works, boot and shoe factories, tobacco, and furniture. Some of the prominent buildings are the Masonic Temple, the Odd Fellows' Temple, and the Maysville and Mason County Public Library. The library organization was established in 1878. The government of the city is vested in a mayor, who holds office four years, and a council. Pop. (1890) 5,358; (1900) 6,423.

Mazarin, mǎz'a-rīn (Fr. mā-zā-rān), **Jules**, or **Giulio Mazarini**, mǎd-zār-ē'nē, French cardinal and minister of Louis XIV.: b. Piscina, in the Abruzzi, Italy, 14 July 1602; d. Vincennes, 9 March 1661. He was educated at Rome by the Jesuits, thence proceeded to the University of Alcalá in Spain; entered the pope's military service, and distinguished himself by diplomatic ability, for which he was rewarded with two canonicies, and the appointment of nuncio to the court of France (1634-6). Here he gained the favor of Richelieu; accepted service from the king, and became a naturalized citizen of France; was made a cardinal in recognition of his diplomatic services in Savoy; and in 1642, when Richelieu died, promptly succeeded him. On the death of Louis XIII. the queen, Anne of Austria, became regent for her young son, Louis XIV., and it was thought that Mazarin would be dismissed; but instead he gained over the queen-regent, and made himself master of the nation. Two parties in the state rebelled against this usurpation of supreme power by the cardinal. The Parliament of Paris denounced his increasing taxation, while the nobility dreaded his supremacy, and the combination of these malcontents resulted in the civil war of the Fronde (q.v.). As the immediate result of the conflict, Mazarin had twice to leave the court, but through means of intrigue formed a powerful royal party in the state, gained General Turenne to his cause, and finally returned to his position at court in 1653. During the succeeding eight years he remained all-powerful in France; pursued the policy of Richelieu in foreign affairs; made an alliance with Cromwell; brought the Rhine provinces

under the headship of France, and in the treaty of the Pyrenees humiliated Spain, and gained much of French Flanders. In proportion as his foreign policy was successful, his home policy was disastrous. He did nothing for the people but increase their taxes to fill an impoverished exchequer, though he secured the supremacy of the crown over the feudal lords. Consult: Chéruel, 'France sous le Ministère de Mazarin' (1881-2); Mason, 'Mazarin' (1886); Perkins, 'France under Mazarin' (1894).

Mazatlan, mā-sāt-lān', Mexico, a town and seaport about 183 miles southeast of Sinaloa, at the entrance to the Gulf of California. It is built on a hilly crest and has a pleasing appearance. Mazatlan is the chief Pacific port of Mexico, and the outlet for the products of the mining district of Saint Sebastian; it has a considerable import trade. Pop. (1900) 17,400.

Mazdak, mǎz'dāk, Persian religious leader: b. Persepolis about 470 A.D.; d. Nahrwan between 530 and 540. He was a chief priest at Nishapur, and in 500 proclaimed himself a prophet. He converted King Kobad to his views, which forthwith became law. Khosru Nashirvan put him to death.

Maze, **Hippolyte**, ē-pō-lēt mǎz, French historian: b. Arras 5 Nov. 1839; d. Paris 25 Oct. 1891. He studied at the Ecole Normale Supérieure; taught there and at the Lycée Fontanes; was elected prefect of Landes in 1870, deputy in 1879 and 1881, and senator in 1886; and wrote: 'The Republic of the United States: Its Foundation' (1869); 'Hoche in Vendée' (1882); 'The Struggle against Want' (1883); 'General Marceau' (1889); and 'The Generals of the Republic' (1889).

Mazeppa, mā-zēp'ā, **Ivan Stephanovitch**, or **John**, hetman of the Cossacks: b. Podolia about 1645; d. Bender, Bessarabia, 1710. He was page to John Casimir, who was a patron of the arts and of literature, and he had therefore an opportunity of acquiring various useful accomplishments. A Polish nobleman having surprised Mazeppa with his wife, bound him naked upon his own horse, and committed him to his fate. The horse carried him to his own residence. Shame made him flee to the Ukraine and join the Cossacks, whose warlike roving life suited his disposition. He made himself conspicuous by his dexterity, bodily strength, and courage. His knowledge and sagacity procured him the post of secretary to the hetman Samilovitch, and in 1689 he overthrew Samilovitch, and himself became hetman. He gained the confidence of Peter the Great, who loaded him with honors, and he was finally made Prince of the Ukraine. In 1706 he opened negotiations with Charles XII. (q.v.) of Sweden for the purpose of freeing himself from Russian dominion, but his treachery was finally revealed to Peter, and he was obliged openly to declare for Charles. After the defeat of Pultowa, Mazeppa fled to Bender. Lord Byron has made Mazeppa the hero of a poem (1818).

Mazur'ka, a lively Polish national dance, popular also in the United States. The movements are of a grotesque character. The term is also applied to the music which accompanies the dance, sometimes in $\frac{3}{4}$ time, but for the most part in $\frac{3}{4}$. The mazurka is danced by four or eight couples.

Mazzini, Giuseppe, Italian patriot: b. Genoa 28 June 1808; d. Pisa 10 March 1872. He studied law at the University of Genoa, and practised his profession for a time, but he was soon drawn into a political career by his republican sentiments, and the condition of Italy under Austrian rule. His first political essays appeared under the mask of literary critiques in the 'Indicatore Genovese,' which was suppressed when the radicalism of his sentiments was discovered, and revived as the 'Indicatore Livornese,' to be in its turn also soon suppressed. He was an active member of the Carbonari, and while on a mission for that society was arrested and imprisoned for a short time; on his release he went to Marseilles, France, to escape the police surveillance imposed on him in Italy. Here he organized the society known as Young Italy, and established a journal to advocate his views; the purpose of the society was to liberate Italy and establish a national government, Mazzini desiring a republic. He took active part in the organization of an insurrection of which Genoa was to be the centre, but the plot was discovered and failed, and he was sentenced to death. He then went to Switzerland, where he organized another conspiracy for the invasion of Savoy (1834), which also failed. In 1836 he was banished from Switzerland and went to London, where he kept in correspondence with the revolutionary leaders on the Continent, was recognized as the head of the Young Italy party, and instigated several insurrections which were unsuccessful. After the insurrection in Milan in 1848, he again went to Italy, was chosen a member of the provisional government in Tuscany; and in 1849 when Rome was proclaimed a republic became the first of the triumvirs; in June the city was surrendered to the French, and Mazzini escaped to Switzerland and then to London. Later he had a hand in the unsuccessful uprisings at Mantua (1852), in Milan (1853), and in Piedmont (1857), being in Italy for a short time in 1857. He assisted also in organizing the expeditions led by Garibaldi in 1860, 1862 and 1867. An ardent republican, he refused to take his seat in the Italian parliament under the monarchy, though elected from Messina in 1865, as a protest against the uncanceled death sentence against him. In 1866 this sentence was formally rescinded; in 1870 he was arrested under charge of conspiracy with Garibaldi, and imprisoned for two months. Though his actions were sometimes politically indiscreet, he was a man of attractive character and strong personal magnetism, distinguished throughout his career for disinterested patriotism and the highest moral standards of conduct. He was interested in the labor movement, organized a workingmen's association in London in 1840, and was for a time connected with the International Workingmen's Association (q.v.), but withdrew from that society when it declared for socialism. During his later life especially his efforts were directed toward separating republicanism from both socialism and atheism. The best edition of his works is 'Seritti Editi ed Inediti' (1861-74); a partial collection is published under the title 'Life and Writings of Joseph Mazzini' (1891). Consult: 'Memoir of Joseph Mazzini' (1877), containing his two essays, 'Thoughts on Democracy in Europe' and 'On the Duties of Man';

Linton, 'Recollections of Mazzini' (1892); Marriott, 'Makers of Modern Italy' (1889); and Thayer, 'The Dawn of Italian Independence' (1893); Martinengo-Cesaresco, 'Italian Characters.'

Mazzola, māt-sō'lā, or Mazzuoli, māt-soo-ō'lā, Francesco, Italian painter, known from his birthplace as IL PARMIGIANO: b. Parma 11 Jan. 1503; d. Casal Maggiore 24 Aug. 1540. His father and two uncles were painters, and to them and to Correggio, who was in Parma in 1521, he owed his earlier training. Correggio's manner he caught so well that his 'Cupid Fashioning a Bow' was long and generally attributed to Correggio. When 20 he went to Rome and there imitated Raphael and Michelangelo. In 1527, upon the capture of Rome by Charles V., his losses were great and he had to escape from the city. He returned to Parma, lost his health, was imprisoned by the city authorities for failure to complete a commission which had been paid for in advance, and upon his release fled to Casal Maggiore, failing to live up to his promise to repay. His paintings are to be found in most of the galleries of Europe; mention should be made of the 'Madonna with St. Margaret,' in the Bologna Gallery; 'Madonna del Collo Lungo,' Pitti Palace, Florence; 'Annunciation,' Ambrosian Library, Milan; various portraits in the Naples Museum; several sacred subjects, notably 'Madonne' in the Dresden Gallery and in the Louvre; and the great frescoes in the Church of St. John, Parma. More important, though less well known, are Mazzola's etchings, since he introduced etching into Italy. His drawing is correct, and his work bold, fiery and graceful.

Mazzoni, Guido, gwē'dō mat-sō'nē, Italian scholar: b. Florence 12 June 1859. He was educated at Florence, Leghorn, and Bologna, in 1881 became instructor in Italian literature in secondary schools, and in 1887 professor of Italian literature at Padua. His poetic work has been to some extent influenced by his familiarity with English literature and largely by his countryman Carducci. Besides contributions to reviews, he wrote: 'Epigrammi di Meleagro da Cadora' (1880); 'In Biblioteca' (1882); 'Esperimenti metrici' (1882); 'Un Ritratto di Gesù' (1887); 'Rassegne litterarie' (1887); 'Fra Libri et Carte' (1887); and other works.

Mead, mēd, Charles Marsh, American Congregational clergyman: b. Cornwall, Vt., 28 Jan. 1836. He was graduated from the Andover Theological Seminary in 1862, studied in Germany and was ordained to the ministry in 1866. From 1866-82 he was professor of Hebrew at Andover, and for the succeeding 10 years lived in Germany as a member of the American Bible Revision Committee. He returned to the United States in 1892 and until 1898 was professor of theology at Hartford Theological Seminary. He has published: 'The Soul Here and Hereafter' (1879); 'Romans Dissected' (1891); 'Christ and Criticism' (1893); etc.

Mead, Edwin Doak, American author and lecturer: b. Chesterfield, N. H., 29 Sept. 1849. His early life was spent on his father's farm, and in 1866 he entered a publishing house in Boston. He studied in English and German universities 1875-9, and has since engaged in

MEAD — MEADE

lecturing and writing. In 1880 he was associate editor of the 'New England Magazine' with Edward Everett Hale, and chief editor 1890-1901. He is connected with numerous historical and social clubs, and has written: 'The Philosophy of Carlyle' (1881); 'Martin Luther — a Study of Reformation' (1884); 'A More Beautiful Public Life' (1894); etc.

Mead, Larkin Goldsmith, American sculptor: b. Chesterfield, N. H., 3 Jan. 1835. He was educated in the public schools and studied art in Brooklyn and Italy, where in Venice he was a member of the United States consulate. His first work was an ideal figure, 'The Recording Angel,' executed in 1855. He served for a time in the Civil War as illustrator for 'Harper's Weekly,' and since the war his work as a sculptor has given him national prominence. The statue of Lincoln on the monument at Springfield, Ill., is his work, as are the bronze statues of Ethan Allen at the Capitol in Washington and in Montpelier, Vt. His work includes many ideal pieces: 'The Returned Soldier'; 'The Return of Proserpine from the Realm of Pluto' (exhibited at the World's Columbian Exposition); etc.

Mead, Lucia Ames, American author: b. Boscawen, N. H., 5 May 1856. She is a lecturer and writer on social and economic questions, an advocate of advanced movements generally including woman's suffrage. She was married in 1898 to Edwin D. Mead (q.v.), is prominently connected with various clubs and has written: 'Memoirs of a Millionaire' (1890); 'To Whom Much is Given' (1898); 'Milton's England' (1902); etc.

Mead, William Rutherford, American architect: b. Brattleboro, Vt., 20 Aug. 1846. He was graduated from Amherst College in 1867, studied architecture in New York and Europe, and upon his return to the United States became a member of the prominent New York firm of McKim, Mead and White, which has had charge of many of the most important public and private buildings in the country. He is a brother of L. G. Mead (q.v.).

Mead, or Meth, a vinous liquor, used in northern Europe and made of honey and water by means of digestion and fermentation. It also receives an addition of fruit, spices and simples to give it a richer flavor. When new, mead has always a strong taste of honey, but this diminishes as it becomes older. Mead is mixed with the must of apples, or with wine, beer, and even vinegar, and then takes the name of wine-mead, beer-mead, etc.

Meade, mēd, Elizabeth Thomasina, English novelist: b. Bandon, County Cork. Her literary career began at 17, and later she went to London, where she was employed in the British Museum. She was married in 1879 to Alfred Toulminsmith, but continued her literary work, and for six years edited 'Atalanta,' a magazine for young people. Among her books are: 'Scamp and I'; 'The Way of a Woman'; 'The Cleverest Woman in London' (1898); 'Drift'; 'All Sorts'; etc.

Meade, George Gordon, American soldier: b. Cadiz, Spain, 31 Dec. 1815; d. Philadelphia 6 Nov. 1872. In 1835 he was graduated from the United States Military Academy and assigned to the 3d artillery, in 1835-6 served in the Semi-

nole war in Florida, on 26 Oct. 1836 resigned from the army, and in 1836-7 was assistant engineer in the construction of the Alabama, Florida and Georgia railway. He was later employed in various works of engineering, including surveys of the mouths of the Mississippi and of the northeast boundary between the United States and British North America. On 19 May 1842 re-entered the army as 2d lieutenant of topographical engineers. He joined Scott's staff at Corpus Christi, Tex., 14 Sept. 1845, and during the Mexican War participated in the battles of Palo Alto, Monterey, and Resaca de la Palma, and the siege of Vera Cruz. After the war he was occupied in light-house construction and in the geodetic survey of the Great Lakes (1857-61). He became captain in the corps of engineers in 1856. On 31 Aug. 1861 he was commissioned brigadier-general of volunteers, and assigned to the command of the 2d brigade of the Pennsylvania reserve corps of the army of the Potomac, stationed on the right of the lines before Washington. He served in the Virginia peninsula campaign, and took part in the actions at Mechanicsville (26 June), Gaines' Mill (27 June), and Frayser's Farm (30 June). On 18 June he was promoted major of engineers. At Manassas (second Bull Run), he commanded the 1st brigade of Reynolds' division; and later he took a distinguished part at South Mountain (14 Sept.) and Antietam (17 Sept.). In the latter battle, when Hooker was wounded, he was placed in command of the First corps. For his services he was promoted major-general of volunteers 29 Nov. 1862; and at Fredericksburg (13 Dec.) commanded the 3d division of the First corps, with which he broke through Lee's right and penetrated to the position occupied by the Confederate reserves, but for want of support was compelled to fall back. At Chancellorsville (2-4 May 1863) he commanded the Fifth corps. On 28 June 1863 he was appointed commander of the army of the Potomac, to succeed Hooker. His command was then scattered, and on the march through Pennsylvania in pursuit of the Confederate invaders. Meade had everything yet to learn of both his own force and the enemy. At Gettysburg on 1-3 July he won the great and decisive battle with which his name is generally associated. (See GETTYSBURG, BATTLE OF.) He received the thanks of Congress and was made brigadier-general, U. S. A., 3 July 1863. During the remainder of the war he commanded the army of the Potomac with conspicuous ability, and on 18 Aug. 1864 became major-general in the regular army. From 1 July 1865 until his death he was commander of the military division of the Atlantic, with the exception of the period January 1868-March 1869, when he was in command successively of the third military district and the department of the South. He was a fellow of the American Academy of Arts and Sciences. There is an equestrian statue of him by Cadden in Fairmount Park, Philadelphia, and one by Bush-Brown on the field of Gettysburg. Consult: Baché, 'Life of General G. G. Meade' (1897); Pennypacker, 'General Meade' (1901).

Meade, L. T. See MEADE, ELIZABETH THOMASINA

Meade, Richard Kidder, American soldier: b. Nansemond County, Va., 14 July 1746; d.

MEADE — MEADOW-LARK

Frederic, now Clarke County, after 1800. He was educated in England at Harrow and in private schools. He had returned from England some years before the outbreak of the Revolution, and in 1775 entered the service of the struggling colonies, and distinguished himself in his first battle, that at Great Bridge. Recognition came speedily with an appointment to the staff of General Washington, with whom he remained until the close of the war. The supervision of the execution of Major André fell to his lot, a duty which while recognizing the necessity for it, he performed with deep regret. At the conclusion of the war he returned to Virginia to engage in the quiet life of the plantation.

Meade, Richard Worsam, American naval officer: b. New York 9 Oct. 1837; d. Washington, D. C., 4 May 1897. He was a nephew of General G. G. Meade (q.v.). He entered the navy as midshipman 2 Oct. 1850. His promotions were: lieutenant 23 Jan. 1858; lieutenant-commander 16 July 1862; commander 20 Sept. 1868; captain 13 March 1880; commodore 5 May 1892; and rear-admiral 7 Sept. 1894. On 20 May 1895 he was retired from the service. He was naval representative of the United States at the World's Columbian Exposition, Chicago, 1893. He published 'A Treatise on Naval Architecture and Ship-building' (1869).

Meade, William, American Protestant Episcopal bishop: b. near Millwood, Va., 11 Nov. 1789; d. Richmond, Va., 14 March 1862. He was a son of R. K. Meade (q.v.), and was graduated from Princeton College in 1808, studied theology, and took orders in the Episcopal ministry in 1811. His first charge was his home parish, which he served gratuitously, and in 1829 he was elected assistant to Bishop Moore. He was in charge of Christ Church in Norfolk, Va., in 1834-6, and in 1841 succeeded Bishop Moore as head of the diocese of Virginia. He was one of the founders in 1847 of the 'Evangelical Knowledge Society' and was the author of several works, among which are: 'Family Prayers' (1834); 'Reasons for Loving the Episcopal Church' (1852); 'The Bible and the Classics' (1861).

Meadow, Making and Care of. Meadows may be divided into general groups which will depend upon location, duration, and purpose, and their treatment will vary with each of these factors. Meadows located upon low ground, which may be inundated, or which is constantly moist, usually consist of grasses and other plants which do not thrive so well upon upland fields. Because of their dampness they cannot be treated like dry soils, and they are therefore more frequently permanent than temporary. Further, they are generally better adapted for haying than for grazing, because the grasses that naturally grow upon them are ranker, taller growing species and generally have grown to a considerable height before the land becomes dry enough to turn stock upon it. Except as to season the preparation of lowland meadows is not necessarily different from that of upland.

For best results the land should be deeply plowed as early in the season as soil conditions will permit, and harrowed at intervals of 10 days and after each rain that forms a crust until late summer. The practice will not only destroy weeds and weed seeds, but insure the

quick germination of grass seed sown even in dry weather, the soil being moist close to the surface. The soil may be anything, but preferably not sand or clay. If mucky, as in a reclaimed swamp, rolling is frequently advisable, otherwise generally not. Prior to plowing liberal applications of good manure or commercial fertilizers should be made and light annual dressings should also be given, preferably in autumn or early spring. Temporary pastures which are intended to last only three or four years should constitute part of a general rotation scheme (see ROTATION OF CROPS) and should be followed by some crop such as corn or potatoes, which can best utilize their products of decomposition. Permanent meadows should be inspected each spring and the spots which appear to be failing given special attention, such as fertilizing, liming, seeding, etc., to maintain a general good average. When the annual yield of hay falls below two tons the meadow may be considered unprofitable and should be plowed up and given a change of crop for three or four years.

In general, timothy or "herd's-grass" is the most popular grass in America, because it is hardy, long-lived, large, easily cured, and its seed inexpensive and likely to be free from weed seed. Orchard grass, tall meadow fescue, red-top, ryegrass and cat-grass are also often used, but are secondary. Blue-grass, which generally appears as a volunteer grass in permanent meadows, is rarely profitable as a hay grass, but is unequaled in the North as a pasture grass. These grasses may all be sown with a sparsely planted cereal which acts as a "nurse crop." But this practice is generally considered inexpedient. The admixture of clover, however, is generally highly desirable, since the clovers supply nitrogenous food to the grasses. Alsike clover is considered best for mixing with timothy since it is somewhat later in ripening than the other large clovers, which mature before the timothy can be profitably cut.

Meadow-beauty. See DEER-GRASS.

Meadow Fescue, a fescue-grass (*Festuca*). See GRASSES IN THE UNITED STATES.

Meadow Grass. See BLUE GRASS.

Meadow-hen, the American coot. See COOT.

Meadow-lark, or **Medlark**, a beautiful American starling (*Sturnella magna*), numerous in eastern United States as far west as the high central plains, where it is replaced by a variety (*neglecta*) remarkably different in song and some habits. It is about 11 inches long, and the tail 5 inches. The body is thick and stout, the legs large, the bill long and straight, and the flight powerful. The upper parts are brown, marked with brownish-white, and the exposed portions of the wings and tail with transverse dark-brown bars; the under parts yellow, with a black crescent upon the breast, which is very distinctive as well as a handsome ornament. These birds receive their popular name "lark" from their terrestrial habits and way of singing in the air, uttering a loud sweet double call while circling upon fluttering wings above the meadow or grain-field where the nest is carefully concealed among the roots of the grasses. The eggs are white, profusely speckled with light red. The western variety has a longer,

MEADOW-MOUSE — MEAL-TUB PLOT

more vivacious and tuneful song than the eastern bird, and is justly accounted the finest songster of the open regions of the interior. These birds are migratory in the northern parts of their range, but most of them remain during the winter in the middle parts of the United States and southward, and in the autumn are often shot for market. In the Southern States it is commonly called "old-field lark."

Meadow-mouse. See FIELD-MICE.

Meadow-pink, or Meadow-campion, the common cuckoo-flower (q.v.), or ragged robin (*Lychnis flos-cuculi*). See LYCHNIS.

Meadow-rue, a plant of the crowfoot family and of the genus *Thalictrum*. These ruees are erect perennial herbs, with small deeply cut leaves, and pretty flowers, usually in loose panicles. The genus contains about 75 species, scattered about the north temperate zone, of which the United States and Canada possess about 15 species, some of which are well-known. The early meadow-rue (*T. dioicum*) is a slender, leafy species, of rocky woods, a foot or two in height, whose flowers, purplish and greenish with yellowish antlers, appear in April or May. The purple meadow-rue (*T. purpurascens*), common in New England woods, is distinguishable by its size (2 to 4 feet tall), large, bright-green, waxy leaves and purplish stem; the flowers form a greenish fleecy bloom. A third large species is the thick-leaved (*T. coriaceum*) of the Southern States, whose flowers are of different hues, the staminate flowers being white and showy, while the pistillate flowers, borne on separate plants, are purplish. The tall meadow-rue (*T. polygonum*), towers to a height of 12 feet in favorable situations. All are fertilized mainly by the wind.

Meadow-snipe. See JACK-SNIPES.

Meadowsweet, a well-known handsome European plant (*Spiraea ulmaria*) of the rose family. It grows by the sides of streams and in damp places, has pinnate leaves, and stems two feet high bearing corymbs of white fragrant flowers. A decoction of it with copperas is used for dyeing black, and the root has been used as a tonic. It is also called queen of the meadow.

Meadville, mēd'vil, Pa., city, county-seat of Crawford County; on French Creek, and on the Erie and a branch of the Pittsburg, B. & L. E. R.R.'s; about 90 miles north of Pittsburg and 30 miles south of Erie. The first settlement was made in May 1788 by David Mead and others. It became a borough in 1823, and in 1866 was chartered as a city. It is in a fertile agricultural region, in the vicinity of extensive oil fields, and in the part of the State noted for its iron and steel industries. The chief manufacturing establishments are the Erie railroad shops, with nearly 2,000 employees; the Phoenix iron works, and the Meadville malleable iron works, with 500 employees; the Keystone vise works, with 250 employees; chocolate chips factory, with 150 employees; Barbour silk mills, 120 employees; shoe-button fastener works, silk mills, printing works, confectionery factories, engine works, and other manufactories employing over 500 persons. The city has 20 churches, an academy of music, court-house, three parks, the county fair ground, a race track, three iron bridges, and several fine wholesale and retail buildings. Its educational institutions are the

public and parish schools, a high school, the Meadville Theological School, opened in 1844 by the Unitarians; Allegheny College, opened in 1815 by the Methodist Episcopal; Pennsylvania College of Music, Meadville Business College, and a public library. There are the City Hospital and Saint Joseph's Hospital. The three banks have a combined capital of \$350,000. The government is vested in a mayor, who holds office three years, and a council. The charter of 1889 is in accordance with the general State law for establishment of cities. The electric-light plant and the waterworks are owned and operated by the city. Pop. (1900) 10,291.

WALTER IRVING BATES,
Editor of 'Tribune-Republican.'

Meagher, mā'hēr, **Thomas Francis,** Irish-American soldier: b. Waterford, Ireland, 3 Aug. 1823; d. near Fort Benton, Mont., 1 July 1867. He was educated at the Jesuit College, Clongowes Wood, Kildare, and at Stonyhurst College (near Preston), England; became one of the principal orators of the Young Ireland party, which aimed at independence through armed revolution; in 1848 was sent on a mission by the Irish Confederation to the French provisional government; and on 21 March was arrested on a charge of sedition. He was bailed, but on the passage of the treason-felony act re-arrested; and in October sentenced to death for treason. The sentence having been commuted to life banishment, he was removed to Tasmania (9 July 1849); but in 1852 escaped to the United States, where he was admitted to the bar in 1850 and practised in New York in 1856-61. In 1861 he organized a company of zouaves for the Federal army, with which he joined the 60th New York volunteers, under command of Colonel Michael Corcoran. After three months' service, he recruited the "Irish brigade" (1861-2), and was elected colonel of the 1st regiment. On 3 Feb. 1862 he became brigadier-general and took command of the brigade. He fought bravely at Richmond, the second Bull Run, Fredericksburg, and Antietam, and Fredericksburg, and after Chancellorsville found his command so reduced in numbers that he resigned. Early in 1864 he was reappointed brigadier-general of volunteers, and was assigned to the command of the military district of Etowah. He resigned 15 May 1865, was appointed secretary of Montana territory, and acted at one time as governor *pro tem*. He wrote 'Speeches on the Legislative Independence of Ireland' (1852).

Meagre. A fish. See MAIGRE.

Meakin, mē'kin, **Budgett,** English author and writer: b. Ealing Park, England, 8 Aug. 1866. He was educated at the Reigate Grammar School, became associate editor of 'Times' of Morocco, and was editor 1884-93. He has spent years in the study of social conditions, traveling in almost every portion of the world and has lectured extensively on industrial questions and on Oriental subjects, chiefly in England and America. Among his works are: 'The Moorish Empire' (1899); 'The Land of the Moors' (1901); 'The Moors' (1902); etc.

Meal-moth; Meal-worm. See FLOUR INSECTS.

Meal-tub Plot, in English history, an alleged conspiracy, concocted in 1679 by an in-

MEALY-BUG — MEARIM RIVER

former, Dangerfield, with the view of cutting off those who were opposed to the succession of James II. after he had embraced Roman Catholicism. The false charges to which Dangerfield was prepared to swear were found in the meal-tub belonging to a Mrs. Cellier, one of his friends. Ultimately he confessed his crime, was whipped, and condemned to stand in the pillory.

Mealy-bug, a scaleless scale insect of the genus *Dactylopius* and family *Coccida*. These insects are covered with a mealy, or waxy substance which they secrete for protective purposes. Like their relatives, the true scale insects, they also secrete honey-dew and are attended and transported by ants; unlike these relatives they do not lose the power of locomotion. The species are most numerous in tropical and sub-tropical countries; one species (*D. citri*) being the best known outdoor species in the United States, feeding upon citrus trees in Florida. In greenhouses another species (*D. destructor*) is often troublesome. Owing to the protective covering difficulty has been met in ridding plants of these creatures, but fumigation and caustic solutions have been tried with most satisfactory results. See INSECTICIDE.

Mealy Wing, a minute bug of the family *Aleyrodidae*, whose species (about 150 in number) have the wings covered with a white meal-like secretion. They are allied to the coccids, but differ in development and structural peculiarities; and throng upon the leaves of plants which they injure by sucking away the sap and also by attracting a growth of smut-fungus by their secretion of honey-dew. In this manner they blacken and harm orange and lemon trees in parts of Florida and Louisiana, where they are prevalent. Consult Howard, 'Insect Book' (1901).

Mean Value. If n quantities are commensurable, the sum of their units divided by n , the number of the quantities, is the *arithmetical mean* and is the *mean value* of the n quantities when their number is finite. For example, if the number of units in three quantities are respectively four, eight, and fifteen, the mean value is $\frac{4+8+15}{3} = 9$; and in general, if the

number of units in n quantities is denoted by $X_1, X_2, X_3, \dots, X_n$, the mean value is

$$M = \frac{1}{n} (X_1 + X_2 + X_3 + \dots + X_n).$$

But if a quantity varies continuously in accordance with some law, thereby assuming every possible value between two extremes, the number of different quantities is infinite, and the mean value in such a case requires a new definition. For example, assume that at every point in the diameter of a semicircle a perpendicular to the diameter is drawn to meet the semicircle. The lengths of these lines form a continuous series of values represented by every number from zero to r , where r is the length of the radius. In such a case if the n values of the perpendiculars are obtained and their sum is divided by n , the ratio would approximate to the mean value. But the limit of this ratio, as n is increased indefinitely, would be the mean value. It follows that the mean value will depend upon the law according to which the n values are selected. That is, the mean value of a continuously varying quantity is not definite

until the law that governs the succession of values is known.

The several forms of the theorem that pass under the name of the mean value theorem involve the principles of the infinitesimal calculus. The *first theorem of the mean value* is the following: Let $f(x)$ denote any finite and continuous function of x in the interval between $x = x_0$ and $x = X$; let dx denote the increment and retain the same sign in this interval; and assume that m and M are respectively the least and the greatest values of $f(x)$ in this interval: then the definite integral $\int_{x_0}^X f(x) dx$ has a definite value that is greater than $m(X - x_0)$ and less than $M(X - x_0)$; that is:

$$m \int_{x_0}^X dx < \int_{x_0}^X f(x) dx < M \int_{x_0}^X dx.$$

Since $f(x)$ is continuous in the interval $X - x_0$, there must be a value $x = \xi$, where $x_0 < \xi < X$ such that $\int_{x_0}^X f(x) dx = (X - x_0)f(\xi)$,

$m < f(\xi) < M$. The value, $f(\xi) = \frac{1}{X - x_0} \int_{x_0}^X f(x) dx$, is called the *mean value* of $f(x)$ in the interval $X - x_0$. If we assume $F(x)$ to be the primitive or indefinite integral of $f(x)$, then $F(X) - F(x_0) = (X - x_0)f(\xi) = (X - x_0)F'(\xi)$ which is the familiar form of the law of the mean in the differential calculus.

For the extensions of the mean value theorem due to Lagrange, Cauchy and Schlömilch and Roche, which lie at the basis of Taylor's theorem, see SERIES. Reference may be had to William's 'Integral Calculus' for further illustrations and extension of the theorem to include functions of two or more variables.

Meander, mē-än'dër, in art, an ornamental design, in which the lines interlace; it is often used in decorating vases.

Means, mēnz, **David MacGregor**, American lawyer and author: b. Groton, Mass., 1 May 1847. He was graduated from Yale in 1868, studied theology at Andover and New Haven, was professor of economics in Middlebury (Vt.) College in 1877-80, and in 1881 was admitted to the bar and entered the practice of law. He contributed to periodicals, and wrote 'The Boss' (1894); and 'Industrial Freedom' (1897).

Means Grass. See GRASSES IN THE UNITED STATES.

Meares, mērz, **John**, English navigator: b. England 1756; d. London 1809. He entered upon a seafaring life at an early age and in 1776 he entered the navy and served in the war with the French until peace was declared in 1783, when he became a captain in the merchant service. In 1786 he explored the coast of Alaska and made in 1789 a second tour of exploration on the discoveries of which the British government based its claim to the possession of British Columbia and Oregon. He was the author of 'Voyages in the Years 1788-9, from China to the Northwest Coast of America' (1790).

Mearim River, Brazil, rises in the Serra do Negro, and after a northerly course of about 360 miles in the state of Maranhão, flows into the Bay of São Marcos near the city of Maranhão. It has numerous affluents, and is navigable, but the sudden tidal bores are dangerous.

MEARS — MEASUREMENT OF STREAMS

Mears, Mary M., American author: b. Oshkosh, Wis., 2 Jan. 1871. She was educated at the State Normal School in Oshkosh and first became known to the reading public in 1896, when her work appeared in the magazines and speedily made her popular as a writer of short stories. She has traveled in Europe in search of literary materials and has published, under the pen-name "GEORGE MADDEN MARTIN," 'Emmy Lou—Her Book.'

Measles (also called RUBEOLA and MORBILLI), a communicable or infectious eruptive disease, one of the exanthemata, frequently epidemic, and sometimes dangerous because of its debilitating effects and tendency to end in inflammation of mucous membranes, such as pneumonia and enteritis. So-called black or malignant measles, occurring mostly in persons of very poor health, is usually fatal. Although measles is a disease of childhood, adults are not exempt from it. As a rule it attacks an individual but once. The contagious principle exists in the breath and in exhalations from the skin, the tears, the nasal and bronchial secretions, and the excretions. Clothing which has been in an infected atmosphere is liable to spread the disease. How long the contagium remains in infected articles is not known. The disease may be divided into four stages, beginning with the stage of incubation, or the interval (varying from 7 to 21 days) between the date of infection and the outbreak of symptoms, that is, the stage of invasion. The symptoms are chilliness, fever, pain in head, back, and limbs, bloodshot eyes, with intolerance of light, running of the eyes and nose, sneezing, and a troublesome cough. About the fourth day an eruption or rash appears (stage of eruption), first in the throat, then upon the face, trunk, and extremities, as minute pinkish red spots, which coalesce into blotches more or less crescentic in shape, raised above the surface of the skin. The eruption usually lasts about three or four days. Gradually disappearing (stage of decline), fever and catarrhal symptoms abate, and appetite returns. The cough may remain for days. The patient should be kept in a warm, well ventilated, and fairly lighted room, should be given easily digested food and plenty of water. Treatment should also regulate the bowels with saline medicines, and allay the severity of the cough with simple remedies. Severe symptoms require the attendance of the physician. Measles is contagious until the eruption has disappeared and all dead particles of skin have come away of themselves, or have been washed off by tepid baths.

Measure, a definite unit of capacity or extent, fixed by law or custom, by which relative sizes and capacities are ascertained and expressed; as, a yard, a measure of length; a gallon, a measure of capacity; a square foot, a measure of area; a cubic foot, a measure of volume, etc. See WEIGHTS AND MEASURES.

Lineal Measure.—The measure of lines or distances; the standard unit of lineal measure in the United States is the yard. The system is based on the law of nature that the force of gravity is constant at the same point of the earth's surface, and consequently that the length of a pendulum which oscillates a certain number of times in a given period is also constant.

Unit of Measure.—A given quantity, used as

a standard of comparison in measuring a quantity of the same kind. Every kind of quantity has its own unit of measure, and under different circumstances the same kind of quantity may have different units of measure.

Line of Measures.—The line of intersection of the primitive plane, with a plane passing through the axis of the primitive circle and the axis of the circle to be projected.

Measure of Angles.—The right angle being taken as the angular unit, its subdivisions are degrees, minutes and seconds. The right angle contains 90 degrees, the degree 60 minutes, and the minute 60 seconds. All smaller fractions are expressed decimally in terms of the second.

Measure of Magnification.—The measure of magnification, or magnifying power of any optical instrument, is the ratio of the magnitude of the image to the magnitude of the object, or more precisely, the ratio of the apparent diameter of the image to that of the object.

Measure of a Ratio.—Its logarithm, in any system of logarithms, or the exponent of the power to which the ratio is equal, the exponent of some given ratio being assumed as unity.

In Music.—The quantity of notes which are placed in the bar, and which is generally called the time, of which there are but two kinds, namely, common time, containing an equal quantity of notes in the bar, and triple time, containing an unequal quantity. Common time is generally marked with a C at the beginning, which means that every bar contains four crotchets, or their value in other notes. There are also other kinds of common time which are marked $\frac{3}{4}$, $\frac{2}{4}$, $\frac{3}{8}$. Triple time is marked $\frac{3}{8}$, $\frac{3}{4}$, $\frac{3}{8}$, $\frac{3}{4}$, $\frac{3}{8}$.

Measure For Measure, a tragi-comedy by Shakespeare, first acted in 1604, and appearing first in print in the 'First Folio' of 1623. The outline of the plot is taken from the Italian novelist Cinthio, and from Whetstone's tragedy of 'Promos and Cassandra.' In 1662 an adaptation of the play, entitled 'Laws against Lovers,' was made by Davenant. Both Benedick and Beatrice appear in Davenant's version. A second adaptation, by Gildon, was produced in 1700 with the title, 'Beauty the Best Advocate.'

Measurement of Ships for Tonnage, or Builder's Measurement, a method of computing the tonnage of merchant vessels, in use among shipbuilders. Its results are nearly double the legal or registered tonnage. See TONNAGE.

Measurement of Streams. One of the many useful classes of work conducted by the United States Geological Survey; the measurement of streams having an industrial value. Wherever water is likely to be employed for power or irrigation the amount available is ascertained by that bureau. The volume varies greatly from season to season, and sometimes from year to year. Any calculation by the manufacturer or farmer which does not take this variability into account would be misleading. Moreover, streams differ among themselves in straightness, the character of their beds and other particulars. Accurate measurement is still further complicated by the lack of uniformity in the movement in a given cross section. What might be true for one point would not be true for other points to the right or left of it, or at a higher or lower level.

MEASURING WORM — MEATS AND MEAT PRODUCTION

The first step in the work is to place a gauge in a permanent position, and employ a suitable observer to read it every day. The gauge is graduated to feet and tenths. Usually it is upright. It may be laid over slanting, however. In that case, the spacing is widened, so as to give accurate results. One observation a day is made, and its result is transmitted on a postal card to Washington. The second factor in the hydrographer's computation is the velocity of the stream, at different heights. To ascertain this only occasional measurements are necessary. These are made by experts, but with their aid it is possible to prepare tables showing the total discharge of that particular stream for all the different gauge readings. After such tabulation is effected the maximum, minimum and mean flow for any month in the year can be told at a glance.

Velocity is ascertained with a meter lowered into the water. The instrument contains a tiny screw propeller, the number of whose rotations under the pressure of the fluid is automatically registered. Many types of meter have been devised. The kind which the bureau prefers has an electric wire leading up to a buzzer in the operator's pocket. There a click or other audible sound indicates to him the speed of the screw. He counts the number of revolutions for some definite period, usually fifty seconds, records it in his notebook, and moves along a short distance to make another observation.

If measurements are made at various depths along a vertical line, the results will not be equal. For this reason hydrographers have studied to find, if possible, a level that would fairly represent the average velocity for any vertical. In this way they can simplify the labor. It has been found that such an average can be secured by taking the speed at a depth of from six tenths to two thirds of the way down from the surface. To obtain a correct idea for the whole stream, though, these tests must be made at a number of places between one shore and the other. No measurement at a single point can be trusted to be fairly representative.

Measuring Worm, Inch Worm, Looper, or Span-worm, a caterpillar of any species of moth of the superfamily *Geometridæ*. The creatures are characterized by the presence of only two pairs of abdominal legs, one upon the ninth, the other upon the anal segment, and by their peculiar form of locomotion, the rear of the body being brought forward toward the front legs and the body forming a loop at right angles to the surface upon which the insects walk. Nearly all the numerous species feed upon foliage, a few upon seeds in which they bore. Some are considered serious pests in orchards and upon shade trees; for instance, the canker worms (see **APPLE**, paragraph *Insects*), the lime-tree moth (*Hybernia tilia*), and *Cymatophora pampinaria*, which sometimes devastates cranberry plantations. Most of the species, however, are of small economic importance. The caterpillars usually resemble twigs when at rest, their protective coloring and their attitudes serving to deceive their enemies. The caterpillars of a few species of the owl-moths, family *Noctuidæ*, walk in this way, since they also lack prolegs upon the middle abdominal segments. They are not, however, considered

true measuring worms. The geometrid moths are usually of small size and inconspicuous but delicate and beautiful coloration. Consult Holland, 'The Moth Book' (New York, 1903); and Packard's 'Monograph of the Geometridæ,' with colored plates, published by the U. S. Geological Survey in 1876.

Meat Extract, or juice of meat, has become since its introduction by Liebig (q.v.), a subject of great importance in medicine, dietetics and commerce. The chemical constituents of meat juice are not clearly established, although creatine, sarcine and inosinic acid are among the substances intelligently investigated. Phosphoric and hydrochloric acids and inorganic salts, with some coagulable ingredients are among the constituents. Beef tea while of value does not furnish complete food either for sickness or health.

Meats and Meat Production. The discussion of the subject will be confined to a consideration of the properties, use and production of the flesh of cattle, sheep and swine for human food. All organic matter is made up of dry substance and water. The per cent of water in meats varies from 10 to 78. Moisture in meat or other foods aids in the various processes of digestion, especially in mastication. It also assists in the assimilation of foods. The two things which appear to have the greatest influence upon the percentage of water in meat are the age and condition of the animal. Other things being equal, the younger the animal the more water its flesh contains, while the higher the percentage of fat in meat the lower the percentage of water. From 50 to 65 per cent of the fat steer is meat. The remainder is made up of by-products, in general, such as hides, fat, offal, etc., less valuable than beef. A physical examination of meats shows them to be made up of muscular tissue or lean meat, fatty tissue or fats, connective tissue or the gristle, and bone. From the standpoint of the nutritive value of meat, gristle and bone are practically refuse.

Composition.—Chemically, meat is composed of proteids, fats, water, ash, and carbohydrates, which are the necessary food constituents for the production of energy and repair of the animal body. The amount of carbohydrates is so small as to make it almost a negligible factor. Extractives are also present in meats which are believed to be responsible for meat flavors. While differences in the chemical composition of two cuts of meat are not necessarily an indication of their relative food value, yet the composition of meats in general is important as indicating their place in the diet of man. Lean meat contains from 15 to 21 per cent proteid; whole eggs, 12.5 per cent; fresh, whole milk, 3.4, and cheese from 25 to 30 per cent. Fresh vegetables, other than peas and beans, contain 0.5 to 3 per cent proteid; fresh peas and beans, 12.5 per cent; wheat flour, 10 to 12 per cent, and dry peas and beans 25 to 30 per cent. Thus it will be seen that meat contains a relatively high percentage of proteid, a most necessary food constituent, and one which is generally found in too limited quantities in human food. Good authorities agree that the supply of protein should be abundant, since as far as is known it is the only source of bodily repair. Protein may take the place of carbohydrates and

MEATS AND MEAT PRODUCTION

fats in animal nutrition to a limited extent, but carbohydrates and fats cannot take the place of protein. The mineral matter comprising the ash of meats is made up chiefly of calcium phosphate and potassium phosphate. The percentage of ash in fresh edible meats varies from 0.5 to 1.5. Meat sugar comprising about 0.5 per cent of meats figures but insignificantly as a carbohydrate. The percentage of proteids is the least variable of any of the constituents of meat. The necessity of proteids is understood when we conceive that the body is made up of 50 per cent muscle and that one third of the muscle is protein. Good authorities agree that at least one third of the proteids required by the body should be furnished by animal products.

Nutrition.—From one tenth to one third the cost of food in the average family is paid out for meats. Some facts are given therefore which throw some light on the question as to the desirable qualities of beef. Beef is used to illustrate the matter of quality because it is pre-eminently the most popular flesh food and because quality means more in beef than in mutton or pork, especially the latter. If all the desirable qualities of beef could be secured in one cut it would be palatable, nutritious, and economical. This is practically impossible, however; there are wider differences in cuts of meat as to palatability and cost than as to food value, while the less expensive cuts may be rendered more palatable by proper methods of cooking. Palatability of beef depends upon tenderness, juiciness, quality and flavor. Tenderness, juiciness, quality and flavor depend upon the age of the animal, the location of the cut, the condition of the animal as to ripeness, the degree of ripeness of the meat and the method of cooking. As a rule the younger the animal the more tender the meat. Perhaps nothing, however, has more influence upon tenderness than cooking,—different cuts requiring different treatment. The flesh of young animals invariably lacks that fine marbled appearance, or distribution of fat throughout the muscular tissue that is so characteristic of beef of high quality taken from mature bullocks that are in a finished or well fattened condition. The beef of young cattle is also more or less lacking in flavor. Satisfactory flavor in beef is of course largely a matter of individual preference, but a reasonable state of maturity and development is required to give beef its most characteristic flavor. It is significant that the more tender cuts of beef, such as the tenderloin, lack noticeably in flavor. Good judges agree that the best flavored beef comes from muscles which are frequently used during the life of the animal. This exercise renders these muscles tougher, but of distinctly higher flavor. Beef cut from cattle of rather advanced age or for that matter from cattle of any age, is rendered relatively more tender by the ripening process. Fresh beef that has not hung in the cooler for ten days to two weeks lacks both in tenderness and flavor. Even a longer time in cold storage is desirable with the highest grade of beef. The beef cut from well fattened steers of good quality or containing a high percentage of beef blood can be much more satisfactorily ripened in cold storage than that cut from mongrel bred steers which have been slaughtered in an indifferent condition. Carcasses of prime steers pos-

sess a characteristic coating of surface fat which protects the lean beef from too much exposure and gives it an opportunity to fully ripen. In the case of the carcass from the medium and common grades the beef frequently lacks that surface fat which seems to serve such a useful office during the ripening process. Low grade beef will literally rot before it will ripen. Juiciness in beef is largely dependent upon the percentage and distribution of fat, and the method of cooking. While an abundance of fat anywhere on a cut of beef adds materially to its apparent juiciness, an even distribution of fat throughout the muscular tissue, a condition which gives to the meat when carved (especially when cold) that beautifully marbled appearance, is the leading factor in contributing ideal juiciness to the beef. Juiciness may be easily destroyed by too prolonged roasting or broiling. The marbled quality in beef is seldom seen except in reasonably mature, well fattened cattle.

Prime condition in the live animal is essential for producing high quality in beef and other meats as well. In order to secure the highest quality in meats the consumer must pay a relatively high price for the cuts of meat or buy considerably more fat than can be agreeably eaten along with the lean of the cut, thus making it necessary to utilize the superfluous fat for other purposes or consider it as waste or refuse. In either instance it renders the edible meat of high quality relatively high priced as compared with low grade meat. On the other hand, meat of high quality need not necessarily be the most expensive for the consumer to purchase, for, when properly cooked, it is so delightfully tender and juicy that all of it is edible, save possibly a small amount of superfluous fat. However, this extra fat is of such quality that it can be readily rendered and used for cooking purposes to supplement or in some instances satisfactorily take the place of more expensive shortening. Another fact which should not be overlooked is that the cheaper, and as generally considered, less palatable cuts taken from a carcass of beef possessing high quality are often fully as desirable as the best cuts from low grade carcasses.

Packing.—The packer or slaughterer of meats is willing to pay a premium for animals in prime or well fattened condition because when slaughtered they yield a higher percentage of dressed meat, fat, and, in the case of cattle, hides. Not only is this true, but the packer understands that prime condition in the live animal is a strong indication of high quality in the carcass. In fact, it may be said that condition is a prime requisite for producing high quality. It has a greater influence undoubtedly than high breeding. Again, the packer pays a premium for cattle prime in condition and prime in quality, or good breeding, because in well-bred animals the percentage of high priced cuts is greater than in mongrel or indifferently bred stock. Undoubtedly, the tendency of the meat trade for several years has been to concentrate a large part of the slaughtering of the country at leading market centres like Chicago. In other words, gigantic and powerful packing companies have developed from small beginnings until they have within their combined power the ability to practically regulate the market for live cattle, hogs and sheep and meats

MEATS AND MEAT PRODUCTION

the world over. Chicago, the greatest live stock and meat market in the world, is each year enormously increasing its business in buying and slaughtering live stock. A large majority of local meat markets in the cities and villages throughout the United States are supplied through the medium of the packing houses located at our leading live stock markets. Packing houses can furnish any grade of meat desired. For example, in beef they can supply all grades from No. 1 to canning stock at prices corresponding with the quality. So economically is the business of the packing houses administered and so well organized are the various industries growing out of the wholesale slaughter of meats that it is possible for them to sell practically all grades of beef in cities and villages remote from their central plant at prices which successfully compete with local competition. The local purveyor of meats can buy whatever grade of meat he can dispose of to advantage. As a rule in the smaller cities and villages the retailer buys a medium to low grade carcass, because his trade is not willing to pay prices which of necessity must be paid to secure meat of high quality. It is safe to say that the beef offered at such markets is seldom above No. 2 in grade, no matter whether the market is supplied by packers or local slaughterers.

It is impossible to predict the ultimate effect upon the meat trade of the change from local to packing house slaughtering. On the one hand a packing house trust can control the price of live cattle, sheep and swine in such a manner as to reduce, temporarily if not permanently, or in some instances, destroy entirely the profits of the meat producing industry; on the other hand, such a trust can control the price of meat in the carcass to such an extent as seriously to discourage the consumption of meat by raising the price to such a degree that it will become one of the most expensive articles of diet. This power is not likely to be permanently exercised to the disadvantage of the public good, for it should be borne in mind that the very life of the packing business depends upon an active demand for meats by the consuming public. This demand will not exist when prices of meats are too high as compared with other food-stuffs. Producers will cease to prepare live stock for the block when the business becomes clearly unprofitable. In other words meat is not an absolutely necessary part of the diet of the masses, nor is the permanency of agriculture dependent upon continuous live-stock production.

Consumption and Production.—Notwithstanding improved methods for meat production the actual cost of cattle, sheep and swine as put upon the market by producers the world over is steadily on the increase. Nowhere is this in-

creased cost any more manifest than in the United States. Changes already referred to in the methods of slaughtering and increased cost of production of meats have not lessened the gross or even the per capita consumption of meats in the United States or Great Britain. The per capita consumption of beef in the United States has increased 15 per cent in the last few years, while it is probable, although statistics are wanting to substantiate the statement, that the per capita consumption of other meats has increased still more. The table at the bottom of this page, from Williams' 'The Forfeigner in the Farm Yard,' shows the increase in per capita consumption of meats in the United Kingdom of Great Britain:

CATTLE AND BEEF PRODUCED IN THE WORLD.

COUNTRY	Number of cattle other than milch cows	Annual tons beef
United States	53,100,000	3,059,000
Russia (in Europe).....	27,600,000	1,546,000
Argentina	22,900,000	
Germany	17,600,000	985,000
Austria-Hungary	14,200,000	795,000
Australia	13,300,000	325,000
France	12,900,000	784,000
Great Britain	10,900,000	661,000
Italy	5,000,000	280,000
Spain	2,100,000	112,000
Remainder of Europe.....	13,900,000	779,000
Canada	4,200,000	235,000
Total	197,700,000	9,561,000

The following table shows the annual per capita consumption of meat, including beef, mutton, and pork, for different countries:

ANNUAL PER CAPITA CONSUMPTION OF MEAT.

	Pounds
United States	150
Great Britain (England and Scotland).....	117 to 130
Germany	101
Norway	80
France	79½
Spain	70
Sweden, Belgium and Switzerland.....	61 to 70
Bohemia and Hungary.....	31
Russia	27
Portugal	27
Holland	27
Ireland	27
Italy	27
Austria-Hungary	27

Of all the above countries probably Italy consumes less meat per capita than any other.

As a nation the United States leads all others in the production of meat. The table presented herewith shows that the United States produces one third the world's supply of beef. The United States also produces more than one half the pork and one seventh of the mutton of the

MEATS OF ALL KINDS CONSUMED IN THE UNITED KINGDOM.

Average Annual Consumption.

DATE	Home	Foreign	Total	Home per head	Foreign per head	Total per head
	Tons	Tons	Tons	Pounds	Pounds	Pounds
1868-70.....	1,267,000	123,690	1,290,690	91.81	8.96	100.77
1878-80.....	1,284,000	452,158	1,736,158	84.25	29.66	113.91
1888-90.....	1,354,984	560,241	1,915,225	81.62	33.76	115.38
1891-93.....	1,425,662	636,719	2,062,381	83.72	37.45	121.17
1894-96.....	1,388,817	759,637	2,148,454	79.51	43.44	122.95

The above table shows that the per capita consumption of meat in Great Britain is steadily on the increase.

MECCA

world. Not only does this nation produce more meat than any other country, but the per capita consumption of meat is greatest:

WORLD'S CONSUMPTION OF MEAT, 1895.

	Tons
United Kingdom	1,880,000
France	1,250,000
Germany	1,720,000
Russia	2,270,000
Austria	1,160,000
Italy	370,000
Spain	430,000
Portugal	100,000
Sweden	160,000
Norway	70,000
Denmark	80,000
Holland	100,000
Belgium	160,000
Switzerland	120,000
Danubian States	380,000
Greece	70,000
Europe	10,320,000
United States	3,950,000
Canada	250,000
Australia	450,000
Argentina	280,000
Total	15,200,000

The accompanying table is interesting as showing the relative amounts of beef, mutton and pork consumed in a few of the principal countries:

DISTRIBUTION OF ANNUAL PER CAPITA CONSUMPTION OF MEATS IN 1898.

	Beef lbs.	Mutton lbs.	Pork lbs.	Total lbs.
United Kingdom	63	32	35	130
France	43	10	26½	79½
Germany	43	3½	54½	101
Belgium	36	2½	31½	70

Only about one third of the beef consumed in Great Britain is produced there. It is a significant and striking fact that 25 years ago only one tenth of the meat used there was imported, and now the United States furnishes by far the greater part of their foreign meat, Argentina ranking second, and British North America third. Williams has conclusively shown that the importation of American and other foreign beef and mutton has materially reduced the London wholesale price of these meats. His statement is here reproduced:

Average wholesale price of beef in London markets:

1876-80 from 5¼d. to 8 d. per pound.
1895 from 2¾d. to 6¼d. per pound.

Average wholesale price of mutton in London markets:

1876-80 from 7¾d. to 9 d. per pound.
1895 from 2¾d. to 7¾d. per pound.

Since 1893 the imports of meat into Great Britain have nearly doubled. In 1893, 465,000 tons, and in 1901, 919,000 tons were imported. The annual per capita consumption of foreign meat in 1893 was 37½ pounds, while in 1901 it was 49½ pounds. The total value of meat products exported from the United States in 1901 was \$186,106,037. Meat production is one of the leading industries of the farms in Iowa, Illinois, Missouri, Indiana, and Ohio. In fact wherever corn thrives there we find meat production an important industry. Corn is undoubtedly more largely used in meat production than any other feed. The problem of economic meat production in the United States is largely a question of the best method of utiliz-

ing corn and its by-products. There is a gradual and apparently necessary and certain change, just beginning, which will have an important bearing upon beef production in the United States. With the closing of many ranges in the range country which have hitherto furnished a high percentage of stockers and feeders which have been finished on the corn belt, or at any rate, upon corn grown in the corn belt, the problem presents itself, where are cattle feeders to look for their future supply of feeding cattle? Everything points to the conclusion that ultimately more of the cattle fatted for the market on the high priced lands in the corn belt will be bred and reared there. In other words the entire process of beef production will necessarily be carried on by the majority of cattle men. As it is, about 85 per cent of the native beef cattle marketed in Chicago have been previously bought as feeders and finished by cattle feeders who do not breed or rear the cattle they feed. The tendency in meat production at present is to put live stock in marketable condition and market them at an earlier age. This system involves better bred animals, more liberal feeding and a large use of nitrogenous feeds.

HERBERT W. MUMFORD,
*Professor of Animal Husbandry,
University of Illinois.*

Mecca, mēk'a, or **Makka**, Arabia, the holiest city of Islam, the capital of the province of Hedjaz, Asiatic Turkey, about 40 miles due east of Jiddah, its port on the Red Sea, with which it has telegraphic communication. The Mohammedans call it Umm-al-Kora, "Mother of Cities," and it derives its sanctity from having been the birthplace of Mohammed. The city stands in a narrow, sandy valley, enclosed by barren hills from 200 to 500 feet high, and is supplied with water from the mountains to the east by an aqueduct built in the 9th century, by Zubaidah, wife of Haroun-al-Raschid. The great mosque Beitu 'llah (House of God) or El-Haram (The Inviolable), enclosing the Caaba (q.v.), the Moslem "holy of holies," occupies a central square which divides the city into the northern upper, and the southern lower towns. The unpaved streets are wider than is usual in oriental towns, and the houses of stone, often three stories high, are lighted with windows looking on the street, giving them an occidental appearance. The stationary population is about 60,000, but the city is large enough for more than three times that number, and is annually filled at the time of the Hadj or pilgrimage to the Caaba, when apartments in almost every house are rented to strangers. This pilgrimage customary among the Arabs in early and idolatrous ages, and subsequently enjoined by Mohammed on all his followers, is the foun-

dation of Mecca's fame, and the only source of the inhabitants wealth and occupation.

The Meccāwī, or inhabitants of Mecca, are, with the exception of a few Hedjāzī Bedouins, all strangers by birth or parentage. They are, in fact, settlers or children of settlers, attracted hither by the love of gain, and as they care nothing for learning, the colleges of Mecca have fallen to decay, and the libraries, once rich, have disappeared. Mecca during the pilgrimage becomes for three or four months in the year the greatest market in the East.

The pilgrims converge upon the holy city from three directions; those coming from the south are Mohammedans from Oceanica, Java, Sumatra, Indo-China, India, Turkestan, and southern Persia, who pass into the Red Sea through the Strait of Bab-el-Mandeb and on to Jiddah the port of Mecca; the northern branch of the pilgrims, north Persians, Turcomans and people from Asia Minor and European Turkey, go southward to the holy city both by the land and sea routes; the third stream is from the west, Egyptians, Moroccans, Algerians, Tunisians, and Turks, who reach Jiddah through the Suez Canal. For years past the average number of pilgrims passing through the Suez Canal to Jiddah has been 16,000, but this number is sometimes greatly exceeded; the number in 1901 was 26,000, and in 1902 was over 40,000. The northern pilgrims, however, are only a small part of those who annually convene at Mecca. The total number every year exceeds 100,000, practically all of whom are present at the fête of Bairam. The Sherifs of Mecca, direct descendants of Mohammed, are now a numerous and widely spread body. They all wear the same costume, priding themselves on the green robe which marks their descent. These nobles, as they may be called, elect the Sherif of Mecca, and their choice is formally confirmed by the Ottoman Sultan. Ptolemy mentions Mecca under the designation of Macoraba. The Wahabees took it in 1803; but in 1833 it was given up to Mehemet Ali, whose son Ibrahim was made Sheik el Haram.

Méchain, Pierre François, pē-ār frāñ-swā mā-shāñ, French astronomer: b. Laon, France, 16 Aug. 1744; d. Castellon, Spain, 20 Sept. 1805. He became a mathematical tutor and devoted himself to the study of astronomy in his spare moments. In Paris he gained the interest of the astronomer Laland, who assisted him to a governmental position, in which he was engaged in the survey of the French coast and in astronomical observations. The Academy of Sciences elected him a member in 1782, and in 1785 he was editor of 'Connaissances des Temps,' in which appear some of his most valuable scientific papers. He was commissioned by the National Convention in 1791, in company with Delambre, to measure the arc of the meridian between Dunkirk and Barcelona. The results of the calculations made failed to satisfy him because of a slight discrepancy and though now appointed a director of the conservatory at Paris he persuaded the board of longitude to commission him to measure the arc between Dunkirk and the Balcric Isles, but died of fever in Spain while on his mission. See Delambre 'Histoire de l'Astronomie au dix-huitième Siècle.'

Mechanical Cashier, The, an American invention, patented in 1902; a mechanical, automatic apparatus for shops and stores, that receives money, places it beyond the reach of the operator or salesman, records the transaction and the number of the operator who makes it, stamps the cash check with the amount, totalizes and makes change. At the top of the machine is a row of openings, through which the money is put into the machine, a separate opening of suitable size and shape being provided for each denomination of coin or bill. Mounted behind each opening is a wheel, around the circumference of which is a series of pockets which receive the money placed in the machine. Each pocket takes but one coin or bill. Below each opening is a lever appropriately marked. When money is put into a pocket, the corresponding lever is pushed down. The wheel devoted to this particular denomination revolves sufficiently to bring the pocket below (which is always empty), in position behind the opening, the pocket containing the money being no longer accessible to the operator. Over the wheels is a glass cover which allows the contents of the pockets to be readily seen, and the amount of the purchase is registered on the keyboard. The sales ticket is slipped into the machine, and the operator turns the handle at the side, whereupon, simultaneously and automatically, it follows that (1) the exact amount of change is delivered from the machine; (2) the particulars of the sale are printed on three different parts of the sales ticket, and one part of it is clipped off and deposited in a locked drawer; (3) the particulars of the sale are also printed on a record tape within the machine; (4) the amount of the sale is included within a total, recorded by dials in front of the machine; (5) the depressed keys are returned to their normal position. While the functions which the machine performs are themselves complicated, the mechanism itself consists of the simplest mechanical movements, and no ordinary use of the machine can impair the perfection with which all of its parts operate. All parts of the machine are locked until a key is inserted, so that a clerk cannot operate it without the machine recording his number, and no one, not provided with a key, can tamper with the machine, or disturb its contents.

Mechanics, the science which treats of the motions of bodies. It is commonly divided into "theoretical mechanics" and "applied mechanics"; theoretical mechanics discussing the general principles of the subject, while applied mechanics treats of the application of these principles to physical structures and machines. The present article relates to theoretical mechanics only. Theoretical mechanics is divided, for convenience, into "kinematics" and "dynamics"; kinematics being the branch which treats of pure motion and its changes and combinations, without regard to its causes, and without the introduction of the ideas of mass and force; while dynamics includes the remainder of the subject, and discusses the mechanical relations of bodies which possess mass, and are subject to the action of physical forces. Dynamics is further subdivided into "statics" and "kinetics"; statics covering those cases in which the forces are in equilibrium, so that

MECHANICS

they do not produce any change of motion; while kinetics treats in the most general way of the changes of motion that unbalanced forces can produce.

Kinematics.—Motion consists in change of position, and it may be of several kinds. We shall consider, for the present, only those motions of which a rigid body is capable; a rigid body being defined as one whose size and shape remain invariable. Such a body is said to undergo a "translation" when it is moved in such a manner that its points all describe parallel straight lines. When it moves so that the position of one straight line that is fixed with respect to the body also remains fixed with respect to space in general, the motion is called a "rotation," and the fixed straight line is called the "axis" of the rotation. When it moves so that one of its points remains fixed, the motion may be described as "spherical," since every point of the body is then constrained to move on an imaginary sphere whose centre is the fixed point. Other kinds of motion may easily be imagined, but it can be proved that a rigid body can be conveyed from any proposed position in space to any other proposed position by giving it (1) a certain definite translation, followed by (2) a certain definite rotation; and it is possible to compute the direction and magnitude of the translation, the position of the axis of rotation, and the angle through which the body must turn in its rotation, when the initial and final positions of the body are given. Motion in which rotation and translation are combined is called "screw motion," or "twist."

When a rigid body receives a translation, the translation may be conveniently represented both in magnitude and in direction, by a straight line drawn parallel and equal to the path described by any point of the body. Such a straight line may be called the "representative vector" of the translation; a "vector" being defined, in geometry, as a straight line of definite length and direction. If the body receives two successive translations in the same direction, its final position will evidently be the same as if it had received the single translation whose representative vector is the sum of the representative vectors of the two successive translations that it actually did receive. A like principle holds true of successive translations which are not in the same direction. Thus let AB, in Fig. 1, represent a translation impressed upon a rigid body, and let BC represent a second and subsequent translation impressed upon the same body.

FIG. 1.

Then the body will evidently have the same final position that it would have if it had received only the single translation which is represented by the vector AC. The vector AC is called the "geometrical sum" of the vectors AB and BC, and the process by which it is obtained (namely, by joining A and C) is called "geometrical addition." The translation that is represented by AC is called the "resultant translation," and those which are represented

respectively by AB and BC are called the "component translations." A given translation can be "resolved" into two component translations that are together equivalent to it in the following manner: Let AC be the "representative vector" of the translation that is to be resolved. For one of the components we may choose any translation that we please. Let us take, for example, the one represented by AB. To find the other component, which, when combined with AB, will give AC, we obviously have only to join B and C, and BC is the representative vector of the component that was to be found.

Rotations may be combined with one another also, but the principles underlying their composition and resolution are more involved, and we shall merely state a few of the general facts with regard to this branch of the subject. Two successive rotations about the same axis are obviously equivalent to a single rotation about the same axis, through an angle equal to the sum or difference of the angles of the separate rotations, according as they are in the same or in opposite directions. Two successive rotations about different axes that are parallel may be shown to be equivalent to a single rotation about a certain third axis which is parallel to the other two, but which is not, in general, in the same plane with them. Two successive rotations about a pair of axes which intersect in a point P may be proved to be equivalent to a single rotation, through a definite angle, about a certain third axis which also passes through the point P. Two successive rotations about a pair of axes which do not intersect and are not parallel cannot be replaced by any single rotation. Their combined effect is the same as that of a definite rotation about a certain third axis, combined with a certain definite translation. In other words, two successive rotations about a pair of non-intersecting and non-parallel axes are together equivalent to a certain screw motion. Conversely, any given screw motion can be resolved (and in an infinite number of ways) into a pair of rotations about axes that are not parallel and do not intersect.

Having considered the ways in which a rigid body can move, we are prepared to consider the variation of motion with respect to time. When a body moves so that it always passes through equal distances in equal times, its velocity is said to be "uniform." The motion may be a pure translation (in which case it is said to be both uniform and "rectilinear"), or it may take place along a curved path. In the latter case it is still said to be uniform, provided the distances that are described in equal times are equal when measured along the curve. A rotation is similarly said to be "uniform" when the rotating body turns about its axis through equal angles in equal times. The quotient obtained by dividing the distance traversed by a uniformly moving body by the time occupied in traversing it is called the "velocity" or "speed" of the body; "speed" being used by many writers for the mere numerical quotient of the distance by the time, while "velocity" involves the idea of direction also. The "speeds" of two bodies may be equal, whether the bodies are moving in the same direction or not; but when the "velocities" are pronounced equal, it is understood, not only that the speeds are the same, but also

MECHANICS

that the bodies are moving in parallel directions. The speed (or velocity) of a moving body is commonly expressed in feet per second, or in centimetres per second. The speed of rotation of a body is usually given by stating the number of complete rotations made by the body per second, or by giving the number of "radians" through which it turns in a second; the "radian" being an angular unit of such magnitude that in any circle the arc which subtends the "radian" is numerically equal to the radius of the circle. (Expressed in degrees, the radian is approximately equal to $57^{\circ} 17' 44.8062''$.) When the motion of a body is not uniform, the speed of the body changes from instant to instant, and its value cannot be deduced as simply as in uniform motion. We may still think of the motion, however, as having, at each instant, a definite speed and direction; and we may designate this conception by the convenient phrase "instantaneous velocity." The instantaneous velocity of a body may be obtained, just as in the case of uniform motion, by dividing the distance traversed by the body by the time; but we must take the time (and also the distance) so short that in the interval considered the velocity remains sensibly constant. (In practice, this is effected by the aid of the branch of mathematics known as the differential calculus.) In the case of a rotating body, the instantaneous speed of rotation may be deduced in an analogous manner.

When a velocity is not uniform, it is said to be "accelerated." Strictly, this word would naturally be used only in the case in which the velocity is *increasing*; but it is applied, in theoretical mechanics, to all cases of variable motion, the acceleration being considered negative when the speed is decreasing. In like manner, we speak of the "angular acceleration" of a rotating body whose speed of rotation is not uniform. The angular acceleration of a rotating body may be discussed by methods that are entirely analogous to those that are employed in connection with non-rotative motions; but for the present we shall dwell only upon the acceleration of motions of the latter kind.

Velocities and accelerations, being "directed" quantities (or quantities involving direction as well as numerical magnitude), may be represented by vectors, just as translations were represented in Fig. 1; and they may be compounded and resolved by precisely the same methods. Consider, for example, a point situated at A

FIG. 2.

in Fig. 2, and approaching a fixed wall, DE, obliquely and with a velocity which is repre-

sented, both in magnitude and direction, by the vector AB. Let us draw, through A and B, respectively, lines that are perpendicular and parallel to the wall DE. If C is the intersection of these lines, then the vector AC represents the velocity with which the point A is approaching the wall DE, on the same scale of measurement to which AB has been drawn for representing its total (that is, oblique) velocity. Similarly, the vector CB represents, on the same scale, that component of the velocity of A which is parallel to DE. Cases in which velocities are resolved, as here indicated, into components that are at right angles to each other are very common in mechanics and in physics.

When a body moves with a variable speed, but always in the same direction, the acceleration to which it is subject is easily found. For acceleration is defined as the increase of the velocity, per unit of time. To find it, we therefore have to determine the instantaneous velocities of the body at two instants that are separated by a short interval of time, and divide their difference by the time-interval that separates them. If we know (as we do in many cases, and especially in problems in which terrestrial gravity is concerned) that the acceleration to which the body is subject is constant, the time-interval which separates the two instantaneous velocities that are compared may be finite, and as large as we please; but in the general case it is necessary to make use of the methods of the differential calculus in determining the acceleration to which a moving body is subject.

FIG. 3.

When the moving body describes a curve instead of a straight line, the acceleration to which it is subject acts obliquely, at each instant, to the direction in which the body is moving at that instant; for an acceleration which acts in the same straight line in which a body is moving can never change the direction of the motion, but can only increase or diminish its numerical magnitude. In Fig. 3, let P_1, P_2, P_3, P_4 be a curved path along which a given body is moving, and let the vectors V_1, V_2, V_3, V_4 represent the instantaneous velocities of the body at these respective points. Construct a new figure, as shown in the lower part of Fig. 3, by drawing, from a fixed centre, O, the vectors OA_1, OA_2, OA_3, OA_4 , parallel and equal to V_1, V_2, V_3, V_4 , and joining the points A_1, A_2, A_3, A_4 with a curve. The second figure so drawn is called the "hodograph" of the motion of the body, and is useful in the

MECHANICS

study of that motion. Conceive, for example, that as the body moves in its own path, a second body (which we may conveniently call the "image" of the first one) moves along the hodograph, so that the "image" passes the points A_1, A_2, A_3, A_4 , etc., as the real body passes the respective points P_1, P_2, P_3, P_4 , etc. Then the direction in which the motion of the real body is accelerated, at any given instant, is given by the direction in which the "image" is moving at that instant, in the hodograph; and the magnitude of the acceleration of the real body is also proportional to the instantaneous velocity of the "image" as it passes around the hodograph. When the acceleration is always directed toward a fixed centre, and varies in magnitude as the inverse square of the distance of the body from this fixed centre, the hodograph of the motion is a circle. (The hodographs of the planetary orbits, for example, are circles.) The point O , in Fig. 3, is not necessarily at the centre of the circle, however. It cannot be at the centre, in fact, unless the original orbit is itself a circle. Any motion in which the acceleration is always directed toward a fixed centre, and has a magnitude which is either constant or a function of the distance of the moving point (or body) from that fixed centre, is called a "central" motion.

Dynamics in General.—In dynamics we employ the notions of "mass" and "force." Thus when we observe an acceleration in the actual physical world, we postulate the existence of a physical agency which produces this acceleration, and we call this agency a "force." Forces may be compared in magnitude by observing the accelerations that they can produce in some arbitrary mass of matter that is selected as a standard; or (which is the same thing) they may be compared by observing the velocities that they can produce, when allowed to act upon such a standard mass of matter for some definite time,—say one second. The masses of two bodies may be compared, conversely, by submitting them to the action of equal forces for equal times, and comparing the velocities that are produced. (See MATTER.) The commonest units of mass are the pound and the kilogramme. The "pound" is (by definition) the mass of a certain bar of platinum which is marked "P.S., 1844, 1 lb.," and preserved in the Office of the Exchequer, at London. The "kilogramme" is (by definition) the mass of another certain bar of platinum, which is known as the "Kilogramme des Archives," and which is preserved in the Palais des Archives, at Paris. The pound is an arbitrary unit; but the kilogramme was intended to be (and is, very nearly,) equal in mass to a cubic decimetre of water, at its temperature of maximum density. The unit of force in modern precise scientific work is the "dyne," which is defined as the force which, if allowed to act upon a gramme of matter for one second, would communicate to it a velocity of one centimetre per second. It is about two per cent greater than the attractive force that the earth exerts upon a milligramme of matter. In ordinary engineering, in England and the United States, the unit of force that is employed is the attraction that the earth exerts upon a pound of matter. This unit is itself called a "pound," to the great confusion of students who desire to obtain clear ideas upon the subjects of mass and

force. The name "pound" should be reserved for the unit of mass, and "force" should (in the English-American system) be expressed in "poundals"; a "poundal" being defined as the force which, if allowed to act upon a pound of matter for one second, would communicate to it a velocity of one foot per second. The "poundal," as thus defined, is roughly equal to the attraction that the earth exerts upon half an (avoirdupois) ounce of matter. The relation between mass and weight is made plainer by considering the acceleration of a falling body. Such a body, when falling freely in a vacuum under the influence of gravity alone, acquires, at the end of the first second of its fall, a velocity of about 32.2 feet per second. Suppose, for simplicity, that the body contains one pound of matter. A "poundal" acting upon it for one second, would, by the definition of the poundal, generate in it a velocity of one foot per second. Hence we know that the actual force acting upon it is 32.2 poundals. In general, let g denote the "acceleration" due to gravity; that is, the velocity that gravity will communicate to a body, when allowed to act upon it for one second. Then if M is the mass of the body in pounds, the total gravitative force acting upon the body is Mg poundals. Hence, if W is the weight of the body in poundals, we have the simple fundamental relation, $W = Mg$. The units in which g is expressed are here supposed to be the foot and the second. If (as is usual in scientific work) the mass of the body is expressed in grammes, and the units employed in expressing the value of g are the centimetre and the second, the numerical value of g is about 981, and the foregoing equation expresses the weight of the body in "dynes." The value of g varies somewhat at different places on the earth's surface (see GRAVITY), and hence the weight of the body also varies; but the mass does not depend in any way upon the place in which the body is weighed, and it remains constant, in fact, unless it is modified by the addition of more matter to the body, or by the subtraction of a part of its original quantity of matter.

The words "mass" and "inertia" are nearly synonymous in many of their uses. "Mass," however, is properly employed to express the quantity of matter that a body contains, while "inertia" is used to signify certain of the simpler evidences that bodies actually do have mass. In nature, nothing has mass which has not also length, breadth and thickness. We may think of a point as endowed with mass, however, and this artifice is often useful as an aid to the understanding of certain of the principles of mechanics. Such a point is called a "physical point," or, more briefly, a "particle." The "moment of mass" of a particle with respect to a given straight line (or "axis") is the product of the numerical measure of the mass of the particle into the distance of the particle from the given axis. The "moment of mass" of an actual physical body is found by conceiving the body to be composed of an indefinitely great number of particles, and finding the moment of each of these particles with respect to the proposed axis. The sum of all the partial moments so found is taken as the moment of mass of the whole body. The "centre of mass" of a body (also called the "centre of gravity," or, preferably, the "centroid") is an

MECHANICS

imaginary point so situated that if the entire mass of the body were concentrated at this point, the point would have, with respect to any axis whatever, the same moment of mass that the actual body has with respect to that axis.

The "momentum" of a body is the product of the mass of the body into the velocity with which it is moving. The unit of momentum is the momentum of a unit mass, moving with a unit velocity. No general name has been proposed for this unit, when English measures are used. The name "bole" has been given to the momentum of a gram of matter, moving with a velocity of one centimetre per second, but this term has not been generally adopted.

The three fundamental "laws of motion," as given by Sir Isaac Newton, are as follows: (1) Every particle persists in its state of rest or of uniform motion along a straight line, except when it is compelled by external forces to change that state. (This is equivalent to saying that momentum is "conserved.") (2) Change of momentum is proportional to the force which produces it, and to the time during which that force acts; and the superadded momentum coincides in direction with the direction in which the force that induces it acts. (3) The mutual actions of two bodies upon each other are always equal, and directed in contrary senses. (For example, in the case of two attracting bodies, the forces by which the bodies are urged together are equal in magnitude, and opposite in direction.)

"Work" in mechanics, is defined as the overcoming of resistance through distance, and the work done in any given case is equal to the numerical measure of the force that is acting, multiplied by the distance through which the force acts. In scientific writings, the unit of work is commonly the "erg," which is the work done by a force of one dyne, acting through a distance of one centimetre. In ordinary engineering; (in the United States and England), the unit of work is the "foot-pound," which is defined as the quantity of work done by a force equal to the earth's attraction upon a pound of matter, acting through a distance of one foot. This unit is ambiguous, unless the place is stated at which the earth's attraction upon the pound is to be measured. It serves well enough for most engineering purposes, but it would be far better to use the "foot-poundal" as the unit of work; the "foot-poundal" being the work done by a poundal, in acting through a distance of one foot.

Statics.—Statics is that branch of dynamics which deals with balanced forces,—that is, with forces which are so related to one another that when they act simultaneously they do not produce motion in the body (or system) upon which they act. It is evident that when two equal and opposite forces are applied to a material particle, they will balance each other, so that their resultant effect will be zero. Three or more forces may also act simultaneously upon a particle, or upon a body of finite dimensions, so as not to produce motion, provided certain conditions are fulfilled; and it is the study of these necessary conditions that constitutes "statics." The body (or system) upon which a system of balanced forces is acting is said to be in "equilibrium." If the conditions are such that the body, when disturbed slightly, tends to return to its primitive position, the equilib-

rium is said to be "stable"; if, when so disturbed, the body tends to depart still further from its primitive position, the equilibrium is said to be "unstable"; and, finally, if the body, when disturbed, does not tend either to return to its primitive position nor to depart further from it, the equilibrium is said to be "indifferent." A right, circular cone is in stable equilibrium when resting upon its base, in unstable equilibrium when balanced upon its vertex, and in indifferent equilibrium when resting upon its side. In applied mechanics it is important that the equilibrium of every structure should be *stable*.

In the present article we shall consider only the equilibrium of forces whose directions and points of application all lie in the same plane; for this treatment will not only simplify the subject, but will suffice for the great majority of the problems that actually arise in practice. Moreover, it is easy to extend the principles thus developed, so as to make them applicable to the general case, where the forces and their points of application are not coplanar.

FIG. 4.

Forces, like motions, velocities and accelerations, may be represented by vectors, and may be compounded, and resolved into components, in a similar manner. Let us consider, for example, the condition that must be fulfilled, in order that three forces may be in equilibrium, when acting upon the same particle. Let P, in Fig. 4, be the particle, and let the three forces be represented, both in magnitude and direction, by the respective lines PA, PB and PC. To find the resultant of the two forces PA and PB, we complete the parallelogram PAQB (which is called the "parallelogram" of the forces), and draw the diagonal PQ. The line PQ will then represent, both in magnitude and

FIG. 5.

direction, a force which, if applied to the particle P, would produce an effect identical with that produced by PA and PB together. Hence the necessary and sufficient condition that the three forces PA, PB and PC shall be in equilibrium, when acting upon the physical particle P, is that PC shall be equal to PQ in magnitude, and opposite to it in direction. We might, if we chose, compound any other pair of the forces, and compare their resultant, in a similar man-

MECHANICS

ner, with the third force. In Fig. 5, for example, the same three forces are represented. PQ is here the resultant of PA and PC; and the condition of equilibrium is that PQ shall be equal and opposite to PB. That all these conditions are really identical may be seen by observing that they are all equivalent to the single condition that the lengths and directions of PA, PB and PC, in either Fig. 4 or Fig. 5, are such that a closed triangle can be drawn with three lines having the same lengths and direc-

FIG. 6.

FIG. 7.

tions as PA, PB and PC. In Fig. 6, for example, LM is equal to PA, and is drawn in the same direction as PA; and MN and NL are respectively equal to PB and PC, both in magnitude and in direction. The fact that the triangle in Fig. 6 (which is called the "triangle of forces") is really closed may be readily proved by the geometry of Fig. 4. In general, the condition that any system of forces may be in equilibrium when acting upon a particle, is that a closed polygon can be constructed with lines equal in length to the vectors that represent the forces, and drawn also in the same direction and sense. In Fig. 7, for example, the four forces acting upon the particle P are in equilibrium when, and only when, a closed polygon, such as is shown in Fig. 8, can be drawn with lines that have the same length, direction and sense as the lines PA, PB, PC, and PD, which represent, in Fig. 7, the forces acting upon the particle. A polygon such as that shown in Fig. 8 is called a "polygon of forces."

FIG. 8.

though necessary to equilibrium, is not sufficient. In the case of a rigid body of finite dimensions, the polygon condition ensures that the given system of forces will not communicate to the body any motion of translation, but it does not ensure that no rotation will be produced. In order that the forces acting upon the body may be in equilibrium with respect to their tendency to produce rotation, it is necessary that the algebraic sum of the "moments" of all the forces with respect to any given axis shall be zero. The "moment" of a force with respect to an axis is the product obtained by multiplying the numerical measure of the force by the perpendicular let fall from the given axis upon the

line representing the direction in which the force acts. In Fig. 9 the shaded area represents a rigid body, and the vectors AB, CD and EF represent the directions and intensities of three coplanar forces which are acting upon it at the three points A, C and E, respectively. In order that the body may remain at rest under the influence of these forces, two conditions must be fulfilled; namely, (1) the condition that the forces produce no motion of translation, and (2) the condition that they produce no motion of rotation. The first of these is the "polygon" condition, which requires that a closed triangle can be drawn (as indicated in Fig. 10) by three lines that are parallel and equal to AB, CD and EF, and drawn in the same senses as these vectors. In order to deduce the condition that there shall be equilibrium with respect to rotation also, let us consider the tendency of the three forces to produce rotation about some arbitrary axis, perpendicular to the plane in which the three forces act; and let P, in Fig. 9, denote the position of the axis so chosen. From P draw three lines, perpendicular respectively to the vectors representing the forces, and let the lengths of these perpendiculars be a , b and c , as indicated. Then the tendency of the force CD to produce rotation about P is proportional to the magnitude of the force CD, and to the length of the perpendicular b . That is, the tendency of CD to produce rotation about an axis perpendicular to the plane of the paper and passing through P is proportional to the "moment" of the force CD, with respect to the axis through P. If we represent the numerical magnitude of the force CD by the symbol (CD) , then the moment of this force with respect to P is $b(CD)$. Similarly, the moments of AB and EF with respect to P are $a(AB)$ and $c(EF)$. The force CD tends to rotate the body about the point P in the direction in which the hands of a watch move, while the forces AB and EF each tend to rotate it in the opposite direction; and equilibrium therefore implies the equality of these opposite rotative tendencies,—an equality which is expressed by the equation $b(CD) = a(AB) + c(EF)$.

FIG. 9.

This relation and the "polygon" condition already stated, are both necessary and sufficient to ensure the equilibrium of the body. It may be shown, for example, that if the combined moment of any system of coplanar forces is zero with respect to any one axis perpendicular to

FIG. 10.

FIG. 11.

MECHANICS

their plane, it is also zero with respect to any other axis that is perpendicular to that plane. It may also be shown that the combined moments of any two forces (such as A and B, in Fig. 11,) which are applied to the same point are together equal to the moment of the resultant of those two forces, when all three of the moments that are concerned are taken with reference to the same axis, perpendicular to the plane of the forces. In Fig. 11, for example, $a.(A)+b.(B)=c.(C)$. (This last proposition is known as "Varignon's Theorem.")

Friction is often of the greatest importance in the practical applications of the principles of statics, but the general subject is too large to be adequately treated in the present article. Friction is often called a "passive force," since it never tends to produce motion, but always acts in opposition to other forces in such a way as to prevent motion, or to diminish it. The friction between two bodies that are in contact acts in the surface along which the bodies touch each other, and always in such a direction as to oppose the sliding of either of the bodies upon the other. The magnitude of the frictional force between two bodies when, under the influence of external forces, one of the bodies is just on the point of sliding upon the other one, is called the "limiting static friction"; and it is this limiting value of the static friction which is usually meant, when "friction" is referred to, quantitatively and without further qualification, in connection with statical problems. It is usually taught, in treatises on mechanics, that the limiting static friction between two bodies is independent of the area of the surface of contact between the two bodies, and that it bears a constant ratio to the total normal pressure which one of the bodies exerts upon the other. (See FRICTION.) The constant by which the total normal pressure must be multiplied in order to obtain the limiting static friction is called the "coefficient of static friction." Its value may be determined, experimentally, as follows: Let an inclined plane and a weight be made of the respective substances whose coefficient is to be determined, and let the weight be laid upon the inclined plane, as indicated in

FIG. 12.

Fig. 12. Let W be the attractive force exerted by the earth upon the weight, and let C be the coefficient of friction required. Resolving the force W into two components, P and Q , respectively parallel and perpendicular to the plane, it is evident that it is the component P which urges the weight down the plane, while it is the component Q which determines the friction, R , which opposes P . If the plane is so adjusted, by experiment, that the weight is just on the point of sliding, then the friction has its maximum static value. In other words, the friction is then numerically equal to CQ , and we therefore have the numerical relation $P=CQ$. But it is easy to show that $P=Q \tan \alpha$, and it

therefore follows that $C=\tan \alpha$. We therefore merely have to determine, experimentally, the value of the angle α (which is known as the "angle of repose"), and its natural tangent is the value of the coefficient, C .

Kinetics.—When the forces acting upon a system are not balanced, they tend to set the system in motion. If the "polygon condition" is not fulfilled, a motion of translation will result; if the algebraic sum of the moments of the forces is not zero, a motion of rotation will result; and if neither of these conditions is fulfilled, the resulting motion (at any given instant) will be compounded of a translation and a rotation;—that is, it will be a "screw motion." We shall first consider the behavior of a physical particle when subjected to unbalanced forces,—or (which amounts to the same thing) the behavior of a rigid body not subjected to any turning moment. The unbalanced force acting upon such a body produces an acceleration in the body's motion, and the acceleration (or change of velocity per unit of time) will be in the direction in which the unbalanced force acts. For the present it will be assumed that the unbalanced force acts in the line along which the particle is moving, so that it tends to increase (or diminish) the particle's speed, without influencing the direction of the motion. We shall also confine the discussion, for the present, to the case in which the unbalanced force (and therefore the acceleration) is constant, both in direction and in magnitude. The complete discussion of the general case, in which the acceleration is variable in magnitude and in direction, involves the use of the differential and integral calculus.

Suppose that a physical particle of mass M is acted upon for a period of T seconds by a constant force of magnitude F , and let the velocities of the particle be V_1 and V , respectively, at the beginning and end of the time T . Then it is plain that the total change of the velocity has been $V-V_1$, and that the change in velocity per second has been $\frac{V-V_1}{T}$. From what has

been said above about the measurement of forces, it follows that this last expression would be the numerical magnitude of the force F , if the mass of the particle that is accelerated were unity. The actual mass, however, has been assumed to be M ; and hence the force F is M times as great as the value of this expression. In other words, the numerical magnitude of F is given by the equation

$$F = \frac{M(V - V_1)}{T}$$

which is equivalent to

$$FT = M(V - V_1).$$

The right hand member of this equation is the change in the momentum of the particle; and hence we have the elementary theorem that the change in momentum that is produced by a constant force acting upon a physical particle is numerically equal to the magnitude of the force multiplied by the time that the force acts. If the particle starts from rest, then $V_1=0$, and we have simply $FT=MV$. As the velocity increases uniformly under the influence of a constant force, we may find the distance, S , that the particle will traverse, in the time T , by the following method: The average velocity of the particle during the time T is $\frac{1}{2}(V + V_1)$, and hence the distance, S , that the particle will move

MECHANICS

during that time is $S = \frac{1}{2}T(V + V_1)$. If V is eliminated from this equation by means of the relation $FT = M(V - V_1)$, we easily find the following final result:

$$S = \frac{F T^2}{2M} + V_1 T.$$

The expression $F \div M$ is the force acting upon the particle, *per unit of its mass*; and for brevity it may be denoted by the single letter G . With this change the formula reads

$$S = \frac{1}{2}GT^2 + V_1 T.$$

If the particle is initially at rest (that is, if $V_1 = 0$), the formula for the distance traversed takes the still simpler form

$$S = \frac{1}{2}GT^2.$$

This expression is familiarly illustrated by the motion of a body starting from rest and falling freely, in a vacuum, under the influence of gravity. If T is expressed in seconds, and S is the number of feet that the body will fall during the first T seconds, then the numerical value of G is approximately 32.2, although it varies somewhat with the place at which the experiment is performed.

The conception of "energy" is greatly used in theoretical mechanics, as it simplifies the treatment of many problems, and also simplifies the mode of representing, to the mind, the fundamental principles governing the behavior of moving systems. "Work," in the mechanical sense, has already been defined (above) as the product of the numerical magnitude of a force by the distance through which the force acts. The "energy" of a system is merely the amount of mechanical work that the system is capable of performing, in virtue either of the relative positions of its parts, or of their states of motion. The energy is said to be "potential" if it depends upon the positions of the various parts of the system with respect to one another, and it is said to be "kinetic" if it depends upon the velocities of the several parts at the instant considered. The energy of a stationary raised weight is entirely potential; that is, the weight can do work, but only by being allowed to approach the earth. The maximum amount of work that a 10-pound weight can do, in descending 10 feet, is 100 foot-pounds (or 3,220 foot-pounds). If it is allowed to fall freely (that is, without being attached to a wheel-train, and without being resisted in any other way), it does not do any work at all; but when it has descended 10 feet (as before), it has acquired a certain definite velocity, and it cannot be brought to rest until it is allowed to perform 3,220 foot-pounds of work, either in raising another weight, or in overcoming frictional resistances, or in some other manner. This is only another mode of saying that the "potential" energy of the raised weight has been transformed into a precisely equal quantity of "kinetic" energy. In most (and probably in all) of the operations of nature, energy is neither created nor destroyed, but only transformed from one state into another. This fact constitutes the well-known principle of the "conservation of energy," which appears to be true of all of the forces and changes that occur in nature. In theoretical mechanics, however, we do not contemplate the conversion of mechanical energy into heat, nor into the energy of chemical separation; and hence in this branch of science the application of the general theory of the con-

servation of energy is restricted to those motions in which the energies that are converted into one another are obviously and altogether mechanical in their nature. (For a further discussion of these matters, see ENERGY.) In order that we may be able to compute the work that a given body can perform in virtue of its velocity, we must know how the kinetic energy of such a body depends upon the body's mass and velocity. To obtain the formula required for this purpose, assume that the observed velocity, V , has been generated by the accelerating effect of a constant force of magnitude F , acting upon the body (whose mass is M) for a time T ; the body being initially at rest. If S is the distance that the body would be impelled in the time T by the force F , then the work done by the force F , in generating the velocity V , is FS . But it has already been shown that S , in a case like this, can be expressed in terms of

FT^2 by means of the formula $S = \frac{FT^2}{2M}$.

Hence FS , which is the total work done by the force in giving the body the velocity V , and is therefore equal to the kinetic energy of the

body, has the value $\frac{F^2 T^2}{2M}$. Now it was shown,

above, that $FT = MV$, when the body starts from rest; and hence $F^2 T^2 = M^2 V^2$. The expression for the kinetic energy may therefore

be written in the form $\frac{M^2 V^2}{2M}$, or simply $\frac{1}{2} M V^2$.

The kinetic energy of a mass M , moving with a velocity V , is therefore found by multiplying the square of the velocity by one half of the body's mass. As an illustration of the usefulness of the idea of energy in the simplification of problems, let us deduce the formula for the speed that would be acquired by a body starting from rest, and falling freely through a height S . The formula could be deduced by a method analogous to that already given for finding the distance that the body would fall in a given time; but when the formula for finding the kinetic energy of a body is known, we may proceed by the following simpler method: Representing (as before) the attraction of the earth for a unit mass by G , the total force on the mass M will be $F = MG$. The loss of potential energy due to the fall through a height S will therefore be $FS = MGS$. But since the body started from rest, and has not been allowed to do any external work whatever, this loss of potential energy must be numerically equal to the total kinetic energy that the body possesses at the end of its fall; that is, we must have the relation $MGS = \frac{1}{2} M V^2$. Solving this equation for V , we find $V = \sqrt{2GS}$, which is the formula required.

A particle will continue to move in a straight line, provided the resultant force to which it is subject acts along the line in which the particle is moving. A particle which is moving in a curve must therefore be subject to the action of a resultant force whose direction, at each instant, is different from the direction of the motion at that instant. The problems that arise in connection with the motion of a particle in a curve are of two kinds: (1) the form of the path, and the velocity of the particle at each

MECHANICS

instant, may be given, and the direction and magnitude of the force acting upon the particle at each instant may be required; or (2) the direction and intensity of the resultant force may be known for every point of space, and it may be required to deduce the motion of the particle, when its initial position and its initial velocity (both in magnitude and direction) are known. The first of these problems is much the simpler. When the motion is such that the particle never departs from a given fixed plane, the direction and magnitude of the resultant force, at each instant, can be determined by constructing the "hodograph" of the motion. (See Fig. 3, above.) When the particle describes a tortuous curve in space, the problem becomes too complicated for treatment in the present article. An especially interesting and important case of the mo-

FIG. 13.

tion of a particle is that in which the motion is confined to a plane, and the speed is constant at all points of the path. In Fig. 13, let P be the position of the particle at a given instant, and let PQ be the path that it is following. In general, the resultant force acting upon the particle will have an oblique direction, as shown by the vector PA. Draw through P a line (PC) tangent to the path, and another line (PB) normal (or perpendicular) to the path, and complete the rectangle PCAB. Then PC and PB are, respectively, the tangential and normal components of the resultant force, PA, which is acting upon the particle. The component PC tends to alter the speed of the particle without changing the direction of the motion, and the component PB tends to alter the direction of the motion, without modifying the speed. In the case in which the speed of the particle is uniform, therefore, the tangential component, PC, must be zero at all points of the path, and therefore the resultant force, PA, coincides with PB, and is everywhere normal to the path. A familiar instance of motion of this kind is afforded by the experiment of whirling a stone with a constant speed in a circle to whose centre it is attached by means of an inextensible string. To deduce the tension upon the string in such a case, we may proceed as follows: Let O, in Fig. 14, be the fixed centre, P the position of the stone at any given instant, and R(=OP) the constant length of the string. Let F be the (unknown) tension upon the string, and V the constant speed of the stone in its circular path. After the lapse of a very short time T, the stone would be at S (where PS=VT), if it were not restrained by the string. Similarly, if the stone

FIG. 14.

were initially at rest at P, and were subject to a radial force F of constant magnitude, it would move toward the centre O, during the time T, by a distance, PQ, which may be determined thus: Under the influence of a constant force F, acting for the time T, a particle of mass M will acquire a velocity, v , which is given by the equation $FT=Mv$, or $v=\frac{FT}{M}$.

Hence if the stone were to move freely from P under the influence of the force F for a short time T, it would reach Q with the velocity FT/M . Its average velocity along PQ would be half of this value, or $FT/2M$; and therefore the distance PQ is equal to this average velocity multiplied by T, or to $FT^2/2M$. To find the actual position of the stone, after the lapse of the time T, we draw the line SN, parallel and equal to PQ; and N is then the position of the stone at the end of the time T, provided T is so short that SN can be regarded as sensibly normal to the path of the stone. (In order that this demonstration may be truly rigorous, the time T must be infinitely short, the problem then becoming one in the differential calculus.) To eliminate the time T, draw the chord PN, and the radius ON, and let X be the angle included between NP and SP. It may then be shown, by elementary geometry, that the angle PON is equal to $2X$. We then have (from the triangle SPN)

$$\tan X = \frac{SN}{PS} = \frac{FT^2}{2M} \div VT = \frac{FT}{2MV}$$

from the triangle QNO we have $\sin(2X) = \frac{QN}{ON} = \frac{PS}{ON} = \frac{VT}{R}$. Now since the time T is exceedingly small, the angle X is also exceedingly small; and this being the case, we may write, without sensible error, $\sin(2X) = 2 \sin X = 2 \tan X$. Replacing $\sin(2X)$ and $\tan X$, in this equation, by their values as found above, we have

$$\frac{VT}{R} = \frac{2FT}{2MV}, \text{ or finally, } F = \frac{MV^2}{R}$$

The radial force on the string is therefore found by multiplying the mass of the stone by the square of the linear speed of the stone in its path, and dividing by the radius of the circle. If M is expressed in grammes, R in centimetres, and V in centimetres per second, F will be expressed in dynes; and if M is expressed in pounds, R in feet, and V in feet per second, F will be expressed in poundals. When considered as acting upon the stone, and tending to draw it toward the centre of the circle, F may be called the "centripetal" force; and when considered as acting upon the string and tending to break it, F is often called the "centrifugal" force. Although, for the sake of definiteness, the formula for F has been deduced for the familiar case of a stone whirled at the extremity of a string, it is evident that the same formula may be applied to any case in which a particle is moving in a curve under the influence of a force that is always normal to the path, provided (in case the path is not circular) we use, for R, the radius of curvature of the path at the point for which F is to be computed. When the particle is in free orbital motion about an attracting centre, and moving with a uniform circular motion, the value of F, as computed by the foregoing formula, gives the total attractive

MECHANICS

force exerted upon the particle by the attracting centre.

The motion of a projectile in a vacuum, and under the constant downward attraction of the earth, affords another instructive example of the principles governing the curvilinear motion of a particle. Let the projectile be impelled with an initial velocity V , as measured in the direction in which its motion begins, and let A be the angle QOM (see Fig. 15) that the direction

of its initial motion makes with the horizontal. The horizontal component of its motion, at the outset, is $V \cos A$; and this horizontal component is not changed in any way during the entire motion, for the reason that gravity always acts vertically, so that any change of motion that it produces must be primarily vertical in direction. Let OPM be the path of the projectile, and let P be the position of the projectile after the lapse of the time T. If X is the horizontal distance that the projectile has traveled, and Y is its height above OM, it follows that $X = T.V \cos A$, on account of the constancy of the horizontal component of the velocity. To find Y we must first find the point Q, where the projectile would be at the end of the time T, if gravity were annihilated; and we must then make allowance for the fact that in the time T, a body will fall through a vertical height equal to $\frac{1}{2}GT^2$, as shown in an earlier section of this article. The height of Q above OM is given by the equation $QR = OR \cdot \tan A = X \cdot \tan A$; and if from QR we subtract the distance that the projectile will fall in the time T, we have $Y = PR = QR - QP = X \cdot \tan A - \frac{1}{2}GT^2$; or, replacing T by $X/V \cdot \cos A$, we have

$$Y = X \cdot \tan A = \frac{GX^2}{2V^2 \cos^2 A}$$

This is the equation of a parabola. The "range" of the projectile is the distance OM, from the starting point to the point at which the projectile has descended again to the same level that it had at first. The height Y is zero both at O and at M; and by putting $Y=0$ in the foregoing equation and solving for X we find that $OM=(2 \sin A \cdot \cos A \cdot V^2) \div g$; and by a simple trigonometric transformation this may be written $OM=(V^2 \cdot \sin 2A) \div g$. To find the angle of elevation, A, which will give the greatest range, we therefore have to choose $2A$ so that its sine shall have the greatest value possible, namely, we have to make $2A=90^\circ$, or $A=45^\circ$. In the actual case, in which the projectile is moving through a resisting medium

such as air, these results have to be modified quite largely; but the subject then becomes too technical and difficult for treatment in this place.

When a particle moves about a fixed centre of attraction (or repulsion), and the force acting upon it depends only upon the distance of the particle from the centre at each instant, the motion is said to be "central"; and if the force is attractive, and varies inversely as the square of the distance of the particle from the centre, the motion is further said to be "planetary," since these conditions are fulfilled by a planet revolving about a central sun, in accordance with the Newtonian law of gravitation. If the attracting centre in planetary motion is fixed, the moving particle will follow certain laws that were discovered empirically by Kepler, and proved mathematically by Newton. Kepler's three laws, when generalized slightly, are as follows: (1) A particle, moving freely under the influence of an attractive force that tends always toward a fixed centre and varies in intensity in proportion to the inverse square of the distance from that centre, will describe a conic section having the attracting centre as one of its foci. (2) The motion of such a particle will be such that the line joining the particle and the attracting centre will sweep over equal areas in equal times. (In Fig. 16, for

example, let PQ and MN be two different arcs of the orbit, which are described in equal times; then the shaded areas are equal.) Kepler's third law supposes the existence of two or more particles moving simultaneously about the same centre, and it states that (3) when the orbits are ellipses, the squares of the times required by the several particles to perform a complete revolution about the centre are proportional to the cubes of the major axes of the respective ellipses. The last law assumes that the particles are so small in mass that they do not exert sensible attractive forces upon one another. When three or more particles that are comparable in mass (and therefore in attractive power) are moving, the phenomena become exceedingly involved, and no general solution of this famous problem (known as the "problem of N bodies") has yet been given. It fortunately happens, in the solar system, that the masses of the planets and satellites are very small indeed in comparison with that of the sun, and this fact makes it possible to greatly simplify the treatment of the problem. The motions of the planets are first computed as though each was dominated solely by the sun, and the effects of the small attractive in-

MECHANICS

fluences of the planets upon one another are then introduced as slight corrections, whose values can be found to a degree of approximation sufficient for practical purposes, though the computations involved are laborious indeed, even in this comparatively simple case. In sidereal astronomy many instances are known in which three or more stars, apparently of approximately equal mass, are moving about in such a way that each is strongly influenced by all the others. In such a case the "problem of three bodies" would have to be faced in its most difficult and general phase; but we shall not have observations of these bodies for many years (and probably never), of sufficient accuracy to demand any very precise analysis.

The principles stated above with reference to the motion of a physical particle apply also to the motion of a rigid body of finite dimensions, when the resultant force acting upon the body is applied to its centre of mass. When the force is not applied at this point, the rigid body is not only urged forward through space, but is also set in rotation; and the general problem of determining the motion of such a body, when acted upon by a force which does not pass through its centre of mass, is somewhat complicated. We shall here consider only the case in which the rigid body is conditioned by fixing the positions of two of its points. The only motion that the body can then have, is a rotation about the straight line (or "axis") passing through these points.

The phenomena of rotation of a rigid body, when subjected to the action of a force which tends to increase or diminish the velocity of the rotation, are more readily grasped when the motion of the system shown in Fig. 17 is

FIG. 17.

thoroughly understood. Here O is the axis of rotation, as seen endwise, and P is a physical particle, which has the mass M, and is attached to the axis O by means of a massless arm, PO. Rigidly attached to the arm PO is a massless pulley of radius A, around which a weightless and perfectly pliable cord passes. A constant force F is applied to the cord, and under the influence of this force the particle P is caused to revolve about the axis O. The problem is, to determine the magnitude that the force F must have, in order that the system may acquire, at the end of the time T, a velocity of rotation of N turns per second. Obviously the effect of the force F upon the particle P is the same as the effect of a force f

of magnitude FA/R applied to P directly, and always perpendicularly to the radius R (as indicated by the dotted lines). Now if the particle P starts from rest, and if V is its linear speed at the end of the time T, as measured along the circular path that P describes, we obviously have the relation $fT = MV$, just as in the case of rectilinear motion; and this is equivalent to the equation $FAT = MVR$. It is more convenient to express the velocity in terms of the number of revolutions that P is making, per second; and this may easily be done, as follows: The circumference of the path described by P is $2.832R$; and if N is the number of revolutions, per second, that P is making about the axis, at the end of the time T, we evidently have $V = 6.2832RN$. Replacing V by this expression in the equation just given, we have $FAT = 6.2832NMR$; and from this equation we can easily calculate N, the speed of the system as expressed in revolutions per second, after the force F has been acting for T seconds with a leverage R. If, instead of a single particle P, the system consists of a number of particles with the several masses M_1, M_2, M_3 , etc., placed at the extremities of a rigid, wheel-like arrangement of massless spokes having the respective lengths R_1, R_2, R_3 , etc., then in order that F, when allowed to act for T seconds, shall give the system as a whole the final rotary velocity of N revolutions per second, we must have

$FAT = 6.2832 N (M_1 R_1^2 + M_2 R_2^2 + M_3 R_3^2 + \text{etc.})$. The expression within the parenthesis is called the "moment of inertia" of the system, and is commonly represented by I; so that the foregoing equation for any system of rigidly connected particles may be written

$$FAT = 6.2832NI, \text{ or } F = 6.2832NI/AT.$$

The formula just given applies equally well to a rigid body, even though it is deduced for the case of a system of discrete particles; for we may evidently regard the rigid body as composed of an infinite number of such particles. The "moment of inertia" of a rigid body with respect to a given axis is found by conceiving the body to be divided into infinitely many little masses, multiplying each little mass by the square of its distance from the axis, and taking the sum of the partial products so obtained. (In order to actually effect this summation for a rigid body, the integral calculus is required.)

To find the kinetic energy of a rotating rigid body, we may proceed as follows: The force which produces the rotation being assumed to be uniform, the speed of rotation of the rigid body will increase at a uniform rate, and hence, if its final speed of rotation is N revolutions per second, its average speed (since it starts from rest) is $N/2$ revolutions per second. Hence the total number of revolutions that it makes in the time T is $NT/2$. The work done by the force F in one revolution is $6.2832AF$, since $6.2832A$ is the length of cord (see Fig. 17) which unwinds in one revolution. The total work done by the force F in the whole $NT/2$ revolutions is therefore $6.2832AFNT/2$, and this must be equal to the kinetic energy of rotation. Replacing the product AFT by the value $(6.2832NI)$ already found for it, we have, as the final expression for the kinetic energy of rotation of a rigid body, $\frac{1}{2}(6.2832 N^2)I$.

When the body under consideration is not

MECHANICS OF EVOLUTION—MECHANICSVILLE

rigid, but changes its form more or less under the influence of the impressed forces, the problems of dynamics become far more complicated, and often cannot be solved so as to obtain the solution in finite terms. (See **ELASTICITY**.) Solutions have been obtained in certain simple cases, as (for example) in the motion of stretched strings; but when the deformation to which the body is subject is commensurate with the dimensions of the body itself, there are few cases in which mathematicians have succeeded in overcoming the difficulties involved.

Mechanics is a subject of an essentially mathematical character, and a good knowledge of mathematics is necessary for its proper comprehension. Consult: Love, 'Theoretical Mechanics'; Mach, 'Science of Mechanics'; Rankine, 'Applied Mechanics'; Routh, 'Elementary Rigid Dynamics' and 'Advanced Rigid Dynamics'; Tait and Steele, 'Dynamics of a Particle'; Ziwet, 'Elementary Treatise on Theoretical Mechanics.' Ziwet gives, in connection with each general division of the subject, an excellent list of references to works in which that division is more thoroughly discussed.

Mechanics of Evolution. See **KINETOGENESIS**.

Mechanics' Lien, in statute law, a lien or claim upon real estate to secure payment for work or labor performed on, or materials furnished for buildings or other improvements thereon; which labor or material has been furnished at the request or with the consent, express or implied, of the owner of such real estate or other property. In early English law lands were charged with liens by express agreement of the owner, and were generally covered by mortgages. Courts of equity also recognized mortgage agreements. By statute other liens were created, including judgment liens and liens for taxes and assessments. In the United States the increasing number of independent contractors who constructed buildings on contract, and of dealers in building material, resulted in the enactment of numerous mechanic lien laws. Such laws have also been enacted in Canada, but not in Great Britain. The statutes hold that the value of real estate is increased by the addition of improvements and that the property should accordingly be held subject to such claims. Mechanics' liens are valid prior liens over all other claims, such as mortgages, judgments or taxes, and the term covers all claims for labor, whether skilled or unskilled, and for all building materials furnished. But liens are held against the property and not personally against the owner. The lien only attaches to the very property upon which the work was done, and has no effect on other pieces of real estate of the owner. In most States the law provides that the work to which the owner is entitled under a contract must be entirely performed before the contractor can file a lien. The statutes of mechanics' liens vary in the different States in the matter of details, time of filing, method of procedure, etc., and State statutes should be consulted. See **LIEN**; **MORTGAGE**.

Mechanicsburg, mē-kān'iks-bērg, Pa., borough, in Cumberland County, on the Cumberland Valley railroad; about 10 miles west by

south of Harrisburg. It was settled in 1806, and in 1828 was incorporated as a borough. It is situated in an agricultural region, in which there are large deposits of iron ore. The chief manufactures are foundry and machine-shop products, spokes and wheels, wagons and carriages. The borough is a distributing centre for the surrounding iron region, and a shipping point for a large quantity of iron ore. The Irving College (Lutheran) is located here. Pop. (1900) 3,841.

Mechanicsville, mē-kan'iks-vīl, N. Y., village, in Saratoga County; on the Hudson River and the Champlain Canal, and on the Delaware & H., and Boston & M. R.R.'s; about 20 miles north of Albany. The water-power is extensive. Power is transmitted from Mechanicsville to manufacturing establishments in Schenectady. Some of the manufacturing establishments of Mechanicsville are knitting mills, sash and blind factories, paper and pulp mills, and machine shops. The village owns and operates the waterworks. Pop. (1890) 2,679; (1900) 4,695.

Mechanicsville, Battle of (also called Battle of Beaver Dam Creek). After the battle of Oak Grove (q.v.) 25 June 1862, the Army of the Potomac was thrown upon the defensive by the sudden appearance of "Stonewall" Jackson on its right. North of the Chickahominy McClellan had but one corps in position, that of Fitz-John Porter, temporarily strengthened by McCall's division of Pennsylvania Reserves. McCall held the extreme right of the line at Mechanicsville and Beaver Dam Creek, with three brigades and five batteries of 26 guns. His main position was along the east bank of the creek, a tributary of the Chickahominy, and was very strong, his left resting on the Chickahominy, his right and advance extending to a body of woods near and overlooking Mechanicsville, held by a regiment and a battery. Rifle-pits had been constructed for the infantry, epaulements had been thrown up to cover the guns, and a strong picket-line was in front from Mechanicsville Bridge to Meadow Bridge along the Chickahominy. A. P. Hill's Confederate division and Cobb's Legion were in plain view from the left, intrenched on the opposite side of the Chickahominy. About noon of the 26th Hill's men were seen in motion. At 12:30 the Union pickets at Meadow Bridge were driven in, and McCall formed line; Reynolds' brigade on the right, covering the crossing of the road from Mechanicsville to Bethesda Church; Seymour on the left, covering at Ellerson's Mill the crossing of the road from Mechanicsville to Gaines' Mill; and Meade's brigade, with two batteries in reserve. A. P. Hill had 14,000 men in his division, which he had concentrated near Meadow Bridge, under orders from Gen. Lee to co-operate with Jackson, who was marching from Ashland to turn McClellan's right. Hill sent Branch's brigade and a battery to cross the Chickahominy seven miles above Meadow Bridge and communicate with Jackson's advance, and when Jackson had crossed the Virginia Central Railroad, Branch was to cross the Chickahominy, push down the river and uncover Meadow Bridge, which Hill was to cross at once and then sweep down to Mechanicsville, uncovering in turn the Mechanicsville Bridge, which Longstreet's and D. H. Hill's divisions

MECHITARISTS — MECKLENBURG COUNTY

were to cross, when all were to push down the left bank of the Chickahominy and cut off McClellan's communications with his base at White House on the Pamunkey, and thus force him to abandon his operations against Richmond and retreat down the Peninsula. Jackson was behind his appointed time, and it was 10 o'clock before Branch opened communication with him. Hill grew impatient as the hours went by and nothing was heard from Branch or Jackson, and at 3 P.M. put his five brigades and six batteries in motion. Field's brigade seized Meadow Bridge and crossed, closely followed by the brigades of J. R. Anderson and Archer. The brigades of Gregg and Pender then crossed and marched across the country to support the right of the attacking column. Field's advance was met by a severe artillery fire; but, forming line, with Pegram's battery in the centre, it forced the Union advance of a regiment and battery from Mechanicsville back to the main line beyond Beaver Dam Creek. It had not been Gen. Lee's intention to attack McCall in position, but to have Jackson turn it. Jackson was not up in time; McClellan would doubtless penetrate his design and make a counter attack against Richmond; time was everything; the day was declining, and Lee ordered A. P. Hill to attack. The brigades of Field, Archer, and Anderson were ordered to advance on the Mechanicsville road against Reynolds. They were met by a withering fire of artillery and musketry, and were bloodily repulsed, though one of Anderson's regiments on the left succeeded in making a temporary lodgment beyond the creek. Parts of Porter's corps now came up and strengthened Reynolds' right. Following the repulse on the left, Pender's brigade and Ripley's of D. H. Hill's division made a most determined attack upon Seymour at Ellerson's Mill, but a mill-race, swampy ground, and other obstacles were in their way, and Seymour's direct and Reynolds' flank fire checked and then repulsed them with great loss. The attack was renewed, and a still more bloody repulse was the result, some of the regiments losing all their field officers and half their men. It was now sunset, and no further effort was made to assault the position, but the firing was kept up until 9 P.M. On the next morning McCall was ordered to fall back to Gaines' Mill (q.v.). The Union loss was 49 killed, 207 wounded, and 105 missing. The Confederate loss, killed and wounded, was over 1,500; Longstreet says between 3,000 and 4,000 killed, wounded and missing, which is probably excessive. Longstreet further says: "Next to Malvern Hill, the [Confederate] sacrifice at Beaver Dam was unequalled in demoralization during the entire summer." Consult: 'Official Records,' Vol. XI.; 'McClellan's Own Story'; Webb, 'The Peninsula'; Allan, 'History of the Army of Northern Virginia'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. II.

E. A. CARMAN.

Mechitarists, mēk-ī-tār'ists, a sect of Armenian Christians acknowledging the authority of the pope, but retaining their own ritual. The name originated from Mechitar Da Petro, who in 1701 founded a religious society at Constantinople for disseminating a knowledge of Armenian literature. They soon removed to the Morea, whence in 1715 they went to Venice, and later to the island of San Lazzaro.

Mechlin, mēk'lin (Dutch, mēh'lin), or **Malines**, mā-lēn, Belgium, a city on the Dyle, 14 miles southeast of Antwerp. The ancient walls and moat have been replaced by a wide boulevard and canal, the streets are wide and regular, and it has fine squares and public buildings. It is the see of the Primate of Belgium and has numerous churches. St. Rombold's Cathedral, a vast building covering nearly two acres, was built in 1437-52 the clock-tower, however, 324 feet high, remains unfinished; the cathedral contains Van Dyck's 'Crucifixion.' The churches of St. John and Our Lady contain works by Rubens; the town hall dates from the 15th century; the Cloth Hall, now used as a guard-house, from 1340, while also noteworthy are the modern archiepiscopal palace, the Beguinage, and the Salm Inn (1534). The manufacture of pillow lace and of cloth, so famous in the 15th, 16th, and 17th centuries, has been largely transferred to Brussels; the chief industries now are carpentry, cabinet making, brewing, horticulture and agriculture; extensive railway works have been established here. Pop. (1901) 56,013.

Mecklenburg, mēk'lēn-boorg, Germany, a territory on the Baltic Sea, a former Saxon province, now divided into the grand-duchies of MECKLENBURG-SCHWERIN and MECKLENBURG-STRELITZ.

(1) Mecklenburg-Schwerin, bounded on the north by the Baltic Sea, elsewhere chiefly by Prussia and Mecklenburg-Strelitz, has an area of 5,135 square miles. The capital is Schwerin. The surface is flat, except where a ridge of low hills forms the watershed between the Elbe and the Baltic. The sea-coast is indented by several inlets. The streams flow partly to the Elbe, partly to the Baltic; there are numerous lakes. The chief products are corn, pease, beans, potatoes, beets, and turnips. Both horses and cattle are exported. Distilling is largely carried on. The government is intimately connected with that of Mecklenburg-Strelitz. Each duchy has a separate legislative body, but both meet annually, and legislate for the whole of Mecklenburg. Pop. (1900) 607,835.

(2) Mecklenburg-Strelitz, divided by Mecklenburg-Schwerin into two large districts, the circle or lordship of Stargard, and the principality of Ratzeburg, both on the east, and on the west in several smaller districts, existing in separate patches, has an area of 1,131 square miles. The physical features and productions are the same as those of its larger neighbor. Pop. (1900) 102,628.

Mecklenburg (mēk'lēn-bērg) County, N. C. The story of Mecklenburg County in North Carolina involves a story of three races of people, namely, the Indian, the white man and the negro. Without ever having a definite purpose to do so the white man drove out the Indian. Having always a definite purpose to Christianize and civilize the Indian, the white race, contrary to its purpose, exterminated the red race. This was accomplished in effect in the first half of the 18th century. The early white settlers were mainly Scotch, Irish, German and English. The first vocations of the white settlers were in the main agriculture, but from the first settlements such arts as smithing, wheel-wrighting, spinning and weaving were practised. These and other primitive manufactures were rapidly developed and enlarged. In the second half of the 18th

MECKLENBURG DECLARATION — MEDAL

century the Piedmont region of the South became more flourishing in manufactures than any other part of the Union. Blast furnaces, rolling mills, machine shops, woolen factories, cotton factories, hat factories, wagon and carriage factories, gun shops and many other manufacturing interests grew in numbers and importance. The colonists built to great prosperity. They felt hampered by restrictions of the king and parliament in England. They resisted these restrictions. Increasing discontent made increased resistance. On 20 May 1775 a convention of Mecklenburg County met in Charlotte and made a declaration of Independence of the King. On 31 May following a series of resolutions were passed defining a method of government of the county by its own people.

In 1793 Whitney of New Haven, Conn., invented the cotton gin. In 1795 Holmes of Hamburg, S. C., improved the Whitney gin by introducing saws in place of wire spikes, making it practical. In 1800 the gin had become generally introduced into Mecklenburg County. From this time forward manufactures diminished in importance, while agriculture in the form of cotton production increased in importance. Here the third race, the negro, became a factor of growing importance. Slaves were brought from Northern States to put in the cotton fields and also imported from Africa. Agriculture with slave labor became of more and more importance, while manufactures and commerce became of less and less importance. By 1830 the county had become wholly one of agriculture, and slavery had become dominant. The former skilled white labor emigrated largely to what was then the Northwest Territory. Another tide of emigration turned to the Southwest, where land could be found to further employ slave labor in the production of cotton, rice and sugar. Immigration of white people stopped. The white labor left were relegated to farms more or less exhausted by unscientific agriculture and these became what some people called the "poor whites" of the South.

Civilization demanded the abolition of slavery. Slaveholders opposed this and controlled a following which postponed the event and tended to isolate the territory in which slavery was the controlling influence. Constant pressure of the subject brought Secession, the War, abolition. The Civil War was destructive. The fall of slavery was more destructive. The investment of freedmen with franchise and other privileges to which they were wholly unaccustomed and for which the race was, at least at that time, unfit, brought a period of semi-anarchy. On the re-establishment of good government manufactures which had languished throughout the period of slavery were re-established. Commerce revived. A system of public education was established. Emigration ceased. Immigration set in again. Before the time of slavery the county made great progress. During the time of slavery the county stood still. After the time of slavery the county again makes great progress.

Some of the principal events of the county have been the following:

First White Settlements, 1720.
Creation of Mecklenburg County, 1762.
Declaration of Independence, 20 May 1775.
Beginning of Charlotte, 1765.
Andrew Jackson born, 15 March 1767.
James Knox Polk born, 2 Nov. 1795.

United States Mint, branch mint established 1837.
Macadam Road Building begun 1884.
First Cotton Mill, 1881.
First Cottonseed-oil Mill, 1882.

D. A. TOMPKINS.

Mecklenburg (mĕk'lĕn-bĕrg) Declaration, in American history, a series of rebellious resolutions adopted 20 May 1775, at Charlotte, Mecklenburg County, N. C., by a convention held at midnight, and representing each militia company in the county. The resolutions declared that the people of Mecklenburg County were free and independent of the British crown, and not only was the general tenor that of the Declaration of Independence, but many phrases in the resolutions are word for word as they appear in that document. The minutes of the midnight meeting are said to have been destroyed by fire in 1800. Whether the Declaration of Independence followed the words of the Mecklenburg Declaration, or whether the latter, having probably been replaced from memory, was tinged with the former, is a disputed question. Consult Cooke, 'Revolutionary History of North Carolina' (1853); Draper, 'The Mecklenburg Declaration' (1874).

Meconic Acid, an organic acid occurring in opium, and having the formula $C_{20}H_{27}O_5(OH)(COOH)$. In preparing it, the opium is exhausted with water at 100° F., the infusion is neutralized with calcium carbonate and evaporated to a syrup, and calcium meconate is precipitated by adding a concentrated solution of calcium chloride. Two crystallizations from hot dilute hydrochloric acid follow, and the free acid is then deposited in the form of small scales, containing three molecules of water. Upon heating to 212° F. the hydrated crystals lose their water, and become white. Meconic acid is readily soluble in alcohol, but only slightly so in ether and in cold water. It has a sour taste and a pronounced acid reaction, and its solutions are turned red by ferric chloride, $FeCl_3$. Meconic acid forms numerous salts ("meconates"), as well as various organic derivatives; but none of these is of importance in the arts.

Medal, a piece of metal in the form of a coin, stamped with a figure or device to preserve the portrait of some eminent person, or the memory of some illustrious action or event. Medals belong to two periods, ancient and modern, separated by a wide interval. Early Greek and Roman medals were struck for prizes in athletic games, or in commemoration of great events. The Roman series of medals or medallions is very extensive in gold, silver and brass or copper. The gold medals begin with Constantine and continue to the fall of the empire; the silver begin under Gallienus and continue as long; the copper from Augustus to Alexander Severus.

In more modern times the art of medal-making has been brought to great perfection, and most of the principal nations have adopted the plan of preserving their history by these durable monuments. The French series is deserving of special mention as the most perfect and complete in the world. It commences under Louis XI., and continues to the present date, illustrating every important event in the history of France. The English series commences under Henry VIII., but as works of art the medals have not high rank. The British battle medals,

MEDAL OF HONOR—MEDANO

however, form an admirable series. The Italian and German medals of modern date are very fine. The mediæval are interesting and bold in design, but rude in execution. The papal series, commencing with Paul V., are worthy of attention.

One of the earliest American medals is that presented to General John Armstrong for his successful attack in 1756 on the Indians at Kittingtanning. Most of those struck during the Revolution were made in France. The next American medal of which there appears to be any record is that which was presented to General Gates after the surrender of Burgoyne, 17 Oct. 1777. On 25 March 1776, when news of the British evacuation of Boston reached Congress, that body resolved that its thanks be presented to the Commander-in-Chief, and that a gold medal be struck in commemoration of the event. This medal was nearly two and three quarter inches in diameter. On one side was a profile head of Washington, with the legend in Latin: "The American Congress to George Washington, the Commander-in-Chief of its armies, the assertor of freedom." On the reverse the device showed troops advancing toward a town, others marching toward the water, ships in view, General Washington in front, mounted, with his staff, whose attention he is directing to the embarking enemy. The legend is: "The enemy for the first time put to flight." Then, too, at the time of his death, among minor honors paid to the great general's memory, was the publishing of a silver commemorative medal.

There is the record of one medal only granted by Congress in commemoration of any naval victory during the War of the Revolution, and that was a gold one presented to Paul Jones for his defeat of the British frigate *Scapis* when commanding the *Bonhomme Richard*, 23 Sept. 1779. Other gold medals were those presented to Commodore Perry and Lieutenant Jesse D. Elliot for the part which they took in the battle of Lake Erie, 8 Oct. 1812; to Captain Lawrence, who, in command of the *Hornet*, 24 Feb. 1813, captured the British brig *Peacock*; to Captain Warrington of the *Peacock*—then under the Stars and Stripes—for the capture of the *Epervier*, 20 April 1814; to Captain Thomas Macdonough, who commanded the American squadron in Plattsburg Bay, August 1814; to Captain Decatur, who, in command of the United States, captured the British frigate *Macedonian*, 25 Oct. 1812; and to Captain Jones and Captain Blakely, who, when commanding the *Wasp*—the one, 12 Oct. 1812, and the other 28 June 1814—captured respectively the *Frolic* and the *Reindeer* from the British navy.

The giving of medals went out of fashion after the second war with Great Britain, and but little was done by the government during the War of the Rebellion. Major Robert Anderson received two medals for his gallant defense of Fort Sumter, but one was presented by the citizens of New York and the second by the Chamber of Commerce of the same city. After the successful operations by Grant in East Tennessee and at Chattanooga, Congress voted him thanks and a gold medal with suitable emblems, devices and inscriptions. It is worthy of remark that no less than 189 medals were struck in honor of Abraham Lincoln, and later medals have been issued in memory of Garfield and McKinley, and in honor of Sampson, Schley,

Dewey, and others in the Spanish-American War. See also COINAGE; NUMISMATICS; TOKENS.

WILL M. CLEMENS.

Medal of Honor, United States Military, an honor bestowed upon army and navy officers and men for specific services; regarded as a higher token of the war hero than the Victoria Cross of England, the medal of the Legion of Honor of France, or the Iron Cross of Germany. It is given not for the sheer performance of duty, no matter how hazardous that duty may be, but for some voluntary act of valor, beyond the bounds of mere obedience to orders. Out of the 5,000,000 men who have battled for the United States in the different wars this country has had, the vast majority, as history shows, performed their duty. Out of these 5,000,000, however, have been 2,000 men who have done more, who have braved dangers when they were not expected to brave them, overcome difficulties that were regarded by the rest as insurmountable, and faced death when it seemed it meant the sacrifice of their own lives. Many are the ways these medals have been won. By the Act of 12 July 1862 the United States government authorized the striking of 2,000 medals to be given to non-commissioned officers and privates for gallantry in action and soldier-like qualities. On 3 March 1863 the sum of \$20,000 was appropriated for making the medals, and officers were made eligible to receive them. Medals were also authorized by Congress in recognition of acts of bravery performed (during the war with Spain in 1898) in the naval battles of Manila and Santiago, the Manila medals bearing the portrait of Admiral Dewey, and the Santiago medals a portrait of Rear-Admiral Sampson. The medal is a bronze five-pointed star within a circle of stars, suspended by a trophy of two crossed cannons surmounted by an eagle, united by a ribbon of 13 stripes of red, white and blue.

Medal of Honor Legion, an association of officers and enlisted men of the Union army, who during the Civil War were awarded medals of honor for special acts of bravery and devotion. The association has 1,000 members among the army veterans and 200 among naval veterans. The meetings are held annually.

Medallion, mē-dāl'yōn. (1) The term medallion in numismatics is applied to those productions of the mint of ancient Rome, or struck in the provinces under the empire, which, if gold, exceed the *aureus* in size; if silver, the *denarius*; and if copper, the first or large brass. Medallions are not numerous. Those struck in the Greek provinces are more common than the Roman, but of inferior workmanship. A beautiful and famous gold medallion exists of Augustus, and one of Domitian, but few, in any metal, are found prior to the reigns of Hadrian and Antonine; those in brass are the largest, many of them being several inches in diameter, and for the most part of admirable workmanship. (See MEDALS.)

(2) In architecture, an oval panel carved in bas-relief. The same term is used for a color design.

Medano, mā-dā'nō, the Spanish name for peculiar moving sand-hills in Peru. They are seen on the plain of Islay near Arequipa, and are crescent-shaped bodies of white sand, which move across the desert in the direction of the

winds which blow from sunrise to sunset. The sand composing the medano seems different from the desert sands over which the moving mass is blown or carried.

Medary, Samuel, American editor and politician: b. Montgomery Square, Montgomery County, Pa., 25 Feb. 1801; d. Columbus, Ohio, 7 Nov. 1864. In 1825 he settled at Batavia, Clermont County, Ohio, and in 1828 established the 'Ohio Sun' in support of Jackson's candidacy for the presidency. He sat for Clermont County in the State house of representatives in 1834-5, and was a member of the State senate in 1835-7. In 1837 he purchased at Columbus the 'Western Hemisphere,' later the 'Ohio Statesman,' which he edited until 1857. In 1857-8 he was governor of Minnesota territory, and in 1858-9 of Kansas territory. He established the 'Crisis' at Columbus in 1860, and was its editor until his death. He gave active aid to Morse in the promotion of the electric telegraph, was a firm supporter of the measures of Jackson and Douglas; is said to have originated the battle-cry "Fifty-four forty, or fight!" in connection with the Oregon boundary dispute; and was often called the "old wheel-horse of Democracy."

Medea, me-dē'a, a powerful sorceress of the Greek heroic age, daughter of Æetes, king of Colchis. By some her mother is said to have been Idyia, daughter of Oceanus; by others Hecate or Neera. By her profound knowledge of the magical virtues of plants she practised witchcraft. She became the wife of Jason (q.v.), the leader of the Argonauts. For 10 years she lived with him after having supported him in every danger, till the charms of Glauce, or Creusa, the daughter of King Creon, kindled a new passion in him, and he discarded Medea, who brooded on revenge. With this purpose she sent the bride, as a wedding gift, a poisoned garment, also a poisoned crown of gold, which Glauce put on and died in agony. The sorceress reduced Creon's palace to ashes by a shower of fire, murdered her two children by Jason, and then mounted her dragon chariot and escaped. Some say that she went to Hercules, others to Athens, to King Ægeus, by whom she had Medus. From Athens also she was banished as a sorceress. She finally returned to her home, where her son Medus reinstated her father, who had been dethroned by his brother Perses, after which she died. The story of Medea has often been a subject of tragic poetry ancient and modern. The tragedies of this name, by Æschylus and Ennius, have perished, as well as the Colchides of Sophocles. The Medæas of Euripides and Seneca are alone extant. The story has also been dramatized by Corneille and Grillparzer. Cherubini made this myth the subject of an opera.

Medellin, mā-dēl-yēn', Colombia, Central America, a city, the capital of the department of Antioquia, and an episcopal see, picturesquely situated in a mountain valley 4,850 feet above sea-level on the Porce, an affluent of the Canca, 150 miles northwest of Bogota. It was founded in 1674, and has a cathedral, college, seminary, technical school, mint, hospital, and other public buildings. The development of the gold and silver mines in the region has contributed largely to its modern progress. It has manufactures of pottery, porcelain ware and jewelry, and has a

considerable trade, exporting gold, silver, coffee, and hides. Pop. (1900) 40,000.

Medford, mēd'fōrd, Mass., city, in Middlesex County; on the Mystic River, and on the Boston & Maine railroad; five miles northwest of Boston. The area is about 10 square miles. It was founded in 1630 by people from Salem who called the place Meadford. In 1892 it was chartered as a city having within its limits the villages of South Medford, West Medford, Hillside, Glenwood, and Wellington. It is a residential suburb of Boston, but it has some important industrial interests, chief of which are the manufacturing of machinery, cotton goods, dyes, rum, chemicals, carriages, brick, and novelties. It is the seat of Tufts College (q.v.), and has the city and the college libraries. The Cradock House, built in 1634, is one of the oldest, if not the oldest building in the United States which retains its original form. The city has four large and several small parks. Oak Grove, the largest of its three cemeteries, has an area of 34 acres.

The charter granted in 1892 is still in force and provides for the administration of the municipality by a mayor, who holds office two years, and a council made up of the board of aldermen and the common council. The administrative officials are appointed by the mayor or elected by the council. The board of education is chosen by popular vote. Pop. (1890) 11,079; (1900) 18,244. Consult: Usher, 'History of the Town of Medford, Mass.'

Medford, Wis., city, county-seat of Taylor County, on the Black River, and on the Wisconsin Central railroad; about 60 miles northeast of Eau Claire. It is in an agricultural and lumbering region. The chief manufactures are cheese, foundry products, lumber, and leather. It has considerable trade in lumber, leather, and cheese. Pop. (1900) 1,758.

Medhurst, mēd'hērst, **Walter Henry**, English oriental scholar and missionary: b. London 1796; d. there 24 Jan. 1857. He was educated for the ministry, and in 1816 made a missionary tour through India and Malacca, establishing himself in 1822 in the island of Java, where he remained eight years. During this interval and for several years afterward he pursued his missionary labors also in Borneo and on the coasts of China. In 1843 he settled in Shanghai and subsequently passed six years in the interior of China. He was an intelligent student of the languages and literatures of eastern Asia, being well versed in the Chinese, Japanese, Javanese, and other dialects, beside Dutch, French, and English, in all of which he wrote. Beside a Chinese version of the Bible, he published 'Chinese Repository' (20 vols. 1838-51); 'Chinese and English Dictionary' (1842-3); 'English and Chinese Dictionary' (1847-8); 'English and Japanese Vocabulary' (1830); 'Dictionary of the Hokkien Dialect' (1832-9); 'Translation of a Comparative Vocabulary of the Languages of China, Corea, and Japan' (1835); 'Notes on Chinese Grammar' (1842); 'Chinese Dialogues' (1844); 'China in its State and Prospects' (1838); etc.

Media, mē'dī-a, Asia, an ancient kingdom and country of considerable extent, now comprised in the provinces of northwest Persia. It was originally inhabited by a Turanian race, who are called Medes by ancient writers; but this

MEDIA — MEDICAL COLLEGES FOR WOMEN

name properly belongs to an Aryan race, who had spread themselves widely in the high regions of Western Asia, and ultimately established their ascendancy in Media. They have been traced both by Persian and Indian traditions to the countries beyond the Indus. The history of Media is involved in considerable obscurity, but careful modern investigations have made the main outlines fairly clear. The Medes are first mentioned in connection with some of the kings of Assyria from the 9th century B.C. Rammān-nirari II. of Assyria, who reigned about 810 B.C., led expeditions into Media, and in 713 the great King Sargon conquered the country and made the Median princes tributary to the Assyrian monarchy. According to the Assyrian inscriptions, one of the Median rulers named Dajaukku was carried off as a prisoner in 715 B.C.; this Dajaukku is the same as the Deioeces who, according to Herodotus, founded the Median kingdom on an independent basis and fixed his capital at Ecbatana (now Hamadan). Deioeces was followed by three kings in succession, bearing the names (in Greek) of Phraortes, Cyaxares, and Astyages. Phraortes, to whom the Greek historian assigns a reign of 22 years (647-625 B.C.), began the extension of the Median empire by the subjugation of the mountainous region of Persis, to the southeast of Media. He then conquered other parts of Asia, and at length ventured to take the aggressive against the Assyrians and attack Nineveh. In this attempt he failed and lost his life. Cyaxares succeeded him on the Median throne, and during a reign of 40 years raised his kingdom to the greatest power and importance it was destined to achieve. He thoroughly reorganized the army and advanced against Nineveh. He gained several successes, but before he could take the Assyrian capital he had to return to defend his kingdom against the inroads of Scythians. At first the Scythians carried all before them and became virtually masters of Media, but Cyaxares temporarily secured his position by negotiating with them, and finally slew all their chiefs when they were overpowered by wine at a feast. Thus rid of Scythian authority, Cyaxares again advanced against the Assyrians. In conjunction with Nabopolassar, founder of the Neo-Babylonian empire, he captured Nineveh about the year 606 B.C. After this event the Assyrian dominions were partitioned between the two conquerors, the northern parts falling to Media and the southern portions to Nabopolassar. Nebuchadrezzar, son and successor of Nabopolassar, married a daughter of Cyaxares. Cyaxares carried his arms into Asia Minor and waged war for five years against Alyattes, king of Lydia. On 28 May 585, the Median and Lydian forces were engaged in battle when a total eclipse of the sun took place and struck terror into the soldiers on both sides. This event disposed both sides to enter into peace negotiations, which were successfully carried through by the agency of Nebuchadrezzar and Syennesis, prince of Cilicia. Cyaxares probably died very shortly after this event, and left to his successor a greatly extended empire. Astyages was the last independent king of Media, and from 550 B.C., when he was conquered by Cyrus the Persian, Media formed part of the Persian empire.

Media, Pa., borough, county-seat of Delaware County; on the Philadelphia, Wilmington

& Baltimore railroad; about 15 miles west of Philadelphia. It is a well-built, well-kept residential suburb of Philadelphia, and is situated in a fertile agricultural region. It is the headquarters for the Delaware County Institute of Science, established in 1833. The Institute has a library of about 5,500 volumes, and the borough library has about 3,500 volumes. The street-lighting plant and the waterworks are owned and operated by the borough. Pop. (1900) 3,075.

Me'diatiza'tion, a term applied especially to the process by which, on the dissolution of the German empire in 1866, the smaller princes who had depended immediately on the empire were subjected to the authority of the princes of the Confederation of the Rhine, and became *mediatized* or dependent members of that confederation, or otherwise became dependent upon more important German states.

Medical Association, American. See AMERICAN MEDICAL ASSOCIATION.

Medical Code, a set of regulations adopted by a medical association outlining the conduct of members of the profession. The various codes prohibit advertising in public prints, as well as the endorsement of proprietary or secret remedies. The ethics of both "regular" and homœopathic schools define the relations of patient and physician and of attending and consulting physician, and provide that a physician shall attend the immediate family of a brother physician without charge, except when unusual labor, expense, or exposure is involved. The medical code in this country was founded on the English code of medical ethics prepared by Thomas Percival in 1803. In 1847 the American Medical Association adopted a general code which superseded codes existing in several States, and which was unopposed till 1882. In the latter year a majority of the members of the New York County Medical Society voted to disobey the provision of the code which forbade them to consult with any but "regular" physicians, claiming the right to consult with any physicians that the legislature of each State decided to be legally qualified. Similar action was taken by a majority of the members of the New York Academy of Medicine. This antagonism affected the whole profession in this country, and the immediate result was the formation of New York county and State associations, whose delegates were received by the American Medical Association to the exclusion of those from the old societies. In 1903 steps were taken to heal their differences and unite the rivals into one body, with the code so modified in effect as to allow individual liberty in the matter of consultation. Consult Flint, 'Medical Ethics and Etiquette' (1883).

Medical Colleges for Women. In the United States in 1903, over 1,200 women were students in the various medical colleges. In Philadelphia the Woman's Medical College of Pennsylvania, the only institution of the kind in this country, has met with marked success. In 1903, there had been to date a total graduation from this college of 244 students, and an effort was made to trace the careers of these graduates. Of this number 166 responded affirmatively to the question, Are you now engaged in active medical practice? Twenty-three responded in the negative, giving as rea-

winds which blow from sunrise to sunset. The sand composing the medano seems different from the desert sands over which the moving mass is blown or carried.

Medary, Samuel, American editor and politician; b. Montgomery Square, Montgomery County, Pa., 25 Feb. 1801; d. Columbus, Ohio, 7 Nov. 1864. In 1825 he settled at Batavia, Clermont County, Ohio, and in 1828 established the 'Ohio Sun' in support of Jackson's candidacy for the presidency. He sat for Clermont County in the State house of representatives in 1834-5, and was a member of the State senate in 1835-7. In 1837 he purchased at Columbus the 'Western Hemisphere,' later the 'Ohio Statesman,' which he edited until 1857. In 1857-8 he was governor of Minnesota territory, and in 1858-9 of Kansas territory. He established the 'Crisis' at Columbus in 1860, and was its editor until his death. He gave active aid to Morse in the promotion of the electric telegraph, was a firm supporter of the measures of Jackson and Douglas; is said to have originated the battle-cry 'Fifty-four forty, or fight' in connection with the Oregon boundary dispute; and was often called the 'old wheel-horse of Democracy.'

Medea, me-dē'a, a powerful sorceress of the Greek heroic age, daughter of Æetes, king of Colchis. By some her mother is said to have been Idyia, daughter of Oceanus; by others Hecate or Neera. By her profound knowledge of the magical virtues of plants she practised witchcraft. She became the wife of Jason (q.v.), the leader of the Argonauts. For 10 years she lived with him after having supported him in every danger, till the charms of Glauce, or Creusa, the daughter of King Creon, kindled a new passion in him, and he discarded Medea, who brooded on revenge. With this purpose she sent the bride, as a wedding gift, a poisoned garment, also a poisoned crown of gold, which Glauce put on and died in agony. The sorceress reduced Creon's palace to ashes by a shower of fire, murdered her two children by Jason, and then mounted her dragon chariot and escaped. Some say that she went to Hercules, others to Athens, to King Ægeus, by whom she had Medus. From Athens also she was banished as a sorceress. She finally returned to her home, where her son Medus reinstated her father, who had been dethroned by his brother Perses, after which she died. The story of Medea has often been a subject of tragic poetry ancient and modern. The tragedies of this name, by Æschylus and Ennius, have perished, as well as the Colchides of Sophocles. The Medæas of Euripides and Seneca are alone extant. The story has also been dramatized by Corneille and Grillparzer. Cherubini made this myth the subject of an opera.

Medical Department, U. S. Navy. See NAVY OF THE UNITED STATES, THE.

Medical Education. Before the establishment of medical schools in this country medical students either went abroad to study or served an apprenticeship with some practising physician. The latter custom was common in view of the expense incident to work abroad, and continued till very recently. As a rule the apprentice had little opportunity for study, but was forced to depend on what he could absorb by contact with his preceptor. The physicians of the 17th and 18th centuries who had studied abroad were usually classical students and in their preliminary training set an example that it would have been wise to follow. The first public lectures on anatomy before a class of students in this country are said to have been delivered by Dr. William Hunter of Newport, R. I., in 1752. It seems, however, that Dr. Giles Firmin as early as 1647 delivered readings on human osteology in New England; that Dr. Thomas Cadwallader of Philadelphia gave instruction to students in anatomy between 1745 and 1751; and that Drs. John Bard and Peter Middleton dissected the human body in New York city in 1750 for purposes of medical instruction. In 1762 Dr. William Shippen of Philadelphia gave a course of lectures on anatomy, illustrated by actual dissections. These lectures were continued till the organization of the Medical College of Philadelphia (now the medical department of the University of Pennsylvania) in 1765. Dissections were rarely performed prior to 1760 and even autopsies were seldom permitted. At the time of the American Revolution, with a population of 3,000,000, there were probably about 3,500 physicians in the colonies, of whom it is estimated that not more than 400 had received medical degrees. In New England the clergyman was often the only available physician. Two medical schools were organized in the Colonies, the Medical College of Philadelphia (now a department of the University of Pennsylvania) in 1765, and the medical department of King's (now Columbia) College, in 1768. The first medical degree conferred in this country, that of bachelor of medicine, was granted to 10 men by the Medical College of Philadelphia in 1768. The degree of doctor of medicine was first conferred in 1770 by the medical school of King's College on two students who had taken the bachelor's degree in 1769. Fifty-one medical degrees had been conferred by these institutions before 1776, when operations were suspended by the war. In the colonial period two medical societies (the State Medical

Society of New Jersey, in 1766, and the Delaware State Medical Society, in 1776) and one permanent general hospital were organized. Harvard University Medical School was organized in 1782, Dartmouth Medical College in 1797, the School of Medicine of the University of Maryland and the College of Physicians and Surgeons of New York in 1807. In 1813 the medical department of Columbia College was finally discontinued; the College of Physicians and Surgeons took its place in 1860. Of the 148 medical schools now existing in the United States and registered by the University of the State of New York 3 were established between 1765 and 1800, 12 between 1801 and 1825, 19 between 1826 and 1850, 29 between 1851 and 1875, 80 between 1876 and 1900, 5 between 1901 and 1904.

At the time of the organization of the early medical schools the practice of obstetrics was relegated as a rule to ignorant midwives; physiology, histology, organic chemistry, pathology, and surgery, as now recognized, were hardly known. The schools at first conferred the degree of bachelor of medicine on those who had studied two years with a preceptor and attended one course of lectures, the degree of doctor of medicine after three years of study and two courses of lectures. The bachelor's degree was abandoned in 1813. At first the Medical College of Philadelphia required for admission some knowledge of Greek and Latin, physics, natural history, and botany, but the requirement was abandoned about the time of the reorganization of the University of Pennsylvania in 1792. For a century there were as a rule practically no requirements in preliminary general education for admission to medical schools, and even today this is their greatest defect.

In 1839 the New York State Medical Society resolved that teaching and licensing ought to be separated as far as possible. Further discussion of this question led to a convention of delegates from all medical schools and societies in the United States, held in New York in 1846; from it sprang the American Medical Association. This national organization, thoroughly representative in character, gave a new impetus to medical societies. The following societies have exercised an important influence in promoting higher standards: Association of American Medical Colleges (1890); American Institute of Homœopathy (1844); National Confederation of Eclectic Medical Colleges (1871); Southern Medical College Association (1892). These prescribe for admission to medical schools a preliminary general education equivalent to one year in a high school. All prescribe four courses of lectures in different years as a condition for an M.D. degree, though they give an allowance of one year to graduates of reputable literary colleges and of other professional schools. All tend to improve facilities for teaching, dissections, and clinics. The schools registered by these societies are 72, 19, 7, and 13 respectively.

In 1859 the Chicago Medical College, now the medical department of Northwestern University, was established to test the practicability of a thorough graded system of instruction. Students were divided into three classes, and each class was examined at the close of the year. Each of the three courses was six months in duration. Attendance on hospital clinical instruction and practical work in the chemical,

MEDICAL EDUCATION

anatomic and microscopic, or histologic laboratories were required for graduation. In 1871 the Harvard Medical School adopted a similar plan. The Syracuse Medical School followed, and to-day the graded system of consecutive lectures is the rule. In 1896 President Eliot wrote substantially as follows: Within 25 years the whole method of teaching medicine has been revolutionized throughout the United States. The old medical teaching was largely exposition; it gave information at long range about things and processes which were not within reach or sight at the moment. The main means of instruction were lectures, surgical exhibitions in large rooms appropriately called theatres, rude dissecting rooms with scanty supervision, and clinical visits in large groups. The lectures were repeated year after year with little change, and no graded course was laid down. There was little opportunity for laboratory work. The new medical education aims at imparting manual and ocular skill, and cultivating the mental powers of close attention through prolonged investigations at close quarters with the facts, and of just reasoning on the evidence. The subjects of instruction are arranged, as at the Harvard Medical School, in a carefully graded course, which carries the student forward in an orderly and logical way from year to year. Laboratory work in anatomy, medical chemistry, physiology, histology, embryology, pathology, and bacteriology demands a large part of the student's attention. In clinical teaching, also, the change is great. Formerly a large group of students accompanied a visiting physician on his rounds, and saw what they could under very disadvantageous conditions. Now instruction has become, in many clinical departments, absolutely individual, the instructor dealing with one student at a time, and personally showing him how to see, hear, and touch for himself in all sorts of difficult observation and manipulation. Much instruction is given to small groups of students, three or four at a time—no more than can actually see and touch for themselves.

In 1902 there were, excluding graduate schools, 154 medical schools in the United States with 26,821 students. The growth in medical students in 32 years has been 333 per cent. Of the 154 schools 123 are regular (24,447 students), 20 homoeopathic (1,551 students), 9 eclectic (746 students), and 2 physiomedical (77 students). Of the 154 medical schools, 143 held day sessions, 6 had evening sessions, and 5 did not report this item; 76 were departments of colleges or universities, 78 were separate institutions; 150 granted degrees.

More attention should be paid in the United States to instruction in hygiene and state medicine. In Great Britain no one can be appointed a medical officer unless he has a special diploma in public health. In this country little opportunity is afforded for general or special sanitary work on broad lines. This subject is now under discussion and doubtless progressive States will soon provide places where medical officers of health or other persons engaged in sanitary work can obtain practical and scientific training. The scientific investigations which would be made in the laboratories of such schools would be of great value to the public.

The earliest law relating exclusively to physicians was passed by Virginia in 1639, but like the later act of 1736 it was designed mainly

to regulate their fees. The act of 1736 made concessions to physicians who held university degrees. In only two of the 13 colonies were well-considered laws enacted to define the qualifications of physicians. The general assembly of New York in 1760 decreed that no person should practise as physician or surgeon in the city of New York till examined in physic and surgery and admitted by one of his majesty's council, the judges of the supreme court, the king's attorney-general, and the mayor of the city of New York. Such candidates as were approved received certificates conferring the right to practise throughout the whole province, and a penalty of £5 was prescribed for all violations of this law. A similar act was passed by the general assembly of New Jersey in 1772. In 1840 laws had been enacted by the legislatures of nearly all the States to protect citizens from the impositions of quacks. Between 1840 and 1850, however, most of these laws were either repealed or not enforced as a result of the cry that restrictions against unlicensed practitioners were designed only to create a monopoly.

State Supervision.—Careful attention needs to be given to the difference between a license and a degree, the one carrying with it the right to assume a title which is evidence of scholastic ability, the other the right to enter on the practice of a profession or a pursuit, both emanating from the same authority, the state, either directly or through intervening mediums. As foreigners are often puzzled to account for the diversity in our legislation, the fact is again emphasized that all matters of internal police control are left exclusively to the several states, and that national laws regulating professional practice can not be enacted. Hence the laws of the United States will be silent concerning licenses and degrees except in so far as they may apply to the District of Columbia and certain recent political dependencies.

Licensing.—The requirements for admission to practise a profession in the 54 political divisions of the United States vary as greatly in the various professions as the political divisions differ in area, extent, population and importance. However, two general items appear in full or in part in the various statutory requirements for licensing; namely, (1) the general preliminary education requirements; (2) the professional preparation. The general preliminary are given uniformly under the synopsis of requirements.

Supervision.—In medicine all political divisions except Alaska now have examining and licensing boards. In some States the stringent laws against non-medical practitioners are enforced; in others quackery receives such legal protection that any person may treat "the sick or suffering by mental or spiritual means without the use of any drug or material remedy." This is due largely to the fact that so many statutes lack specific definitions as to what constitutes the practice of medicine, and without these definitions the conviction of such practitioners can not be secured through the courts. There is much misunderstanding in this country regarding the duty of the state in relation to the health of the people. It does not consist in discriminating between schools or systems of medicine, but in requiring without prejudice or partiality of all who seek a license to practise

MEDICAL EDUCATION

for gain on the lives of fellow beings a minimum preliminary and professional training.

Medical Sects.—As commonly understood, regular physicians have no distinctive theory or practice; homœopaths treat diseases with drugs that excite in healthy persons symptoms similar to the morbid condition treated; eclectics make use of what they regard as specific remedies, chiefly botanic; physiomedicalists use only botanical remedies, discarding those which are poisonous. In practice these distinctions are not always observed. The following political divisions have mixed examining boards, that is, the boards are composed of representatives of the several schools of medicine: Alabama, Arizona, California, Colorado, Hawaii, Idaho, Illinois, Indian Territory, Indiana, Iowa, Kansas, Kentucky, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, Nevada, New Jersey, New Mexico, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Rhode Island, South Dakota, Tennessee, Texas, Utah, Virginia, Washington, West Virginia, Wisconsin, Wyoming.

Philippines and Porto Rico have examining boards, the former of three appointed by the commissioner of public health, the latter of five appointed by the governor.

The following have separate examining boards for each recognized school of medicine: Arkansas, Connecticut, Delaware, District of Columbia, Florida, Georgia, Louisiana, Maryland, New Hampshire, New York, Pennsylvania, South Carolina, Texas, Vermont. Alaska has no examining board. Section 460 of "an act to define and punish crimes in the district of Alaska" amended June 1900 provides that physicians, itinerant, must first apply for and obtain license from a district court or a subdivision thereof and pay for the license \$50 per annum.

Osteopathy.—"Discovered" in 1874, osteopathy (q.v.) is based on the theory that "a natural flow of blood is health" and that the bones may be "used as levers to relieve pressure on nerves, veins, and arteries." Osteopathy is now recognized by law in Arkansas, California, Connecticut, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Montana, Nebraska, New Mexico, North Carolina, North and South Dakota, Ohio, Oklahoma, Tennessee, Vermont, Wisconsin. Practice of "the system, method, or science of osteopathy" is restricted to licensed physicians and to graduates of "a legally chartered and regularly conducted school of osteopathy." The use of drugs and operations in "major or operative surgery" is not permitted in the practice of osteopathy.

Midwifery.—Special tests for certificates of registration as midwives are required in Connecticut, District of Columbia, Illinois, Indiana, Iowa, Louisiana, Minnesota, Mississippi, Missouri, New Jersey, Ohio, Philippines, Porto Rico, Texas, Utah, Wyoming. In the following political divisions the provisions of the medical practice acts do not apply to women engaged in the practice of midwifery: Alabama, Arkansas, Florida, Georgia, Idaho, Kentucky, Maine, Maryland, Michigan, Mississippi, Montana, New Mexico, North Carolina, Rhode Island, South Carolina, Tennessee, Vermont, Virginia, Washington, West Virginia. In other political divisions, though there are some special provisions for certain localities, the general

acts regulating the practice of medicine make no reference whatever to the practice of midwifery by women. It would seem, therefore, that these laws restrict the practice of midwifery to licensed physicians. Practically the conditions in political divisions where the laws seem to restrict the practice of midwifery to licensed physicians are little better than in political divisions where the practice of midwifery by women without a license is authorized by statute. There will probably be little change for the better till the midwife receives legal recognition, and the practice of midwifery is regulated by definite statutory provisions.

The following States have reciprocity clauses in the law, but they are operative in few cases only, namely: California, Connecticut, Delaware, District of Columbia, Indiana, Kansas, Maine, Maryland, Michigan, Nebraska, New Hampshire, New Jersey, New Mexico, New York, Ohio, Oregon, Pennsylvania, South Dakota, Texas, Vermont, Wisconsin.

Synopsis of Requirements, Jan. 1, 1904.—In the following political divisions medical diplomas do not now confer the right to practise medicine, an examination being required in all cases: Alabama, Arizona, Arkansas, California, Connecticut, Delaware, District of Columbia, Florida, Georgia, Hawaii, Idaho, Illinois, Indiana (after 1 Jan. 1905), Indian Territory (Cherokee and Choctaw nations), Iowa, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, New Hampshire, New Jersey, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Philippines, Porto Rico, Rhode Island, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, West Virginia, Wisconsin. The following require for admission to the licensing examination:

Alabama, requirements of State Medical Association.
Arizona, diploma from lawfully organized medical school.

California, diploma from legally chartered school requiring in no particular less than the Association of American Medical Colleges.

Connecticut, diploma from legally incorporated medical school.

Delaware, competent common school education, diploma from legally incorporated medical school.

District of Columbia, diploma of school authorized by law to confer M.D. degree.

Florida, diploma from recognized medical school.

Georgia, diploma from legally organized medical school.

Idaho, diploma from legally chartered medical school.

Illinois, four years of high school work, diploma from approved medical school.

Indiana, diploma from reputable medical school.

Indian Territory, Cherokee nation, diploma from reputable medical school; Choctaw, one term's attendance at reputable medical school.

Iowa, less than one year of high school work, diploma from recognized medical school.

Louisiana, fair primary education, diploma of recognized medical school.

Maine, diploma of reputable medical school maintaining an approved standard of preliminary education and medical instruction.

Maryland, common school education, diploma from legally incorporated medical school, as defined by A. M. C. A. or A. I. H.

Michigan, four year high school course or its equivalent, diploma from approved medical school.

Minnesota, four full courses of lectures at recognized medical school.

Montana, diploma from legally chartered medical school.

Nebraska, diploma from legally chartered medical school.

New Hampshire, full high school course or its

MEDICAL ELECTRICITY—MEDICAL JURISPRUDENCE

equivalent, diploma from regularly organized medical school.

New Jersey, four year high school course or its equivalent, diploma from legally incorporated medical school.

New York, four year high school course or its equivalent, diploma from a registered medical school.

North Carolina, diploma from medical school in good standing.

North Dakota, three six month lecture courses.

Ohio, full high school course or its equivalent, diploma from legally chartered medical institution.

Oklahoma, diploma from a reputable medical school, or proof of ten years' practice.

Pennsylvania, common school education, diploma from legally chartered medical school.

Philippines, diploma from reputable school recognized by the Board of Health.

Porto Rico, diploma from an approved legally organized medical school.

South Dakota, diploma from a legally organized reputable medical school.

Utah, diploma from chartered medical school in good standing.

Vermont, high school course or equivalent and diploma from a United States medical school.

Virginia, evidence of a preliminary education, diploma from a chartered medical school.

Washington, diploma from authorized medical school having at least a three year graded course.

Wisconsin, elementary education equivalent to admission to junior year of accredited high school, diploma from reputable medical college.

The following require the licensing examination only: Arkansas, Hawaii, Massachusetts, Mississippi, Missouri, Oregon, Rhode Island, Tennessee, Texas, West Virginia.

The following require approval of medical diploma by duly qualified boards: Kentucky, New Mexico, South Dakota; diploma must evidence four full courses.

The following require either approval of medical diploma or examination by State or other duly qualified boards: Colorado, Indian Territory (Creek Nation), Kansas, Nevada, South Carolina, Wyoming.

The following, requiring either approval of medical diploma or examination, admit to examination on: Kansas, four periods of study of six months each; Nevada, five years practice in the State just prior to act or diploma from a reputable school without the United States; South Carolina (Regular board), diploma from any medical school.

Registration of Nurses.—Laws of New York 1903, chapter 293, in effect 27 April, amended the Public Health Law and provided for the registration of nurses. Under the act any resident of the State over the age of 21 years and of good moral character, holding a diploma from a training school for nurses connected with a hospital or sanitarium, giving a course of at least two years and registered by the University of the State of New York as maintaining in this and other respects proper standards, may receive a certificate of qualification to practise as a registered nurse and assume the title or use the abbreviation R.N. Nothing in the act confers authority to practise medicine. The Regents may on the recommendation of the Board of Nurse Examiners provided by the law, waive the examination of residents of the State 21 years old, of good moral character, of those holding a diploma from a training school or having three years' experience, and may admit on a practical examination in nursing those actually engaged in the practice of nursing when the law took effect. The waiver will expire by limitation in three years from the date of enactment. New Jersey, laws of 1903, provides for the license of trained nurses by a county clerk. Porto Rico, in the codified school law 1903, provides for the establishing of three schools for the training of nurses and places the jurisdiction of the same under the commissioner of education and president of the superior board of health. Virginia, law of 1 May 1903, is quite similar to the New York statute except that instead of R.N. the ab-

breivation of the New York statute for registered nurses, the abbreviations T.N. or G.N. may be assumed by trained nurses or graduate nurses duly licensed by the board. (See **NURSE, TRAINED.**)

Medical Jurisprudence, the science of applying medical knowledge to the purposes of legal investigation; the application of the principles and practice of various branches of medicine in judicial proceedings requiring the explanation of doubtful questions, such as those relating to conception and birth, time and cause of death, physical and mental diseases, etc. Medical jurisprudence is often spoken of as forensic medicine, that is, the medicine of the forum. It embraces subjects both purely medical and purely legal, and covers a very wide range. These questions have usually been considered under five divisions: (1) Such as arise out of the relation of sex, including impotency, pregnancy, legitimacy, and rape; (2) injuries to persons, as wounds, death from violence, poisoning, and abortion; (3) disqualification by different forms of mental diseases; (4) feigned disability or disease; (5) questions as to age, identity, and life insurance. The major part of what is known as medical jurisprudence relates to evidence given in courts, even if the whole subject is not properly embraced within the subject of judicial evidence. As medical books can be used only in a very restricted sense in judicial proceedings, the testimony of medical experts has become very important. Our laws do not give recognized preference to any particular class or school of medical practitioners as qualified for expert witnesses. Knowledge is the test of qualification to give such evidence. The presiding judge passes, as a preliminary, upon the question of qualification, and determines whether the witness shall be permitted to testify. The opinion of a medical expert is never conclusive but is simply to be regarded by the judge or jury in the same manner as other evidence given to assist in establishing a fact. The medical expert is frequently called upon to state facts, as well as to give his opinion based upon facts shown by other testimony to exist. He may testify as to the health of a patient whom he has treated, of his habits and mental traits. He may testify that he found poison in the stomach of a person found dead, and give an opinion as to whether the poison caused death. He may give an opinion as to how long a person has been dead, from the condition of the body when found; whether a certain wound would produce death; and his opinion as to the instrument used to inflict the wound.

In all of these subjects of investigation the evidence of a medical expert is almost indispensable. In matters of life insurance, where the insured dies shortly after a policy has been issued to him, medical expert examination and evidence are often of great importance, bearing upon the condition of the insured at the time of insurance, and upon the question of

MEDICI—MEDICINE

representations. In suits for injuries to persons through the fault of others the question of the extent and probable continuance of disability are to be investigated with the aid of expert evidence. Many questions of supposed crime could not be properly determined without the knowledge and skill of the physician, applied as science directs. In cases involving sanity and mental capacity medical jurisprudence reaches the zenith of its importance. The untrained non-scientific mind cannot measure the status and capacity of other minds. If it is difficult, sometimes nearly impossible, for the best informed to determine accurately the physical condition of a person, none but those eminent for knowledge of and experience in matters of the mind ought to judge of its condition and hazard opinions as to its peculiarities and capacity. Insanity is a disease of the mind which assumes many forms—almost as many as there are different phases in the human mind. Many definitions are given of insanity, one of which is that it is a physical disease located in the brain, which deranges the mental and moral faculties to a greater or less degree. This definition is not quoted in preference to any other for the purpose of approval, but because it differs so radically from others, and to show the difficulty of comprehending the nature of this dread malady. The general term insanity comprehends all shades of mental diseases, from the slightest abnormal condition to that of the wildest maniac. The expert alienist is called upon to testify as to a person's ability to make a will, a contract, or to transact any kind of business. He is asked to decide whether a person is bereft of his normal reason to the extent that prudence requires his confinement; and when he has been confined, whether it would be safe or prudent to let him have his liberty. The questions upon which the expert's opinion with regard to the insane, or those supposed to be insane, are asked can hardly be enumerated. The importance of the subject cannot be overestimated, and new and earnest efforts are being constantly exerted by the medical profession to render its information upon this difficult subject as full and complete as possible. Many works upon medical jurisprudence have been published, and in all of them insanity, in its various forms, has had a prominent place, while quite a number of authors have produced commendable works devoted entirely to the subject of the medical jurisprudence of insanity.

Medici, mēd'ē-chē or mā'dē-chē, a Florentine family who rose to wealth through commerce, became prominent in the affairs of the state, gained supreme power, and were in general known as patrons of literature and art. GIOVANNI (1360-1429) rendered important service to Florence, and became gonfalonier in 1421. His son COSMO, the Elder (1389-1464), was called "Pater Patriæ," gained vast wealth, was a munificent patron of art and letters, and combined statecraft with commercial enterprise. He was for 34 years the sole arbitrator of the republic and the adviser of the sovereign houses of Italy. His grandson, LORENZO THE MAGNIFICENT (1449-92) governed the state in conjunction with his brother GIULIANO (1453-78) till the latter was assassinated by the Pazzi, a rival Florentine family. Escaping from this massacre he conducted a war with Ferdinand of

Naples, with whom he signed a definitive peace in 1480. The rest of Lorenzo's reign was passed in peace and in those acts of profuse liberality and magnificent patronage of arts and sciences, in which he rivaled or excelled his grandfather. He left three sons—PIERO (1471-1503), GIOVANNI (afterward Pope Leo X.), and GIULIANO, duke of Nemours. Piero succeeded his father, but was deprived of his estates when the French invaded Italy in 1494. He finished his career in the service of France. His eldest son Lorenzo came to power by the abdication of his uncle Giuliano, who became Duke of Urbino. He died in 1519, leaving a daughter, the famous Catherine de' Medici (q.v.), queen of France. After several reverses in the family, Alessandro, an illegitimate son of the last-named Lorenzo, was restored to Florence by the troops of Charles V., and by an imperial decree was declared head of the republic, and afterward Duke of Florence. The next name of importance in the family is that of COSMO "the Great" (1519-74), in 1537 proclaimed Duke of Florence and afterward Grand-duke of Tuscany. A learned man himself, he was a great patron of learning and art, a collector of paintings and antiquities. FRANCISCO MARIA I., his son, obtained from the Emperor Maximilian II., whose daughter Joanna he had married, the confirmation of his title of grand-duke in 1575, which continued in his family until it became extinct in 1737 on the death of Giovanni Gasto, who was succeeded by Francis, duke of Lorraine. MARIE DE MÉDICIS (q.v.) (1573-1642), queen of France, was daughter of Francisco I.

Medicine, History of. Within the past three centuries the average working life of English-speaking men has doubled. A few lived as long as now, and some strong or favored ones had efficient working powers as long; but the common life was worn out in what is now middle age. In Shakespeare's time the 50's were venerable: "Old John of Gaunt, time-honored Lancaster," was 58 when supposedly so addressed; and Admiral Coligny, murdered at 53, is described by his contemporary biographer as a very old man. Now, when we hear of a death in the 60's, we instinctively feel it an untimely cutting off, in what should be still fresh and vigorous age, and even at 80 it seems but just fair ripeness for the sickle. The three factors which have wrought this change are advanced physical comfort, medicine and its handmaid hygiene, and surgery. And in the mitigation of the frightful mass of actual pain, of physical torment which has racked every age down to the present, and which has scarcely even been alleviated till the past century, medicine stands incomparably first.

Some good foundations had been laid, it is true, in the century previous, and men were at work in the true scientific spirit. Great masters had stimulated their successors to study in the essential preliminary subjects, the constitution and functions of the body. The mighty Boerhaave of Holland (1668-1738) had revolutionized clinical observation; Morgagni of Italy (1682-1771) had "introduced anatomical thinking into medicine" (Virchow), and had done something the same service for pathology which Haller of Germany (1708-77) did a generation later for physiology; while John Hunter (1728-

MEDICINE

93) had not only introduced capital improvements into operative surgery, but had set the pace in research into anatomical and physiological problems. But the influence of old theories, founded on guesses and imperfectly interpreted observation, still lay heavy on the body of practitioners. The chief general theories in the 18th century were those of William Cullen (1710-90) and his pupil and assistant John Brown (1736-88) of the University of Edinburgh: the former—a great advance on the older theory of “humors,” and on the right track—made the nervous system the seat of diseases; the latter divided all diseases into two classes,—the sthenic resulting from over-excitation and treated by depletion, and the asthenic resulting from under-excitation and treated by stimulation. On the Continent, Hahnemann (1755-1843), his great theory propounded at Leipzig (1796-1810) soon after took adverse ground in his “homœopathy,”—a very different thing from what later passed under the name, though the latter retained the underlying basis. Besides his “law of similars” which Hippocrates had formulated before him, he rejected theory utterly, declaring that it was impossible to know anything about pathological changes out of sight; that we can only know symptoms, and if those are removed it indicates of necessity that the disease which produced them must be gone also. He also alleged that the fact of a given dose causing certain symptoms in a healthy person was obvious proof that it must be too large for a sick one; further, that to possess healing power the dose must be too small for recognition by the senses or chemical analysis; and that trituration, or dilution and shaking, of minute doses caused molecular changes which infinitely increased their power—“dynamization,” he termed it. The exaggeration of symptomatics and empirics was a reaction against the current reliance on unbiased theories; the paradox of infinitesimal doses, against the monstrous boluses and draughts with which patients were often gravely injured: there was usefulness in both reactions, but he went so far as to declare that a child could be cured while asleep by holding the pellets near it.

But the reign both of guesswork theorizing and of groping empirics, as exclusive methods, was coming to an end, and the first great blow was delivered in the first year of the century. France now came to the front where other countries had thronged. Bichat, a genius who wore himself out at 31 as did Clifford at 34, published the year before his death (1801) a work on general anatomy, in which he remade the entire science by showing that the different organs have membranes and tissues in common, and therefore that the seat of disease was in the constituent tissues and not in the organs as such. This not only simplified anatomy and physiology in much the same way that the alphabet simplified hieroglyphics, but threw the investigation of pathological changes into an entirely new channel. Parallel with this work, the followers in the footsteps of Morgagni were carrying on his work in studying morbid anatomy, the appearances of diseased organs; this too was remodeled on Bichat's discoveries. In 1808 and 1816 Broussais of Paris (1772-1838) published valuable works whose theory is merely

the sthenic and asthenic idea of Brown, but which led to renewed research in pathological anatomy and local ailments. Percussion had been devised by Auenbrugger of Vienna (1772-1809) in 1761, and Corvisart of Paris (1755-1821) revived it; but a greater effect was created by the introduction of auscultation 1816-19 by the Breton Laennec (1781-1826) at Paris, where he was Corvisart's pupil. He invented the stethoscope to diagnose diseases of the lungs, heart, and abdominal organs, by means of alteration in the normal sounds of their action; and his own use of it, and observations on the diseases of these organs, were the greatest advance made in clinics since Boerhaave, and may be said to have founded modern clinical science. In 1827, Richard Bright at London (1789-1858) first published his recognition of the true nature of the kidney disease since called by his name, and of the general characteristics of renal complaints, the foundation of our knowledge of them.

A special branch of investigation and analysis in the first half of the century was in discriminating the continued fevers; one of the most active and anxious battle-grounds for practitioners and theorists since modern medicine took its rise; though eruptive and malarial fevers were well differentiated. The first to be discriminated was typhoid, by Louis of Paris (1787-1872). His American pupils, W. W. Gerhard (1809-72) and Alfred Stillé (1803), with C. W. Pennock (1799-1867), all of Philadelphia, and George B. Shattuck of Boston, proved that typhoid and typhus, theretofore loosely classed together, were independent diseases, though generated by similar causes. This was confirmed by the work of A. P. Stewart at Glasgow and Sir William Jenner at London. Dengue or break-bone fever, yellow and relapsing fevers, and their kind, were carefully studied. Among the other names associated with this labor are R. J. Graves (1797-1853) and William Stokes (1804-78) of Dublin, George Budd (1808-82) of London, and Daniel Drake (1785-1852), S. H. Dickson (1798-1872), and Austin Flint (1812-86) in America. This work was soundly based by 1860 in regard to fever clinics.

Development in the United States.—When the 19th century opened there were only three medical schools in the United States, and only two of importance,—those connected with Harvard College and the University of Pennsylvania,—and only two general hospitals. Medical education was somewhat on a footing with divinity education: physicians took apprentices for some years, and clergymen took private pupils in divinity. Those who wished and could afford a more systematic medical education went to London or Edinburgh. The literature of the profession was English and (translated) French almost wholly; Rush and a few others had published books, but not of moment, and there were only two or three medical journals. There were but two medical libraries except in private hands, those at the New York and the Pennsylvania Hospitals. The physicians of most reputation were Benjamin Rush and Philip S. Physick of Philadelphia, David Hosack and Samuel L. Mitchell of New York, and James Jackson and John C. Warren of Boston. The smaller places did not lack for able men, though of less wide-

MEDICINE

spread repute: such as Daniel Drake of Cincinnati, and Nathan Smith, founder of the medical schools both of Dartmouth and of Yale. But the great repute of the French medical investigators in the first quarter of the century—Bichat, Corvisart, Laennec, Louis, etc.—took an increasing number of American students there, and the new spirit they brought back revolutionized American practice for a time. The enormous increase in American population, however, enlarged the demand upon its stock of medical knowledge far faster than that could be legitimately developed: educated physicians could not be turned out so fast as the thronging populace needed them, and it was the golden age of the half-educated. Perhaps, too, the masses had the same ideas of the needlessness of training in medicine as in public life. The machinery was multiplied indefinitely, and the product turned out depreciated in proportion. Up to about 1870 the medical schools sprung up everywhere, both public and private, and their competition for pupils degraded the standard very low indeed. Diplomas were given for two years' work, and short sessions at that; and the instructors were sometimes as incapable of giving competent education as the authorities were unwilling to enforce severe study or careful experiment. The first place to exact a new and much higher standard was Harvard, about 1870. The rapidity with which the rest of the country, in the better institutions, followed its lead, showed that there was a large instructed upper class which appreciated the need of thorough education in this as in other departments of knowledge, and understood that medicine was a great science as well as a delicate craft. As always, the rich were glad to give when they knew where to give intelligently, and endowed generously both study laboratories and general and special hospitals. It would be a grateful task to enumerate these, did space permit: here can be mentioned only such names as Pierpont Morgan and Andrew Carnegie, Johns Hopkins and Vanderbilt, Sims, Strathcona, Mount-Stephen, Payne, and Lane.

Methods of Investigation.—The last century of course did not invent experiment in medicine or physiology: the method was recognized by the great Greek and Latin physicians, used by the two great Bacons, Roger and Francis, fully developed by Harvey, and utilized with superb skill by Hunter. But though these great men did not lack sound ideas, they lacked tools and the mass of laboratory facilities gradually built up in our age. The research laboratory is the development of the 19th century, and well along toward the middle of it. The workers in it experiment along three main lines,—the condition and functions of the organs in a state of health; the nature of the functional changes produced by disease, and the causes of the changes; and the prophylactic or curative agencies which can neutralize the disturbing agents. The results of these studies have created a new knowledge, which is to that of even 1800 like the relation of an adult to a baby. The physiological and pathological revelations have not merely left the knowledge accumulated in the previous centuries possessed of a merely archæological interest, but they have weaned us from the sway of any authority whatever; recognizing

that even the seemingly soundest conclusions of the present are but working hypotheses, which may have to be abandoned at any time on fresh evidence,—the true scientific spirit. No part of life has been left as it was, the digestive and assimilative, circulatory, respiratory, and excretory, reproductive and directive functions have all been illuminated by a flood of light. Especially has this been wonderful in the study of the brain, whose functions not only are so intangible and elusive, but apparently so impossible of experimentation without destroying the subject of experiment. Not only have we penetrated deep into the secrets of the paths and operations of sensory and motor impulses, the localization of functions, and the mechanical implements of thought and memory, but we have been enabled to apply with great success a number of curative measures not before dreamed of, or even if so, not deemed possible of use.

Another marked feature of the age is the development of specialism, in which we have to set off a lack of co-ordination and breadth of knowledge or judgment against an extension of knowledge not possible by any other method. Scientifically, no other means has been so potent in extending and deepening the realm of demonstrated fact. Practically, no other has been so effective in developing curative processes. This specialism must not be confounded with that of the "lung doctors" and "fever doctors" of former days, mere guesswork empiricism of uneducated practitioners; it rests on a basis of competent general medical knowledge and thorough education in the specialty besides. The physicians who give their time and thought to one limited field—diseases of women, of children, of eyes and ears, of throat, of teeth, of the brain, or who, though less exclusively, choose diseases of the heart or the liver or other organs for their preferred field—have won for the profession some of its most signal triumphs. American physicians especially have stood at the very head of those who have perfected dentistry and ophthalmology, as well as gynecology or diseases of women. In this branch the blessings they have conferred not only on women in ordinary disease, but on both them, their male relatives, and their children, by the saving of life and health, in the special crises of the sex, cannot be estimated.

One of the finest branches of this specializing is that of alienism: and the change in the mental attitude of the public toward it in consequence of that study has been most remarkable and gratifying. From a matter of derision, as it was largely in the Middle Ages, or ineffectual commiseration as an act of God, or mere terror and aversion, it has come to be sympathetically studied, often relieved, and always recognized as a mere functional disease. Starting from the labors of our own Rush, of the English Tuke, of the German Jacobi and Hasse, and the French Pinel and Esquirol, this reform has built up a body of physicians in every civilized country not only to study mental aberration scientifically, but to introduce humane and rational methods into its care and cure. America is not behind any other in the treatment of the insane; but the curse of so many good causes in America—politics—is a blight upon this science still in too many States.

MEDICINE

Prophylactics.—"Prevention is better than cure" has reached its most brilliant exemplification in the 19th century. It is true that nations far back in antiquity have grasped some of the chief conditions under which diseases most prevail, and have even carried systems of public hygiene much farther than even yet we have re-attained to. The law of Moses furnishes a remarkable example, in its insistence on cleanliness, isolation, and diet; the Greeks systematized diet and exercise and general physical training thoroughly, their ideal being "the fair mind in the fair body" (and had discovered that professional athletes do not make good soldiers, from lack of endurance); the Romans and Greeks made the bath almost a fetish, far beyond even the English, and the public benefactor of the day gave his city baths, not libraries. But modern science goes much farther: it discerns the causes which create the disease itself, and removes or neutralizes them. In the 18th century some light had been thrown on this: Howard had seen that typhus was in direct ratio to the crowded condition of jails, Captain Cook and Sir Gilbert Blaine had perceived and removed the conditions that generate scurvy. Jenner had gone still farther and anticipated the methods of modern preventive medicine by vaccination. But all these could only be feeble and groping attempts until there was a scientific basis for them. This was furnished by bacteriology, and a few words upon that are needed to make later explanations intelligible.

The Bacteriological Basis of Preventive Medicine.—The ancients speculated with great eagerness and sometimes acuteness on the origin of life, and had guessed that disease and living germs were in some way related; and the relation of disease and putrefaction was not doubted. As soon as the first weak crude microscope was invented, it was used to investigate the organisms of decay. The Jesuit Kircher in 1671 examined the "minute worms" in putrid milk and cheese and meat; in 1675 a Dutch merchant named Leeuwenhoek improved his lenses and studied the "animalcula" in rainwater, saliva intestinal fluids, and putrid substances; and the physicians of his day were quick to suspect and suggest that these organisms might be the cause of all diseases. In 1762 the Viennese Pleincz, who had studied fluids in all conditions, gave his firm adhesion to this belief. But this was not the whole; whence came these organisms—were they self-generated, or simply transmitted from other bodies and multiplied? Despite even the microscope, the theory of spontaneous generation maintained itself tenaciously far past the middle of the century. A distinguished chemist maintained as the result of careful experiment that germs were so generated, and even the proof that the organisms were forms already existent did not convince him or his followers. It was reserved for Pasteur in 1861, and finally (with Koch and Cohn) in 1876, to crush this theory forever. Following quickly on the first came the discovery of the anthrax germ by Pollender and Davaine in 1863; shortly afterward Lister's epoch-making researches into wound infection, making possible the triumphs of antiseptic surgery; then swiftly followed the isolation of the germs of relapsing fever, leprosy,

and typhoid. But towering above all, from the enormous difficulties overcome, were Robert Koch's isolations of the tuberculosis germ in 1882, and of that of Asiatic cholera in 1884. Thence on, a crowd of discoveries of the germs of other diseases have left but few—unfortunately, some of the worst—unrevealed, diseases of animals and insects having been investigated as well as those of men.

Thus much for the history of discovery: but what are these germs? The popular mind is very confused on the subject. Bacteria are generally thought of as a sort of worm. In fact, they are not members of the animal but the vegetable kingdom; the smallest organisms known. They are protoplasm, a jelly-like substance, enclosed in a hard membrane exactly like wood fibre. They are classified by shape in three groups: cocci (spherical), bacilli (rod-like), and spirilla (corkscrew or undulatory shape). The cocci are found in pairs, fours, clusters, or chains; they include the smallest known organisms, some of them being as small as $1/150,000$ of an inch in diameter. The bacilli are larger, but vary much: from $1/25,000$ to $1/4,000$ of an inch in length, and $1/125,000$ to $1/16,000$ in diameter; some of them have organs of locomotion, called *flagella*. The spirilla are longest of all, sometimes $1/600$ of an inch. They all increase either by fission into two, or by developing a spore or seed. Their rate of multiplication does not seem rapid, but that is because we forget our old arithmetical "catches." A bacterium dividing each hour, and each division thus dividing, would obviously have increased to 8,388,608 in 24 hours; and in three days to a number beyond all verbal expression, weighing nearly 7,500 tons. Of course this is a *reductio ad absurdum*, as the body they feed on would be exhausted early in the series; but outside of starvation, nature has other ways of arresting their multiplication.

Before discussing this point, let us look at the nature of bacteria as a whole. It is a misapprehension to think of them simply as a principle of disease and death. They are a universal principle of life as well, and the few species which cause harm are lost in the myriads which do good. But for them, organic existence would perish; it has been suggested that the first organic things on earth were bacteria,—organisms needing only nitrogen for support,—and life means their multiplication. They abound in air and water, in the soil to nine feet deep or so, and in the outsides and insides of all organisms; but naturally their number varies with the conditions for sustaining existence, and there are none at extreme altitudes or in glacier ice, and few in the polar regions or the deep seas. Those conditions are (1) moisture, without which all die; (2) air, as to which there are three classes,—aerobes which must have it, anaerobes which must not have it, and facultative anaerobes which care nothing either way; (3) food, which must be living tissues for a few, may be dead ones for most, and can be mineral salts or atmospheric nitrogen for some; (4) temperature, which has for possibilities of their multiplication, though not of their life, extremes of 32 and 170° F.; for an average most favorable tract 60 to 104° ; and for disease germs (as evolution would imply) is most favorable

MEDICINE

98.4°, or blood heat; (5) light, of which direct sunlight is death to all, and common daylight, of no importance either way to most.

Their enormous number gives them a power of accomplishment seemingly almost miraculous, and certainly far superhuman. The quality of farm products and dairy products, of fatted stock or wool, of hides or horn, and many other familiar articles, is due to them; and they are the scavengers of our water supply from pollution, as well as some of them deriving powers for harm from it. Still more to our surprise, peas and beans certainly, and all plants probably, gain their life from the soil through the medium of bacteria which live in their roots, decompose nitrogenous minerals and feed on atmospheric nitrogen also, turning both kinds over to the plant for its nourishment.

Hence the processes of health and disease alike are functions of bacteria. What medical science has specially to do is to trace the progress and manifestations of that spread of harmful bacteria commonly called "infection," and the methods by which the system's natural tendency to starve or poison them can be reinforced. Before entering upon the phases of prevention and cure, we must indicate briefly how they obtain entrance, how they produce their effects, and what is the reaction of the body thereupon.

The first is naturally limited in variety: they enter by being injected from the bites of animals or insects, from wounds or abrasions, from inhaling infected air, from eating or drinking substances containing them. Specific cases will be considered later. The action of the microbes is by generating a set of poisons known as toxins, which produce either languor, loss of appetite, and vague general discomfort, or more active pains, headaches, fever, inflammations of the tissues, perhaps entire stupor. The action of the body is complex and difficult, and not thoroughly worked out; but some things are known. The normal blood and tissues have a germicidal power, varying in different bodies even of full health, and varying still more as to specific germs, each body having its own set of germs to which it is congenial or maleficent. The struggle of the body against their multiplication, dependent on this unfavorableness of soil for their propagation, is called "general resistance," and on its strength depends the immunity against ordinary disease; and the secret of inoculation is, that if the soil favorable to the propagation of a specific bacterium is eaten up, it is usually very slow in fresh growth. The disease microbe gains no lodgment because there is nothing to live on. But in addition to this passive resistance, an active one is carried on by the white cells or "leucocytes,"—the wandering cells, and those of the tissues chiefly invaded, as well as those of the spleen and lymphatic glands; these and others seem to work among the toxins and produce a change in their chemical constitution, at last elaborating counterpoisons or *antitoxins* which neutralize the first, and enable the cells to carry on the war against the disease microbes till one or other is overcome; and as said, if there is recovery, a partial or complete immunity is afforded against further ravages of the same class of microbe.

But it is evident that if this process can be shortened and made more certain, so that the antitoxins can perform their work before the

disease microbes arrive at all, a great system of prophylactic or preventive medication can be had; and if the antitoxins are used in a case of similar disease, they will strengthen the natural power of the body to develop them, and greatly aid it in throwing off the disease. This is the new system of serum-therapy, begun by Pasteur in 1877, and continued by a set of brilliant experimenters since. The serum of the infected blood is chosen as a medium for injection into the blood of the patient. Pasteur with fowl cholera, Raynaud with cow-pox, Salmon and Smith in this country in 1886 with hog cholera, fully proved the possibility of the treatment, curing animals previously inoculated with the most virulent disease poisons, and rendering healthy animals immune; but these excited but languid interest till Behring's announcement in 1892 of a diphtheria antitoxin, with incontestable proof of its value. Oddly, not only laymen but physicians in many cases opposed it; partly from misunderstanding, partly from humanitarianism as involving experiments on animals. Most of its opponents have now been won over, from the crushing weight of evidence, and the brilliant work of its supporters. Diphtheria alone has reduced its mortality one half since the introduction of the serum treatment little more than a decade ago.

To illustrate the general methods of preparing all the serums for infectious diseases, that of diphtheria will serve as a model. The bacilli are cultivated for eight or ten days in alkaline beef broth, found to develop a peculiarly virulent poison under its work; the toxin is then isolated and its strength precisely estimated, then set aside in sterilized vessels. A healthy horse, found by experiment the most suitable animal, has injected under the skin of its neck or fore-quarters 20 cubic cm. of toxin and perhaps half that of antitoxin, three times five days apart; then it is given heavier and heavier doses of toxin alone, a week apart, till it can endure doses speedily fatal at the outset. After two months it is bled and its serum tested; if satisfactory, it is dosed as before for another month, when the maximum quality of serum is usually reached. The animal is then bled sufficiently, the blood being caught in a sterilized vessel and placed in a refrigerator. The coagulation finished, the serum is drawn off from the clot and its strength accurately determined in the laboratory, an antiseptic is added to keep it, and it is bottled for use. Antitoxins for tetanus and snake bite have been similarly prepared, and the present century will see probably every infectious disease and every venom with its bacterial antidote.

Specific Results of Preventive Treatment.—

An abstract of the work already done in preventive medicine can best be given by a note of the great maladies of men and animals more or less controlled by it, with their bacteria. But it must be noted that of the ones cited, the bacteria of smallpox and hydrophobia (though the former has been almost exterminated by vaccination), as well as scarlet fever and measles, have not yet been isolated. The reason may be excessively small size, since that of cattle pleuropneumonia is barely visible under the microscope; or it may be that the organisms are not bacteria but unknown beings.

MEDICINE

The diseases may be classified variously, and some admit no special classification, but we will begin with the great scourges which have desolated the world in the past, and which have owed their virulence and destructiveness, though not their direct origin, to filth and overcrowding and general unsanitary conditions.

(1) The Great Plague, or Bubonic Plague. The frightful devastations of this in the past need not be recited; it will be remembered that it was the "Black Death," which swept off from a third to a half the population of Europe in the latter part of the 13th century. Long thought almost extinct, it reappeared with fearful intensity at Hong-Kong in 1894, spread to India and had several occasions of violent outbreak, raged in Turkey and on some parts of the Mediterranean coast, and in small volume has shown itself in Glasgow, South American ports, New York, and San Francisco. But in western Europe and America it has been easily put down, and serum inoculation has been fairly successful in India. Its bacillus is known to enter the body by wounds of the skin, and very largely by bites of fleas from infected rats.

(2) Asiatic Cholera. This terrible plague even in the middle of the 19th century swept away thousands of lives in America; now it has been so thoroughly controlled that it is not feared even to the extent of disturbing commerce when it appears. It originated on the banks of the Ganges in India, where Koch found its spirillum and the means of its spread,—almost entirely through drinking infected water, though very slightly by contact,—so little that since 1873 the disease in Great Britain and the United States has never got farther than the port of entry. How thoroughly a city's immunity depends on its water supply is strikingly shown by the twin city on the Elbe in 1892; Hamburg, using the unfiltered river water, had about 18,000 cases and 8,000 deaths; Altona, with a filtration plant, had 516 cases, largely refugees from Hamburg.

(3) Typhus Fever. It is hard to believe that this was once so steady and frightful a curse in the West that one investigator says its history would be that of Europe. In all the large cities, in camps and ships, hospitals and jails, it was almost permanent, and its rate of mortality appalling. It depended so entirely on filth and overcrowding that mere city sanitation and cessation of packing, sewers and a good water supply, have practically exterminated it except in a few slums. The rate has been reduced in England from 1,228 per 1,000,000 in 1838 (typhus and typhoid together, not then discriminated) to 137 typhoid and 3 typhus.

(4) Typhoid Fever. This disease, long identified with typhus, is now not only known to be separate, but dependent on somewhat different generating conditions. It depends not so much on dirt and crowding as on sewer gases and contaminated water and milk. Given pure water and perfect drainage, a city practically has no typhoid,—except when its milk supply is drawn from infected sources, as often happens; while seaside resorts are notorious generators of the disease, from the sand-driven wells and the crowded privies draining into them. The germ was discovered by Eberth in 1880, and called *bacillus typhosus*. The continued prevalence of

the disease in our cities is due partly to the great hardiness of the bacillus, which can exist in the body of a patient long after recovery, and be a means of contamination. The outbreak in the Spanish-American war seemed due to overcrowding, but more likely to the contaminations caused by it, as in the seaside cases. In the country districts there is no mystery about it: often there is no rural sanitation, and even the wells are grossly neglected, sometimes on a slope below a barn. In the typical example at Plymouth, Pa. (about 8,000 people), the evacuations of a typhoid patient were thrown out during the winter on the banks of a stream which fed the town reservoir; the spring thaw carried them into it, and the town had a typhoid epidemic which struck down 1,200 people. The proper precautions are the use of boiled water, and of distilled-water ice, the thorough inspection of dairy surroundings and water sources, and great care on the part of physicians and nurses to disinfect discharges, are the true prophylactics.

(5) Diphtheria. This bacillus was discovered in 1883-4 by Klebs and Loeffler, and has been given their joint names; it enters either by inhalation or the stomach. The antitoxins thus made possible of preparation have reduced the mortality one half; the hygienic precautions have greatly reduced the primary prevalence. The latter are isolation and disinfection, watchfulness during convalescence, careful examination of the least throat disorder, and—since the mild and often unsuspected cases where the children go about and to school freely are the worst in spreading the disease, because not guarded against—regular inspection of school children's throats. Children's teeth and mouths should also be carefully attended to, and the tonsils removed where tonsillitis is frequent.

(6) Yellow Fever. The germ of this has not yet been isolated. Its dependence on dirt, however, would seem almost as close as typhus, thorough sanitation having practically eradicated it in its favorite tropic home, Havana, and in the Southern cities once ravaged by it. Jamaica has been almost freed from it in the same way.

(7) Smallpox. This once widespread and sometimes destructive scourge, almost more dreaded for life than for death, has been so nearly eradicated by vaccination, and vaccination alone, that the persistence of a strong section of the community opposed to it is one of the strangest of phenomena. The evidence is overwhelming. Wherever smallpox breaks out, it is in an unvaccinated district, country, or body of people, and the fatalities are almost all among the unvaccinated and never among the re-vaccinated; where two bodies of men lie side by side under the same conditions, as the French and German armies in 1871, the vaccinated body scarcely suffers, the unvaccinated one is decimated; and in Egypt, where the natives are compulsorily vaccinated and the foreigners escape it, the fatalities are five foreigners to three natives, though the latter are far poorer, worse housed and fed and medically cared for, and would naturally be supposed the chief victims. If all the people of a country were vaccinated, and re-vaccinated at fair intervals, the disease would absolutely disappear, as it has in the German army: it is the ones who escape vaccination that

MEDICINE

maintain its existence. The ravages still among the unvaccinated French Canadians are a constant example of what it has been. For instance, on 1 April 1885 there was a smallpox death in the Montreal hospital, the Hôtel Dieu; the patients who had not had it were sent home; the disease spread like wildfire, and by the end of the year 3,164 persons died of it, the city's business for the winter was destroyed, and the loss was millions. It has been proved that not above one in 100 of the vaccinated takes the disease when exposed, and almost none die; of the unvaccinated, fully 99 per cent take it and 25 to 30 die. It must be remembered, however, that there cannot be perfect security without frequent re-vaccination, as the power of the cowpox varies with different persons and is rarely permanent, sometimes not over a year or two. With animal lymph there is no danger of the introduction of other diseases, the fear of which is made an excuse for refusal.

(8) Tuberculosis (including "consumption" of the lungs), called by Holmes the "white plague"; the most destructive single agency of death, and responsible for 120,000 deaths a year in the United States, more than all other infectious diseases together, except pneumonia. Formerly believed hereditary (the truth in a very slight degree), it is now known to be the product of a bacillus, isolated by Koch in 1880-2; and the hereditary conditions are mainly environment, with some tendency to anæmia. The communication, though in a few cases by infected milk, in the overwhelming mass proceeds by inhalation of the particles of dried sputum from other consumptives' lungs, blown about in the dust of streets or houses, or even wards of hospitals. Naturally, the greatest mortality is in places where free circulation of air is not possible, as jails and "institutions." Nature seems to have provided for the largest possible distribution of them: one patient not in extremes has been known to give off from two to four thousand millions of germs in 24 hours; they are shaken from handkerchiefs, from the beard or mustache, from the furniture and other things handled by consumptives, beaten up from contaminated floors. So universally diffused are they that it seems probable there are few persons who have not some tuberculous lesion of some organ, for it is not confined to the lungs. The great weapons against it are, first, maintaining the standard of nutrition and cleanliness as high as possible; with careful protection of the chest; second, the education of the public in the dangers of the dried sputa; third, enforcement of notification and registration of cases; fourth, public sanatoriums for treatment of early cases; fifth, special hospitals for incurables. Immense progress has already been made: the rate in Massachusetts, one of the chief seats of the disease, has fallen from 42 to under 21 per 1,000 since 1853; and in New York, Glasgow, and other great cities the drop has been similar.

(9) Pneumonia. Frankel in 1886 isolated this germ, a coccus growing in pairs and chains and entering by inhalation; and with one fifth of healthy persons, present in the saliva. This is almost the one disease which has not diminished under medical and hygienic science, and has apparently increased, ranking next to consumption in deadliness. It is especially a disease of languid circulation, as in the aged (their

typical disease) and invalid and the intemperate; but it lays low vast numbers of the strong as well. The treatment has been revolutionized from the bottom, but still from one fifth to one fourth of all attacks are fatal. Thus far the most valuable novelties have been measures to prevent sudden heart failure.

(10) Malaria. Till a generation ago, this was one of the obscurest diseases on our list; it still remains one of the worst drawbacks to civilization, preventing general Caucasian settlement in the tropics. It was known to have an intimate connection with wet ground, marshes or the building up and sewerage of new districts; to prevail chiefly in the fall, and be caught chiefly from dusk to dawn; and to be non-contagious. But nothing more was known till M. Charles Laveran, a French surgeon who had gone to Algeria specially to study the disease, discovered the germs in the red blood-corpuscles of patients: not bacteria, but small protoplasmic bodies which begin as transparent rings inside the corpuscle, feed and enlarge on its coloring matter and form blackish grains from it, and on attaining a certain size divide and redivide in vast multitude, giving off a toxin which causes the acute spasm of fever, and apparently of chill also. Each variety of the fever is caused by a special form of the parasite. It was suggested by Dr. Patrick Manson of London that the communicating agent might be mosquitoes, also products of wet ground and active after dusk; and an army surgeon of India, Ross, found that mosquitoes did transmit similar parasites between birds,—developing them in their stomach cells into filary bodies, which pass into the saliva and so through bites into the bodies of others. It is now thoroughly established that this is the chief means of transmission among human beings. The mosquito is not the common *Culex* of the northern United States, but chiefly the *Anopheles*, which develops and transfers the parasites as just described. The crucial experiments are, that these mosquitoes, allowed to bite malarial patients, and subsequently healthy persons in non-malarious regions, infect the latter, and that in the deadly *campagna* around Rome, two persons during the worst season, from 1 June to 1 Sept. 1900, lived entirely immune by simply keeping behind tight netting after dusk, while exposing themselves freely during the daytime. The net result is, that swamps and stagnant pools should be drained, that persons having malaria should be thoroughly treated with quinine so that they may not transmit the disease if bitten by mosquitoes, and that Europeans can live in the worst districts by not being out after dusk and by thoroughly wiring their houses.

(11) Venereal Diseases. These are in one respect by far the worst of all we have to mention; for they are the only ones transmitted in full virulence to innocent children, to fill their lives with suffering, and which involve equally innocent wives in the misery and shame. In the victim, the infection does not stop with the parts originally affected; and it has not been seriously checked, from the nature of its causes making it impossible for society to stamp out or much diminish the actions which involve it. Physicians and the public have each solemn duties in this matter: the former, to act as apostles of continence, especially with the bach-

MEDICINE

lors who pretend to believe that their health needs the indulgence and will not marry, and to use every effort to prevent the disease being carried to others; the latter to let no scruples of delicacy or affected ignorance stand in the way of thorough public supervision. The opposition to this is natural: women feel it adding an unfair stigma to an already shameful load of injustice; decent people feel that legal recognition is legal palliation and defense; and there is the real danger shown by experience, that if it is once shielded by the law, the weight of the police force will be thrown on the side of protecting instead of abating houses of ill-fame, as with liquor saloons but with far more disastrous results. But any risk is preferable to the present shocking conditions, which make city brothels a stream of contamination to what should be the purest of homes.

(12) Puerperal Fever. Remembering not merely the former fatality of this disease,—terribly frequent in private practice, and in maternity institutions rising from five even to ten per cent,—but the double bereavement it usually involves, the almost entire extermination of this disease is one of the grandest triumphs of modern medicine. Its contagiousness had long been suspected, when Oliver Wendell Holmes in 1843 published a full and clear statement of the facts leading to the belief; but for many years the profession generally scouted it, —a wit and poet could be no authority in medical science. Others gradually took his view; but it was the Lister antiseptic treatment which enabled it to be fully tested. Now the mortality is but about one third of one per cent.

(13) Hydrophobia. This disease, though widely distributed among animals, is not very common among human beings in America, but excites a widespread horror from the multitude of pets, any one of whom may chance to be stricken and to communicate it; in Europe it is less rare. The germ has not been isolated; but Pasteur ascertained its calculable effects on the nervous system, and that certain inoculations could render healthy animals immune and neutralize a powerful dose of the virus. He founded an institution in Paris for its treatment, and the mortality among those bitten by certainly rabid animals was reduced to less than one half of one per cent. In dogs, quarantine and muzzling are the only precautions.

(14) Leprosy. This is caused by a bacillus which probably enters the body through abrasions of the skin, and probably only from contact with another person; even so, it is but slightly contagious, contrary to the popular notion. It was discovered by Hansen in 1879, and since then an active and very hopeful investigation into prophylactic conditions has been carried on. Known to be old and widespread in Asia, it is not generally known that it came into San Francisco with the Chinese, that the Norwegians have given it a considerable foothold in the Northwest, and that in Louisiana there is an endemic condition of it, and slightly in some other Southern States. It exists in New Brunswick likewise. Still more important for the United States is its great abundance in Hawaii and the Philippines. It can be readily kept in check by segregation and inspection.

Some other bacilli may be mentioned, of which the discovery has not as yet been followed

by large results in prevention. The deadliest known is that of lockjaw or tetanus, discovered by Nicolaier in 1884; it enters by wounds, and in some tropic parts all lesions tend to develop tetanus as surely as other sections do gangrene. Influenza, or "the grip," has one of the smallest bacilli known; it is spread by dried nasal discharges, and enters by the nasal tracts. Anthrax is a disease mainly of cattle and sheep. Its bacilli were the first micro-organisms of disease to be isolated, and can enter either by inhalation, infected food, or abrasions.

Changes in Therapeutic Method.—It is only re-stating the same fact to say that new practice has followed on new theory, or rather new scientific knowledge of the nature of diseases. The only object of acquiring the knowledge was to embody it in practice. With the discovery of the zymotic principle in disease, traced finally to bacterial action, there could not be the same or like treatment as when the body was supposed to be possessed by conflicting "humors"; or when a fever was supposed to be an abnormal increase of vital fluids needing to be drained off; or when diseases were supposed to have no relation to any function of the body except the organs furnishing the dominant symptoms; or when one school supposed them waves of some sort, to be overborne by more powerful waves of the same class, and another school refused to entertain any theoretical suppositions at all, but relied on the history of cases, printed or traditional or experimental. But it may be said that the greatest revolution in the century, or at any rate the last half of it, is in the position assigned to drugs. At the outset, the old faith in bleeding still held great sway: Boerhaave himself had made almost the whole art of medicine consist in its proper application, and at the end of the 18th century Washington had been sacrificed to it. But by the middle of the century it began to diminish. Both the homœopathic and the regular schools based their practice, and many still base it, on the study and administration of drugs. They differed in the size and strength of doses, from huge boluses, or powders or draughts whose efficacy was supposed to be in proportion to their nauseousness, to small bland triturations or dilutions; but not in the assumption that in them lay the one efficient method of dealing with disease.

The advanced school of the present does not discard medicines; so far from it, it studies them with more care than ever, and values a few, well tried and certain of quality and action, as highly as ever. It knows the mass of current medicines to be inert or worse, uncertain of action and applied to human functions of still more uncertain action; but it seeks to study thoroughly and apply scientifically the few real medicines or healing agents which must be used,—quinine and digitalis, and opium, iron and mercury and iodide of potassium, etc.,—instead of a swarm of dubious and varying materials. It is significant that some of the stand-bys are extremely old; iodine, as ashes of burnt sponge, was known in classic times, and ergot impressed its peculiar action on stock-raisers' minds from very early ages; even Peruvian bark is nothing new. We have not as yet made as many additions to the stock of panaceas as we might. But chemistry has done vast services for us, and will probably do far more. Aside from the dis-

MEDICINE

covery of new substances like cocaine, it has given us the active principles, of calculable strength and purity, in place of crude drugs of varying strength at best, and of varying purity and age; and there is no reason why we may not have new specifics as sure (and for as important diseases) as quinine.

But the new school does not feel itself under obligation to give any medicines whatever, while a generation ago not only could few physicians have held their practice unless they did, but few would have thought it safe or scientific. Of course there are still many cases where the patient or the patient's friends must be humored by administering medicine or alleged medicine where it is not really needed, and indeed often where the buoyancy of mind which is the real curative agent can only be created by making him wait hopefully for the expected action of medicine; and some physicians still cannot unlearn their old training. But the change is great. The modern treatment of disease relies very greatly on the old so-called "natural" methods, diet and exercise, bathing and massage,—in other words, giving the natural forces the fullest scope by easy and thorough nutrition, increased flow of blood, and removal of obstructions to the excretory systems or the circulation in the tissues. One notable example is typhoid fever. At the outset of the 19th century it was treated with "remedies" of the extremest violence,—bleeding and blistering, vomiting and purging, and the administration of antimony and mercury and plenty of other heroic remedies. Now the patient is bathed and nursed and carefully tended, but rarely given medicine. This is the result partly of the remarkable experiments of the Paris and Vienna schools into the action of drugs, which have shaken the stoutest faiths; and partly of the constant and reproachful object-lesson of homœopathy. No regular physician would ever admit that the homœopathic preparations, "infinitesimals," could do any good as direct curative agents; and yet it was perfectly certain that homœopaths lost no more of their patients than others. There was but one conclusion to draw,—that most drugs had no effect whatever on the diseases for which they were administered.

These "natural methods" have been indicated above; but some further analysis of the individual elements is worth while. It will be noted that this is not, as a hasty reader might assume, the discarding of all the results of civilization and a return to barbarism. That the natural methods are efficient is precisely because scientific knowledge and modern improvements in appliances, as well as the thousand civilized devices for comfort and cleanliness, unattainable even a generation ago, have raised them to the level of first-rate therapeutic agents.

Perhaps foremost in the rank is the trained nurse, who is not only a greater agent of philanthropy than many professed altruists, but sets free the physician from a load of care and anxiety. In place of ignorant and stubborn, usually conceited and often superstitious women, who pride themselves on defying all the doctor's commands, these intelligent and loyal women can be relied on to carry out all his injunctions, to watch carefully for indications of danger, and to furnish notes enabling him to view the progress and hourly changes of a critical case.

The importance of diet in therapy, and indeed in the preservation of health before the system becomes a subject for the physician, has never been wholly lost sight of; but at no time has it been so thoroughly recognized, so firmly insisted on, raised to so high a place in therapeutic agencies. Too much food, improper or ill-prepared food, over-haste in eating, all have their part in the dyspepsia which is a byword among foreigners as the national malady, and though much lessened, is still most formidable. Over-eating, too, is largely responsible for the prevalent Bright's disease and degeneration of the arteries. Sweetmeats and the mixtures of the drug-stores, ice-cream soda and artificial flavors, are other potent causes; especially among girls is the eating of candies between meals. The business man's five-minute meal at the lunch counter saves his business time often to the permanent ruin of his health. The question of alcoholic drinks is usually left to the forum of morals or politics; but it has a serious bearing on health, though not nearly so much as one or two generations ago. The introduction of light beers has not only lessened drunkenness, but organic diseases of the liver, stomach, heart, and arteries.

Few influences on general health have been greater or more beneficial than the enormous multiplication of the means of cheap enjoyable outdoor exercise in America within the past generation. Owing to the climate, it is much harder to keep up habits of steady exercise here than in Europe, and unless there can be sociability with it, most people will not put themselves under the stress. We have not been a people addicted to sport or play, and formerly there were not sufficient means provided for us. Now tennis and golf, and the bicycle and their kind, are improving the constitutions, especially the nervous condition, of vast numbers. Of course there must be judgment in these matters, and probably some elderly people injure themselves by indulging in severe athletic sport only fit for young people with sounder tissues.

Massage need only be mentioned; its aim is primarily to remove obstructions to circulation. The normal blood should be sufficient to establish normal bacterial and other conditions, and massage gives it the freest play. The essence of bathing, called when practised scientifically "hydrotherapy," is the same, save that its special function is to free the obstructed perspiratory system.

To these might be added a fourth, which in some sense is the most natural of all; for it has been practised in ages more remote by many thousands of years than the suspicion of either of the others, and by savages almost at the bottom of the human scale; that is, some form of suggestion or hypnosis. The main difficulty of this sort of treatment is that so little has been done to make it utilizable in practice, or to provide any certain means of assuring a definite result. Another is, that as with all the forms of mental science, its vagueness, its mystery, the impossibility of regulating its manifestations, surround it with so hopeless an atmosphere of fraud and of that open-mouthed credulity which irresistibly invites fraud. Yet after all, the psychological method has always played an important though largely unrecognized part

in therapeutics. It is from faith, which buoys up the spirits, sets the blood flowing more freely and the nerves playing their parts without disturbance, that a large part of all cures arises. Despondency, or lack of faith, will often sink the stoutest constitution almost to death's door; faith will enable a bread pill or a spoonful of clear water to do almost miracles of healing, when the best medicines have been given over in despair. The basis of the entire profession of medicine is faith in the doctor and his drugs and his methods. This is no new discovery: it was said by Galen that "he works the most cures in whom most have faith"; and the doctor-chemist-charlatan Paracelsus, who died of taking a universal panacea too poisonous even for his confidence, told his patients to have full faith and a strong imagination, and they would see the effects of it.

The subject of hypnotism, originally called mesmerism from its 18th century describer and practiser, can only be touched upon. Different practitioners have had such varying results from its use as to suggest that here too the personal equation is very important. Braid of Manchester, England, who first made a scientific study and attempt at utilizing it, was not successful; while an English surgeon in India, Esdaile, was highly successful, performing 268 operations on patients with all the effect of anæsthetics, not then introduced. Its possibilities have been greatly exaggerated, not so much by the claims of the persons using it (except impostors) as by the eager credulity of the public. It seems not so much to create a new condition of sensitiveness to suggestion, as to increase what normally exists. In organic disease it is practically useless. Its great service has been found to be in various affections which may all be classed as of the nervous system: hysteria, spasmodic functional complaints, children's vicious habits, and the victims of the drug and alcohol habits; occasionally in childbirth and surgery, but it is precarious and not free from serious dangers. It should no more be practised without witnesses present than dentists give nitrous oxide; and the law should restrict its practice to special licensees or physicians of a certain grade.

WILLIAM OSLER,

Of Johns Hopkins Medical School.

Medicine, American Academy of. See AMERICAN ACADEMY OF MEDICINE.

Medicine Dance, a common practice among the American Indians; dances being conducted by the medicine men of the tribe for various purposes, and in preparation for different events, like warfare, the hunt, etc. Both in the dance before a battle and in the conflict itself the medicine chief is the one man most worthy of consideration. If war takes place he courts the thick of the fight if for no other reason than to show his immunity from danger. The funeral dance of the Yaqui tribe is a representative example of the medicine dance; the chief medicine man arranging the ceremony, which ensures the safe passage of the dead to the spirit world. The dancers to the number of half a hundred appear in the centre of the assembled tribal gathering, naked except for a cloth about the loins. Their bodies are painted in imitation of skeletons. Over their heads they wear masks fringed with long horse-hair, dyed in many hues,

eyelashes and eyebrows hang over the rudely designed faces, and beards reach nearly to the waist. On their legs they fasten strings of rattles cut from rattlesnakes, and the sound of these is most greswome to the spectators. Each dancer carries two knives, one in each hand, with which he gesticulates violently in imitation of the act of slaying imaginary enemies. Every man dances after his own ideas, each seeming to outdo the other in the violence of the motion. Music for the dance is furnished by tom-toms. After the dance a great feast follows, continuing until midnight.

Medicine, Eclectic, embodies the principles and practice of the only established American school of medicine. The term Eclectic was not the most fortunate, for at no time has it adequately defined the school's position. When chosen, the term was very popular and was borne by several educational systems and books, and was moreover, well known to the laity. The name American School of Medicine, as proposed by Dr. A. H. Baldridge, one of its pioneers, would have been more expressive, would have avoided misunderstandings and would have saved the school much criticism regarding its position among the existing systems of medicine. Eclecticism is the direct successor of the American Reformed System of Medicine originated by Dr. Wooster Beach of New York city in 1825. It should not be confounded with Thomsonism (Thomsonianism), or the doctrines of the steam and herb doctors, promulgated and practised in the early part of the 19th century by Samuel Thomson of New Hampshire, the peculiar theories of which the Eclectic school never adopted; the majority of the followers of Thomson being among their most bitter antagonists. In later years, however, many of the Thomsonians joined the Eclectic school and creditably assisted in upbuilding it. The most successful organizer of the Eclectic school was Dr. Thomas Vaughan Morrow of Kentucky. The investigations in medical botany and materia medica by Schoepf, Benjamin Smith Barton, W. C. P. Barton, Constantine Rafinesque, William Tully and others gave an impetus to the movement which resulted in the establishment of the new school. The Reformed School of Medicine, by which name, what was later denominated Eclecticism was first known, was organized in opposition to the drastic practice of the dominant school of medicine,—bleeding, blistering, and the abuse of the salts of mercury and antimony,—against which Eclectics, as well as the followers of Thomson and Hahnemann, protested. Instead of these barbarous remedies the reformer sought to substitute milder measures and to employ vegetable medicines whenever possible. Yet, in the light of the present the substituted practice of the early reformers would be regarded as but little less barbaric than that which they sought to supplant. The basis of Eclectic philosophy was the sustenance of the vital forces, the avoidance of depleting remedies, and the selection, as with the ancient Eclectics, of the best of remedies and means from all sources, even despising not the primitive medicines of the untutored American Indians. They did not rest contented, however, with merely "selecting the best"; they endeavored to improve on such selections. To the reformer the practice of the dominant school was cruel

MEDICINE

and inhuman, the remedies barbaric. Out of the common stock of remedies he chose those best suited to his purpose in what he believed to be a more humane practice. He looked forward to certain ideals and objects not in accord with the views and practice of the dominant school. For his presumption in thus opposing the authorities in medicine and by inaugurating unwelcome innovations he was branded an irregular; was ostracised by the self styled regular physicians. An outcast, he was thus forced to organize a school in accord with his theories and practice.

There are three epochs in the history of Eclectic medicine,—the period of reformed medicine, from 1825 to 1845; the formative period, from 1845 to 1869, which was largely concerned in organization, and study of plant remedies; and the period of specific medication, from 1869 to the present, in which the best work of the school has been accomplished, and during which the theory of specific medication was promulgated and has been most largely practiced.

The educational history of Eclecticism dates from 1825, when Dr. Beach privately instructed students at his clinic in New York, where, in 1827, he established an Infirmary, which in 1829, he expanded into the Reformed Medical Academy. In 1830 it assumed the more dignified title of the Reformed Medical College of the City of New York. It was well equipped and continued in operation until about 1838. Text books of a high order were prepared by Dr. Beach. A national society was formed and from this body an expansion movement was begun by the selection, in 1830, of Dr. John J. Steele as an agent to proceed westward and explore the towns on the Ohio River with a view to selecting an eligible site for a branch of the New York College. A circular of the society having reached Worthington, Ohio, Col. James Kilbourne, president of Worthington College, invited the promoters to establish their school in that town. Dr. Steele accepted and Drs. Thomas Vaughan Morrow and Ichabod Gibson Jones were sent to perfect the organization. The Reformed Medical Department of Worthington College, as this school was called, entered upon a successful career in 1830, with Dr. Morrow as the leading spirit, but lack of proper facilities, the machinations of enemies, internal dissensions, and the financial crisis of 1837 caused it to be suspended in 1842. Dr. Morrow next moved to Cincinnati, Ohio, and assisted by Drs. Lorenzo Elbridge Jones and Alexander Holmes Baldrige, at once organized the Reformed Medical School of Cincinnati. In 1845 this college was chartered by the State of Ohio as the Eclectic Medical Institute. From this time the term *Eclectic* has been employed to designate the system and its physicians.

The formative period of Eclecticism began with the chartering of the Eclectic Medical Institute in 1845 and ended with the introduction of specific medication in 1869. During this period large classes attended the Institute. 'The Western Medical Reformer,' begun in Worthington in 1836 and suspended in 1838, was now revived and published as the 'Eclectic Medical Journal.' Barring a brief half year suspension this periodical has continued to be published to the present time. In this period, Dr. John King, justly styled the father of modern materia medica, began the publication of his numerous text

books, among which the 'American Dispensatory' gave the school an enduring and monumental work on materia medica. The pharmacy of the school advanced from crude drugs in powder, infusion, and decoction past the resinoid and alkaloid distraction to improved galenicals. In this connection be it recorded that Professor King discovered and introduced the resins of podophyllum and macrotys, which together with the alkaloids of hydrastis and sanguinaria, were afterwards prepared by Dr. William Stanley Merrell. These valuable agents together with the oleoresins of iris and capsicum attracted the attention of pharmacists. A host of indefinite compounds was added by others and the market was flooded with what purported to be Eclectic resinoids or concentrations. This heterogeneous class of pharmacals was denounced by Professor King and others who had sought to introduce only elegant and definite compounds. This much abused class of resinoids, served, however, a temporarily useful purpose in the evolution of a more perfect materia medica. Of these preparations, only those made after the methods of Dr. King, and the alkaloids of hydrastis and sanguinaria have survived and singularly are now mostly employed by practitioners of the dominant school. During this period Eclectic colleges were established at Rochester and Syracuse, Louisville, Philadelphia, New York, and Cincinnati. The majority of these were short lived and some of them had a strong leaning toward the system of botanic medicine now represented by the physio-medicalist. The Eclectic Medical College of Pennsylvania for many years in good repute, finally drifted away and during the later years (since 1871) was neither recognized by Eclecticism nor others. In 1856, a portion of the faculty of the Eclectic Medical Institute formed a rival college in Cincinnati which had a large following. This school was absorbed by the Institute in 1859. The Civil War seriously threatened the educational progress of the cause and the withdrawal of a large quota of Southern students caused a marked shrinkage in the attendance at the Northern schools. Times were hard and the outlook gloomy. Dr. John Milton Scudder, a graduate of the Eclectic Medical Institute in 1856, now became the head of that institution. By strict business management he inaugurated a period of renaissance and Eclecticism soon became a recognized force in medicine in America. Specific medication, introduced by Dr. John M. Scudder in 1869, though at first vigorously opposed, is at present the basis of practice of fully three-fourths of the Eclectic physicians and is the leading therapeutic doctrine taught in all the Eclectic colleges. In fact modern Eclecticism is the practice of specific medication. Its theory is as follows:—Disease is a wrong or impairment of life. It is manifested clinically by certain well defined symptoms. The totality of symptoms express a condition, to which, in the usual nosological classification, a special name is given. This disease name is of value only in the study of the natural history of diseases, for statistical data, for the purpose of recognizing contagious and infectious diseases, and for establishing a prognosis, certain necessarily fatal diseases allowing only of palliative treatment. The specific medicationist, like practitioners of other schools, pursues such a method of nosological

MEDICINE

diagnosis for the purposes named, but not as a guide to treatment, in which to him it is of little or no value. For therapeutic purposes he reverses this process and studies his case by analysis, not by synthesis, to discover if possible, the varying conditions which make up the disease, as evidenced by specific and well defined symptoms revealing disease expressions. Remedies have a certain force, and are definite in action. Like effects follow like causes. Hence, having found, by repeated experimentation, the opposing action of a drug in a certain condition of disease, as expressed by certain specific symptoms, objective or subjective, the same remedy will always relieve or cure like abnormal conditions. The believer in specific medication holds that there is a fixed relationship between drug force and disease expression.

The Eclectic has no specifics for *diseases* but specific remedies for specific conditions of such diseases. Specific diagnosis implies diagnosis to discover the condition curable by a certain remedy, as established by previous experimentation, and specific medication means the application of the known remedy for the pathological condition so found. Specific diagnosis is therapeutic, not nosological diagnosis. In practice the specific medicationist is guided in the selection of his remedy by "specific indications," as illustrated by the few following examples: The strong, excited, bounding pulse indicates *veratrum viride*; sharp, cutting or lancing pain in serous tissues, *bryonia*; the full, oppressed pulse with a sensation of *præcordial* fullness and dyspnea, *lobelia*; marked periodicity, with moist tongue, open pulse, and freedom from nervous excitement, *quinine*; cadaverous odor of the secretions, *potassium chlorate*, etc.

The modern Eclectic recognizes no law of cure, and does not accept a remedy as a specific until the extended successful employment of it in some particular condition has given it the right to be so called. Empiricism and experimentation are the foundations of knowledge concerning each remedy denominated a specific medicine. The havoc wrought Eclectic pharmacy at the close of the formative period had now to be remedied. The school had been nearly shipwrecked on the shoals of commercial selfishness, as seen in the instance of the *resinoids*. Calamities often bring about future good, so in this instance the commercial mistakes of a few gave a renewed impetus to better the conditions of Eclectic pharmacy. Uncertain preparations were supplanted by definite medicines. As a result the school has now a *materia medica* and system of therapeutics much sought by the descendants of those who endeavored to block the efforts of the pioneer Eclectic, in his zealous contention for pure and representative medicines. Dr. Scudder, supported by Dr. King and others, advocated office pharmacy as a step toward a better knowledge of drugs and to secure definite remedies. Special attention was given green and freshly dried products. Formulas were published for the preparation of specific medicines. Finally, in order to secure the integrity of these medicines and protect them from conscienceless manufacturers, Dr. Scudder copyrighted the labels. These bore the title "Specific Medicines" and gave the specific indications for their use. The manufacture of medicines bearing these labels was entrusted to competent pharmacists

and from that time the school has been free from objectionable pharmacy. Dr. Scudder advocated the use of specific medicines in the study of the relationship of medicine to disease expressions. The Eclectic of the formative period selected from other schools, but endeavored to improve. He substituted milder for harsher methods; he opposed the use of the lancet and blister, and the abuse of mercury and antimony salts. The modern American Eclectic advocates the use of kindly curative remedies, and the avoidance of depressing or depletive medication. He has been the pioneer in the study of the indigenous *materia medica*, with special reference to specific indications and specific uses of medicines employed. He contends for the best possible pharmacy so that the minimum amount of medicine may accomplish maximum results. Harmful medication as exemplified in excessive drugging he has consistently opposed, heroic over-drugging having been one of the most potent causes leading to the necessity for the establishment of an Eclectic school. He advocates liberality of thought, the highest medical education, the cultivation of professional dignity, and the ethics that govern gentlemen.

The position of the Eclectic school of medicine is now well established, and the attitude of malice and persecution formerly shown it by rival schools is fast becoming a memory. The school numbers upwards of 8,000 Eclectic physicians. For a period of about ten years this numerical relation has remained nearly stationary, but because of better facilities for teaching, enlarged literature, and harmony in the ranks of the school it has never occupied so favorable a position nor had a better outlook for the future than it has to-day. Never before in its history has it been so free from internecine bickerings, attacks by rival schools, and unpleasant entanglements and alliances. It challenges all ages in the wealth and completeness of its *materia medica*. Recognizing the merit of the work accomplished the regular profession in many localities now invites Eclectics to join its associations providing they drop their distinctive title. This the Eclectic is unwilling to do, believing that the school has earned the right to be regarded and recognized as a distinct sect in medicine. Its work in the special fields of *materia medica* and specific diagnosis and specific medication entitle it to this right. The Eclectic school has a strong national organization and numerous State and local societies. A national reform association was founded in 1829, and a second at Worthington, Ohio, in 1836. In 1848 the first National Eclectic Medical Association was organized in Cincinnati, Ohio, with Dr. T. V. Morrow as president, and it held annual sessions until 1858. The present National Eclectic Medical Association was organized at Chicago, Ill., in 1870, with Dr. John W. Johnson, of Connecticut, as president. It holds annual sessions, meeting in various cities throughout the United States. Eclectic practitioners now hold positions as examiners in the more important life insurance companies, and are not now debarred from the army medical service as in the earlier days of medical ostracism. No discrimination is now made against them as surgeons for the great railway systems. These recognitions have been earned in the face of vigorous medical op-

MEDICINE MAN — MEDINA

position, by the consistent and honorable course pursued by the Eclectic school as a whole. Eight colleges recognized by the National Society, are now actively teaching Eclectic medicine; two recently instituted are awaiting the required period of probation. These may be named as follows: Eclectic Medical Institute of Cincinnati, Ohio, the parent school of medical Eclecticism, chartered in 1845. Eclectic Medical College of the City of New York, chartered in 1865. Bennett College of Eclectic Medicine and Surgery, Chicago, Ill., organized in 1868. The American Medical College, of Saint Louis, Mo., incorporated in 1873. The California Medical College, of San Francisco, Cal., organized at Oakland in 1879. Eclectic Medical University of Kansas City, Mo., organized in 1897. Lincoln Medical College, Lincoln, Nebraska, reorganized in 1889. Eclectic Medical College of Indiana, Indianapolis, Ind., organized in 1900. American College of Medicine and Surgery, Chicago, Ill., organized in 1901. The Georgia College of Eclectic Medicine and Surgery, at Atlanta, Ga., was organized in 1866, but did not become actively Eclectic until 1886 when it was recognized by the National Association. These colleges are well organized and ably conducted. Organized co-operation is maintained between those recognized by the National Eclectic Association by means of a body known as the National Confederation of Eclectic Medical Colleges, organized under the direction of, and from members of the presiding association, in 1894, and composed of two delegates from each college. The object of this organization is to promote the mutual interest of the recognized colleges, to establish uniform minimum requirements and curricula, and to further the cause of higher medical education.

HARVEY WICKES FELTER, M.D.,

Prof. of Anatomy and Chemistry, Eclectic Medical Institute, Cincinnati, O.

Medicine Man, among the American Indians, South Sea Island tribes and other savages, a man supposed to possess mysterious healing powers. Among most savages the medicine man occupies much the same position as that held in civilized communities by two of the learned professions—medical and clerical. The medicine man is both priest and physician, and is at once the repository of all that a tribe knows, fears, and believes. In very low stages of human development, however, he is at best only a magician, dealing in terrors, possessed of occult powers, but laying claim to no special medical knowledge. Thus, among the aborigines of North Queensland, the tribal doctors do not attend specially on the sick—an invalid being cared for by wife or mother. They are not ostentatious, a medicine man being distinguished by no special insignia save a small bag in which his talismans, death charms, and other "credentials" are carried. These he hands about, much as a white man shows letters from influential people, and his friends taking note of them, he gets to be talked about, and grows quietly famous without undue advertisement.

Among the North American Indians medicine men are treated with great respect, and form a secret society with exclusive privileges and "exercise a terrible influence in degrading the people." It is curious to find that, as in Australia,

the Indian medicine men are chiefly concerned to do positive harm. In co-operation with good and bad spirits, they bring about the deaths of men or dogs at a distance. Among the Ojibways they are a kind of brokers in vengeance, and a coward or a hypocrite who wishes to be covertly avenged upon an enemy will bribe his tribal medicine man to employ the medical attendant of his victim. Then, if the victim dies, the instigators remain unsuspected, and the actual perpetrator of the crime probably goes scot free. Indian medicine men affect to suck out poison from a patient's body, or they cough up an arrow point or small, sharp piece of stone or bone which they suppose has been transferred from him to them by the evil spirit of another sorcerer. The medicine men of the Eskimos are even more extravagant in their pretensions. They say that they can prolong life indefinitely, and excuse their own mortality on the ground that, when they die, they have been overcome by some stronger medicine man. They profess themselves able to change into wood, stone, or animal, or even to walk on the water, or to fly, but they make a condition, which is that "no one must see them." An Eskimo medicine man rubs the seat of his patient's disease, blows on the part, and then withdraws his hand, "slowly and as if with difficulty, in order to show that he is hauling out a heavy weight of pain." "At the same time he looks upward, rolls his eyes, and groans." Then he throws the disease violently away, and breathing more freely, demands immediate payment of his fee.

Medicine, Preventive. See PREVENTIVE MEDICINE.

Medill, mè-dil', Joseph, American journalist: b. New Brunswick, Canada, 6 April 1823; d. San Antonio, Tex., 16 March 1899. Having early removed to Massillon, Stark County, Ohio, he was admitted to the bar in 1846, practised at New Philadelphia, and in 1849-51 published at Coshocton the 'Republican,' a Free-Soil paper. In 1852 he established at Cleveland the 'Forest City,' a Whig organ, which in 1853 was united with the 'Free Democrat,' and called the *Leader*. In 1855 he sold his interest in the *Leader*, removed to Chicago, with two partners purchased the *Tribune*, advocated radical anti-slavery measures, and supported Lincoln in 1860. He was a member of the Illinois constitutional convention of 1870, and was the author of the minority representation clause. He was appointed to the United States civil service commission in 1871, and in that year was elected mayor of Chicago. In 1874 he purchased a controlling interest in the *Tribune*, reorganized it as the Tribune Publishing Company, and became editor-in-chief of the paper.

Medina, Jose Maria, hò-sá' mā-ré'ā mā-dē'nā, Central American politician: b. Honduras about 1815; d. Santa Rosa 8 Feb. 1878. He was president of Honduras in 1862-3 and was re-elected in 1864-6 and in 1870. The war with Salvador in 1871 disturbed his hitherto successful administration and at the next election he was defeated by the Liberal party who elected their candidate Arias. Defeated again by Leiva in 1874 Medina raised an unsuccessful revolt in 1875-6 and in 1877 a second revolt was punished with death by court-martial.

MEDINA — MEDITERRANEAN SEA

Medina, mē-dē'na, Arabia, the native *Medinah-al-Nabi* or City of the Prophet, 248 miles northwest of Mecca, and about 105 miles northeast of Yemba on the Red Sea. It is celebrated for containing the tomb of Mohammed whence it ranks second to Mecca as a pilgrimage resort of Islam. It is situated in the most fertile spot of all Hejaz, with an immense plain extending south from it; in every other direction the view is bounded by hills or mountains. The town forms an oval, surrounded by a strong stone wall, flanked with towers, while on a rock, at its northwest side, stands the castle. Of its four gates, the east Bab-el-Misri, or Egyptian Gate, is remarkable for its beauty. Medina has no large buildings except the great mosque, two smaller ones, a college, and public baths. The houses are of stone, two stories high. Beyond the walls of the city, west and south, are suburbs consisting of low houses, yards, gardens, and plantations. These suburbs have also their walls and gates. The Mosque of the Prophet stands at the east side of the city, and resembles that at Mecca on a smaller scale. The tomb of the Prophet is enclosed with a screen of iron filigree, at the south side of which the pilgrim goes through his devotions, for all of which he pays, but is consoled with the assurance that one prayer here is as good as a thousand elsewhere. It is estimated that one third of the Mecca pilgrims go on to Medina, the pilgrimage to which may be performed at any time of the year. The inhabitants of Medina are mostly strangers who have settled and become naturalized in feelings, manners, and language. The population of Medina is supposed to be from 16,000 to 20,000, of whom 12,000 are within the walls. Since 1814 Medina has been the capital of the north paschalic of Arabia.

Medina, mē-dī'na, N. Y., village, in Orleans County; on Oak Orchard Creek, and on the Erie Canal, and on the New York Central & Hudson River railroad; about 35 miles northeast of Buffalo and 12 miles from Lake Ontario. The first settlement was made about 1830. In 1832 it was incorporated as a village. It is in a fertile agricultural region in which the chief products are grapes, apples, strawberries, and other fruits, and dairy products. In the vicinity are valuable sandstone quarries from which is obtained excellent building stone. The water-power is excellent and has been increased by a storage dam. Electricity is used as a power in manufacturing as well as for light. The chief manufactures are pumps, iron, foundry products, shirts, shoes, vinegar, flour, and furniture. It has a large trade in fruit and sandstone. The Medina Falls are visited annually by a number of tourists. The government is vested in a president and board of trustees. Pop. (1900) 4,716.

Medina-Sidonia, mā-dē'nā sē-dō'nē-ā, Spain, a city in the province of Cadiz, 23 miles by rail southeast of Cadiz, built in the form of an amphitheatre on a broad eminence, in the middle of an extensive plain, noted for its agricultural products and cattle rearing, which constitute the chief occupations of the population. A fine Gothic church, a town hall, and the ancestral palace of the famous dukes of Medina-Sidonia are the principal buildings. Pop. (1901) 12,397.

Medina (mē-dī'na) **Series**, in geology, a term introduced by the New York Geological Survey for a subdivision of the Upper Silurian series, apparently the base of that system. It is named from Medina, New York; occurs throughout the Atlantic States; and includes shales, conglomerates and sandstones. For the Medina sandstone see **LEVANT**.

Mediterranean (med'i-tē-rā'ne-an) **Sea**, the great inland sea between the continents of Europe, Africa, and Asia, the remnant—according to Prof. Suess—"of a great ocean which at an early geological epoch, before the formation of the Atlantic, encircled half the globe along a line of latitude." From its eastern extremity in Syria to the Strait of Gibraltar it is about 2,200 miles long; its maximum width from Venice to the Bay of Sidra is 1,200 miles. The shores of Europe are on the north and northwest, those of Africa on the south, and those of Asia on the east. The Mediterranean is connected with the Atlantic by the Strait of Gibraltar, and on the northeast with the Black Sea through the Dardanelles, Sea of Marmora, and the Bosphorus, which form a continuous waterway. It is irregular in shape, and by the projection of the south part of Italy, and of Cape Bon in Africa, and the interposition of the island of Sicily, is divided, near its centre, into two distinct portions, an east and a west. In addition to these, the other important subdivisions are the Tyrrhenian or Tuscan Sea, between the west coast of Italy and the islands of Sardinia and Corsica; the Adriatic Sea or Gulf of Venice, between the east coast of Italy and the west coast of Turkey in Europe and Dalmatia; the Ionian Sea, between the west coasts of Turkey in Europe and Greece, and the south part of Italy and the island of Sicily; the Aegean Sea or Archipelago, between Turkey in Europe and Greece on the west and Turkey in Asia on the east; and the Levant, which is usually understood to include the whole sea east of the island of Crete. The largest gulfs are, on the shores of Europe, those of Lion or Lyons, Genoa, Tarranto, Lepanto, Koron, Kolokythia, and Salonica; on the shores of Asia, Adrymiti, Smyrna, Adalia, and Skanderoon; and on the shores of Africa, Sidra and Cabes. The largest and most important islands are Sicily, interposed, as already mentioned, between the two great divisions of the sea, Sardinia, Corsica, and the Balearic Isles, in the west division; and Cyprus, Rhodes, Crete, the Ionian Isles, and Malta, in the east division. The principal rivers which discharge themselves into the Mediterranean are the Ebro, Rhone, Po, and Nile; but its communication with the Black Sea entitles it to claim it as part of its basin, and, consequently, also the great rivers Don, Dnieper, Dniester, and Danube. Between Cape Bon and the Sicilian coast, where the sea is shallowest, the depth varies from 30 to 250 fathoms; but in almost all other places, particularly at a distance from the shores and islands, the depth is very much greater, the maximum depth in the eastern division being 2,150 fathoms, in the western division, 2,040 fathoms. Owing to the very narrow channel which connects the Mediterranean with the main ocean, there is very little tide; though in some places, as in the Ionian Sea, the Adriatic, on parts of the African coast, etc., a rise of more than 6 feet sometimes occurs. The prevailing

MEDITERRANEAN SUBREGION — MEEHAN

winds are the southeast and southwest in spring, and the northeast and northwest during the rest of the year. They often rise suddenly and with great violence. The most remarkable are the historic Euroclydon or Levanter, mentioned in Acts xxvii. 14, a northeast wind of dangerous whirlwind characteristics; the Bora in the Adriatic; the Etesian and Tramontana in the Ægean; and the burning Sirocco from the African desert. The Mediterranean abounds with fish, and also furnishes the finest coral and sponge. The evidences of volcanic action along its shores are present in the active volcanoes of Vesuvius, Etna, and Stromboli (qq.v.). Consult Playfair, 'The Mediterranean, Physical and Historical' (1890).

Mediterranean Subregion, a zoogeographical district of the Nearctic Region, embracing the basin of the Mediterranean and the plains of Syria. Faunistically this region is allied to Europe rather than to Africa or Asia, from which it is separated by deserts. It includes many sub-tropical forms, rarely or never seen north of the Alps or south of the Atlas Mountains. See ZOOGEOGRAPHY.

Medjidie, mē-jēd'ē, a Turkish order of knighthood, instituted by the Sultan in 1852. It has been conferred on numerous foreign officers, soldiers, and seamen, who have taken part in wars on behalf of Turkey. The name is also given to a modern Turkish silver coin, value about 85 cents.

Med'lar, a small tree or shrub (*Mespilus germanica*) of the rose family and a native of southern Europe where, in the wild state it has thorns, but in cultivation it is thornless. It differs from various near relatives, such as apple and pear, in bearing solitary, large, white, terminal flowers upon leafy growths of the current season, and, like the quince, in having no detachable peduncle to the fruit in which the receptacles do not completely overgrow the ovaries. It is widely grown in Europe but much less in America. In Central New York it is fully hardy and produces well with no special care. The top-shaped fruit, which is about the size of a small pear, should be allowed to hang until after a frost, which mellows its austerity and assists the process of "bletting," as ripening in cool dry rooms is called. When in a state of incipient decay the softened fruits are eaten by those who enjoy tart flavors, or are made into preserves.

Medoc, mā-dōk, a wine which derives its name from a district of France, in the ancient province of Gascony. It is mostly covered with vines, which are cultivated with great care, and the wines produced from which have a high reputation. See WINES.

Medulla, in botany, the pith of a plant-stem. See PITH.

Medulla Oblonga'ta, the brain-stem, or that part of the nervous system that lies between the pons, or pons Varolii, at the upper end, and the spinal cord proper, with which it is continuous, at its lower end. It is a very old part of the nervous system, judged from the standpoint of evolution, and in it are located the important centres of most of the cranial nerves, including the centres that govern the nerves of the heart and of respiration. It is a triangular cone-like portion of the nerve-axis, about an inch in

length and one half to three quarters of an inch thick, being tubular below and flattened above. Below, it closely resembles the cervical cord in its internal construction, but above great changes take place to accommodate important new structures. One of the most conspicuous features of the medulla consists in a triangular enlargement of the central canal of the cerebro-spinal axis, constituting what is known as the fourth ventricle. The lower seven cranial nerves have their apparent origin in the medulla, and the first spinal nerve also originates in the medulla proper. The internal anatomy of the medulla is complicated. At the lower end the chief motor tracts, the pyramidal tracts that come from the motor area (q.v.) in the brain cross one another to pass down on opposite sides of the spinal cord. It is because of this decussation that a hemorrhage of the brain of the right side causes a paralysis of the muscles of the left side of the body, and *vice versa*. Just above the decussation of the pyramids the end-stations (nuclei) of the two chief sensory tracts of the body are located. It is into these nuclei—the gracilis and the cuneatus—that all of the sense-impressions from the body below the head are collected, to be passed to higher cerebral centres through the lemniscus or sensory fillet. The chief gray masses in this part of the brain are the nuclei of the cranial nerves referred to, and of the olives, two structures of undetermined function. The best description of the oblongata at present is that of the model of the medulla and pons by Dr. Florence Sabin, which is figured in Barker's 'Nervous System.' Consult also: Buck, 'Reference Handbook of the Medical Sciences,' article "Brain," and Johns Hopkins Hospital Reports, Welch Memorial Volume. See BRAIN.

Medusa, me-doo'sā. See GORGO.

Medusa, a disk-bearing jellyfish (q.v.).

Med'way, England, a river which rises in the county of Sussex and flows northeast in a winding course across Kent, past Tunbridge and Maidstone, to Rochester and Chatham. Below Chatham it spreads out into a broad tidal estuary, in which are several islets, and joins the Thames at Sheerness. It is 70 miles long and is navigable to Penshurst, 20 miles above Chatham.

Meehan, mē'an, Thomas, American scientist: b. Potter's Bar, near London, England, 21 March 1826; d. Philadelphia 19 Nov. 1901. From his father, a gardener, he learned facts of natural history when a child; at 8 made and recorded an original discovery in herpetology; taught himself from books read at night after daily tasks; at 12 began to publish scientific papers; soon after produced the first hybrid fuchsia; and was nominated to membership in the Royal Wernerian Society. For two years he held a position at Kew Gardens. In 1848 he came to America and took charge of Bartram's Gardens in Philadelphia. In 1854 he established the Germantown Nurseries, which he conducted until the end of his life. For 30 years (1859-89) he edited the 'Gardeners' Monthly,' and contributed papers to many other periodicals and to scientific societies. For 23 years he was senior vice-president of the Philadelphia Academy of Natural Sciences, in whose proceedings were published his important 'Contributions to

MEDUSA LIKE ANIMALS

the Life History of Plants.' In 1875 he was elected a fellow of the American Academy for the Advancement of Science, before which, among other noteworthy papers, he read 'A Contribution to the Doctrine of Evolution and the Theory of Natural Selection,' which showed him as a co-worker with Darwin and other evolutionary scientists, in whose field he also was a discoverer. From the creation of the office until his death he served as State botanist of Pennsylvania, at one time was a member of the board of visitors of Harvard, and was one of the American editors of the 'Encyclopædia Britannica.' His travels and researches extended throughout the country, including Alaska. In 1878 he began the publication of 'Native Flowers and Ferns of the United States,' an illustrated serial covering a wide field of floral distribution, the main features of which he continued in 'Meehan's Monthly,' founded in 1891. Many learned societies abroad enrolled him, and he held intimate relations with nearly all the leading scientists of his time. Among his closest friends was the Comte de Paris, a devotee of plant-study. Meehan was the third American to receive the Veitch medal, awarded to him for "distinguished services in botany and horticulture." Apart from scientific work he devoted himself to public labors; was a member of the Philadelphia common councils from 1882 until his death; during the same period served on the local school board; in both capacities introduced many reforms; and chiefly through his efforts nearly 30 small parks were added to the city. A work of permanent value is his 'American Hand-book of Ornamental Trees' (1853).

Meek, mèk, Alexander Beaufort, American jurist: b. Columbia, S. C., 17 July 1814; d. Columbus, Miss., 30 Nov. 1865. He was graduated from the University of Alabama in 1833 and admitted to the bar two years after. He served in the Seminole War 1836; was attorney-general of Alabama 1836; judge of Tuscaloosa County 1842-4; and member of the legislature in 1853. While there he established the free-school system of Alabama. In addition to a legal digest (1842) he wrote: 'The Red Eagle' (1855); 'Songs and Poems of the South' (1857); 'Romantic Passages in South-western History' (1857); etc. His best known poem is 'The Charge at Balaklava.'

Meek, Fielding Bradford, American palæontologist: b. Madison, Ind., 10 Dec. 1817; d. Washington, D. C., 28 Dec. 1876. His educational advantages were limited, but his interest in natural history made study imperative to him, and in 1848 he became assistant to David D. Owen in a geological survey of Iowa, Minnesota, and Wisconsin. He assisted James Hall at Albany in 1852-3, spending several summers in a geological survey of Missouri and Nebraska, and in 1858 went to Washington, where he devoted the remainder of his life to palæontologic investigations under the government. He was elected in 1870 to the National Academy of Sciences, and was a member of other scientific organizations. Among his writings are: 'Check List of the Invertebrate Fossils of North America' (1864); 'Report on Invertebrate Cretaceous and Tertiary Fossils' (1876); etc. For a complete list of his works, see bibliography published by the Smithsonian Institution.

Meer'kat. See SURICATE.

Vol. 10—27

Meekins, mè'kinz, Lynn Roby, American journalist: b. Salem, Md., 14 Nov. 1862. He was graduated from Western Maryland College, Westminster, Md., in 1882, and devoted himself to journalism. He was literary editor of the Baltimore *American* 1882-9, when he became managing editor of the Philadelphia 'Saturday Evening Post,' and since 1903 has been editor of the Baltimore *Herald*. He has published: 'The Robb's Island Wreck' (1894); 'Adam Rush' (1902); etc.

Meeks, Eugene, American painter: b. New York 1843. He studied under Wust, at The Hague, and under Van Lierus at Antwerp. In 1883 he received the title of professor from the Academy of Florence, in which city he had made his permanent residence. His Venetian pictures include 'Gondola Party' and 'Fishing Boats,' and he has successfully handled a *motif* taken from Dickens, in his 'Little Nell and Her Grandfather' (1876).

Meerschaum, mèr'shâm or -shum, a name given to one of the silicates of magnesium; it is a mineral of a whitish or creamy color, and received its name from its appearance and the position in which it is sometimes found suggesting that it was petrified foam of the sea. It is obtained from various places, but the best quality comes from Asia Minor, rich deposits of it existing about 20 miles southeast of Eskichehir, at a place called Sepetdje. There are some 20,000 pits in a space of six miles, of which only 150 are worked, all the others being exhausted. It is said that these mines were opened 1,000 years ago, which is not incredible, as it is well known that magnesia was formerly used for many purposes, other than the fabrication of pipes; moreover, fuller's earth used to be worked on a vast scale by the ancients. The meerschaum mines are worked by some 500 miners, who live in the surrounding villages. At Gheikli, in the neighborhood of Sepetdje, there are 3,000 pits, of which only 100 are worked, giving employment to 400 miners. The mineral is mined in blocks, which are taken to Eskichehir, where the blocks are cleaned, the operation consisting of scraping and cutting the blocks with a sharp instrument or knife, the meerschaum being still soft and easily cut into any shape or form. Over 1,100 persons are occupied in cleaning and shaping these blocks, which, after being thoroughly cleaned, are separated into four classes, according to size and quality. These blocks being ready for sale, a bargain is struck between the pipe manufacturers and the commission agents and merchants at Eskichehir, of whom there are about a dozen. The latter then pack the blocks of these four classes with very great care into boxes of equal size, each block being wrapped in cotton to avoid any friction or shock between the pieces. The actual annual output of these mines varies from 120 to 150 tons. It is soft when dug up, but becomes hard when dry. Most of it is sent to Vienna, where it is chiefly made into tobacco-pipes, many of them highly artistic. Similar pipes are also made in Paris, London, and elsewhere.

Mees, Arthur, American musical director: b. Columbus, Ohio, 13 Feb. 1850. He was graduated from Concordia College, Fort Wayne, Ind., and studied music in Berlin. He has been assistant director, and later director, of some of the leading operas and musical associations, and

MEG MERRILIES—MEGAPODES

has published, in addition to his annotated programmes for the New York Philharmonic Society and the Chicago Orchestra, 'Chorus and Choral Music.'

Meg Merrilies, mër'y-lêz, a gipsy in Scott's 'Guy Mannerling.' She is a romantic figure, half insane, but entirely devoted to the Bertrams. She dies as she brings to his own again Harry Bertram. Charlotte Cushman (q.v.) was famous as Meg Merrilies in the dramatization of the novel.

Megalithic Monuments. See **DOLMEN**; **MENHIR**; **STANDING STONES**; **STONE CIRCLES**.

Megalonyx, an extinct mammal allied to the sloths, etc., the fossil remains of which are found in post-tertiary deposits in North and South America. It was allied to the Megatherium (q.v.), and its average size was about that of a horse.

Megalopolis, mæg-a-löp'ô-lis, or **Sinanon**, Greece, a ruined city on the ancient Helisson, in the monarchy of Gortynia, 5 miles north of Leondari. It was founded 370 B.C. by Epaminondas, as the federal capital of Arcadia, and was frequently but unsuccessfully attacked by the Spartans. In 222 B.C. it was captured and partially destroyed by Cleomenes III. From 1800-3 the British School at Athens excavated the site and revealed the Precinct of Zeus Soter, the Agora, the Stoa of Philip and the Stoa of Myropolion on the right bank of the river, and on the left bank, the Theatre and Scanotheca, the Thersileon or great assembly hall, altars, and remains of other buildings described by Pausanias. Consult Schultz and Loring, 'Excavations at Megalopolis' (1892).

Megalosaurus, mæg'a-lô-sâ'rûs, a genus of huge carnivorous dinosaurs of the group *Theropoda*. Their remains occur in a fragmentary way in the European oölitic rocks. See **DINOSAURIA**.

Megaphone (a Greek word meaning 'great sound'), an instrument devised by Thomas A. Edison for carrying the sound of the voice long distances without the aid of wires. It consists of two large funnel-shaped receivers in which the waves of sound are collected and concentrated and carried by means of flexible tubes held to the ears of the person using the instrument. In the instrument called telephone-megaphone, the mouthpiece of the telephone is connected with four transmitters which multiply the usual telephone sound of the voice by four, and it is sent by wire, so increased, into the megaphone, which sends it forth into space with sufficient intensity to carry it with perfect distinctness throughout a large church or hall. The ordinary megaphone is largely used by deaf persons.

Megapodes, a general name for the brush-turkeys or mound-birds of Australia constituting the gallinaceous family *Megapodiidae*, so named in reference to the disproportionately large size of the feet; and remarkable for their breeding habits. The family, although mainly Australian, is represented in many of the South Sea Islands and in the Philippines, replacing the pheasants, which are absent from that region. There are 7 genera and 20 or more species, mostly with restricted individual ranges, and varying in size from that of a turkey to that of a large pigeon, the sexes being always alike in plumage. The

general colors are browns and yellows with the naked wattled parts brightly colored. They have a short, strong bill; the head and neck almost naked and wattled; the wings short and round, the tail large; the legs and feet large, strong and provided with great claws. Megapodes are terrestrial birds found in hill-valleys, among thickets or along river and sea beaches. They run well, but if hard pressed will take to trees where they hop about awkwardly; their flight is heavy, but may be long sustained. Hoarse, chuckling, cackling or mewing cries express the utterances of the different species, which are often heard at night. The food consists of fallen fruit, seeds, berries, worms, snails, insects and even small crabs. The flesh is dark-colored and not good, though palatable to the Australian aborigines.

One of the best known species is the brush-turkey or mound-turkey (*Cathartus lathamii*), also known as the wattled talegalla and the New Holland vulture, the latter name being given to it on account of its yellow, naked head and neck, covered in part with fleshy wattles. It is rather common in New South Wales, inhabiting the most thickly wooded parts. It is a large bird, about the size of a turkey, with blackish-brown plumage. It is shy, and when pursued, endeavors to escape by running through the thickest brush, or by leaping to the lowest branches of a tree, and thus avoids the dingoes or native dogs, which, however, often hunt it down on open ground. It is easy game to the sportsman, who finds it roosting under shelter of the branches of trees during the heat of the day, and although several of a flock are shot, the rest keep their place undisturbed. They are generally seen in small flocks, and make their nests together, the females heaping up, by means of their feet, mounds of several cartloads of earth and decayed leaves, which are used from year to year, new materials being added every year. The eggs are separately buried, often by several females, within the mass, where they are hatched by the heat of the fermenting mound. The parent birds partially uncover them during the day. Nearly a bushel of eggs may sometimes be found in a single heap. The male bird pays great attention to the young after they are hatched, covering them up partially in the mound at night for warmth. The flesh of the talegalla is excellent, and the eggs are also very delicate and eagerly sought after. Two other species occur in New Guinea.

South and West Australia have another familiar megapode in the mallee-hen or 'native pheasant' (*Lipoa ocellata*)—a large gray-brown bird with eye-like markings on the wings and back, and the naked neck and wattles blue; its mounds are comparatively small and often made individually. A bird often confounded with this in books because of similarity of name is the maleo (*Megacepalon maleo*) of North Celebes, which has the singular habit of making a general migration in the breeding season to the sea-beach, where small groups of females dig large holes in the sand just above high-water mark, and day by day bury eggs there until the quota of each is laid; these gradually hatch under the influence of the hot sand. The largest genus is *Megapodius*, whose 15 species are scattered over all the island region between Samoa, the Philippines and the Micobars, each group having a distinct species. The most widely

distributed and best known is *M. tumulus*, the common mound-bird or scrub-turkey of Northern Australia and the Papuan archipelago, which fashions mounds 10 or 11 feet high in the densest woods, continues to use them year after year, and lays pale, coffee-colored, thin-shelled eggs in straight burrows penetrating the mound. In some islands the eggs of these birds are an important food resource. The young are well fledged when they emerge from the egg and scramble out of the mound, but are attended to by their parents for some time. Consult Newton, 'Dictionary of Birds' (1896); 'Proceedings,' Zoological Society of London, 1876, 1888, etc., and works on the ornithology of Australia and Oceanica.

Meg'apolen'sis, Joannes, Dutch Protestant missionary to the North American Indians: b. Koedyck, Holland, 1603; d. New York 24 Jan. 1670. His family name, van Mekelenburg, he Hellenized to Megapolensis. In 1642 Van Rensselaer, the first Patroon, brought him to New York from Holland, and he soon learned the Mohawk tongue and preached successfully among the Indians near Albany, several years before John Eliot's mission or any other Protestant preaching to the Indians. From 1649 until his death he was pastor of the Dutch church in New York, where he showed little tolerance to Lutherans and Independents. He advised peaceable surrender to the English in 1664. His account of the Mohawks is published in the third volume of the New York Historical Society's 'Collections' (1870).

Meg'ara. See MEGARIS.

Megar'ic School. See MEGARIS.

Megar'is, mēg'a-ris, Greece, the name of an ancient state or small district bounded north by Boeotia, east by Attica, south by the Saronic Gulf and the territory of Corinth, west by the Corinthian territory and the Corinthian Gulf; area, about 143 square miles. It is a mountainous country, the only plain being that on which the capital was situated. Mount Cithæron was on the north boundary, separating it from Boeotia. The only important town was Megara, situated a mile from the sea, opposite the island of Salamis. It contained a Pelasgian citadel, called Caria, on a hill northwest of the city, with a temple to Demeter called Megaron, from which the name of the town is supposed to be derived. Another citadel of more modern date is situated on a lower hill to the southwest, and the town lies at the foot of the two. A seaport, Nisæa, was connected with it by two walls. The first known inhabitants were Leleges. It had flourishing colonies at an early period, and its navy was so powerful that it was only after a long struggle with it that Athens obtained possession of Salamis. It afterward became annexed to Attica, of which Megaris formed one of the four ancient divisions. It was successively conquered by the Dorians and the Corinthians, but afterward asserted its independence, and became wealthy and powerful. Euclid was a native of Megara, and there founded the celebrated Megarian school of philosophy which combined Socratic ethics with Eleatic metaphysics. In the Roman period it ceased to be a place of any importance. A town of the same name now occupies the ancient site. Pop. 6,500.

Megathe'rium, a gigantic fossil ground-sloth, the largest known edentate, representing

the family *Megatheriidae*, and especially the species *Megatherium americanum*, whose remains are found plentifully in the Pleistocene strata of Argentina and Patagonia. These early edentates were so generalized, that, as compared with modern forms, they exhibit the head and teeth of a sloth, associated with the vertebræ, limbs and tail of the ant-eater. Some of them attain a gigantic size, at least as large as an elephant, but with shorter limbs and a bigger tail, and the latest species are the most bulky. *Megatherium*, according to Woodward, seems to have been entirely destitute of dermal armor. The only one of its allies in which bony plates have been discovered is *Myodon*, and they are very small and not fused together. The mylodons were somewhat smaller than the megatheria, with a skull and teeth more like those of the modern sloths, and the three inner digits of the forefoot bear claws, about equal in size, instead of the huge middle-finger claw of the *Megatherium*. In both animals the hind foot lacks digit I, but II. and III. bear claws. The typical species of mylodon (*M. harlani*) was about as large and of much the same form as a rhinoceros, and inhabited the southwestern United States, while various other species lived in South America. The long-headed South American genera, *Scelidotherium* and *Megalonyx*, are other forms of the same family. Consult the palæontological writings of Leidy, Lydekker, and Woodward.

Megna, mēg'na, or **Meghna**, India, the estuarine outlet of the Ganges and Brahmaputra (qq.v.), in Bengal. The tidal bore is characterized by its velocity, which endangers navigation, advancing at the rate of 15 miles an hour, and frequently attaining a height of nearly 20 feet.

Megrim. See MIGRAINE.

Mehemet, mā'hē-met, or **Mohammed**, mō-ham'ed, **Ali**, ā'lē, viceroy of Egypt: b. Kavala, Macedonia, 1769; d. Cairo 2 Aug. 1849. An orphan, he was brought up by a janizary captain, governor of Kavala, who married him to a kinswoman and made him a militia officer. When the French invaded Egypt he was sent there, rose rapidly, became the confidant of Koshrew, pasha of Egypt, and, by treachery both to the pashas and the Mamelukes and by a liberal use of his wealth, in July 1805 became pasha of Cairo, whence his power quickly spread over the rest of Egypt. His utterly unscrupulous policy was shown by his massacre of nearly 1,700 Mamelukes in 1811. He extended the limits of Egypt by wars on the Arabian Waha-bees, by the possession of Nubia and Kordofan, and by the treacherous conquest of Syria, in which he aimed at independence of the Porte. This first break with Turkey was settled by the Powers; and in 1839 the Sultan was forced to call on the Powers to help him turn Mehemet out of Syria; by the treaty then concluded he surrendered Syria, Candia, and Hejaz; but was made hereditary pasha. His internal administration was vigorous; both agriculture and manufactures flourished, thanks to French capital solicited by Mehemet, who introduced European methods into his army also. He was insane during the latter part of his life, and was succeeded by his grandson; his son, who took his place as regent in September 1848, died in November of that year.

Méhul, Etienne Henri, â-tê-ën ôñ-rê mâ-ül, French musical composer: b. Givet (Ardennes) 22 June 1763; d. Paris 18 Oct. 1817. He studied at Paris under Gluck; and after the departure of the latter for Vienna, Méhul presented to the Royal Academy of Music the opera of 'Cora and Alonzo,' the representation of which was delayed for six years. He then turned to the Opéra Comique, which gladly received his 'Euphrosine and Coradin' in 1790. His patriotic hymns, 'Chant du Départ,' 'Chant de Victoire,' and 'Chant Retour,' greatly increased his fame. He was chosen a member of the Institute in 1796, of the Academy of Fine Arts in 1816, and a knight of the Legion of Honor in 1802. His chief operatic work is 'Joseph' (1807). His style as a composer is remarkable for dramatic force and coloring. There is a 'Life' by Pougin (1889). His statue was erected in his native town in 1892.

Meibomia, a genus of erect perennial herbs of the pea family, of which about 150 species are natives of warm and temperate America, Africa, and Australia. More than 40 species belong to the United States, some of the more familiar of which are called "tick-seeds."

Meiggs, mēgz, Henry, American contractor: b. Catskill, N. Y., 7 July 1811; d. Lima, Peru, September 1877. He was engaged in the lumber business in New York and other places but met with financial reverses and in 1848 went to California, where he again took to the lumber business and gained an immense fortune. Reverses, however, once more swept away his wealth, leaving him with an indebtedness of more than \$1,000,000. He fled with his family to Peru, where he soon embarked upon a series of bridge- and railway-building enterprises, which won for him immense wealth and a world-wide fame as a railway contractor. His engineering achievements in South America comprise some of the most daring feats in the history of the profession. The construction of the Callao, Lima, and Oroya road, which crosses the Andes and ascends to a height only 136 feet lower than the summit of Mount Blanc, was his crowning achievement, and was practically completed at his death. He paid in full the enormous obligations incurred by his failure in San Francisco, contributed generously to charities in the United States and Peru, and by the laying out of a beautiful park, which he presented to the city of Lima, materially changed for the better the appearance of the city.

Meigs, Montgomery, American civil engineer: b. Detroit, Mich., 27 Feb. 1847. He was educated at Harvard and in Germany, and was for several years in the employ of the Northern Pacific railroad. Since 1882 he has had charge of the Des Moines Rapids Canal under the government. He is the inventor of a "canvas coffer-dam." He also constructed the United States dry dock at Keokuk.

Meigs, mēgz, Montgomery Cunningham, American military officer: b. Augusta, Ga., 3 May 1816; d. Washington, D. C., 2 Jan. 1892. He was graduated from West Point in 1836 and entering the engineering corps the next year was engaged in the construction of forts Delaware, Wayne, Porter, Niagara, Ontario, and Montgomery until 1852, when he took charge of the building of the great Potomac aqueduct. In

1860 he built Fort Pickens in Florida, and in 1861 was appointed quartermaster-general of the United States army and given rank as brigadier-general. He was promoted major-general in 1864, and in 1875-6 he was sent by the government to Europe to make an inspection of various staff-departments, the quartermaster's in particular. After his retirement in 1882 he was engaged in preparing plans for various public buildings in Washington. He was a regent of the Smithsonian Institution and of many scientific societies, and was at his death architect of the Pension building.

Meigs, Return Jonathan, American soldier and pioneer: b. Middletown, Conn., December 1734; d. at the Cherokee agency, Ga., 28 Jan. 1823. At the commencement of the Revolutionary War he raised a company of men and marched to the American camp at Cambridge, subsequently accompanied Arnold on his expedition against Quebec, where he was taken prisoner, and after his release was commissioned a colonel in the Continental army. He signalized himself by a brilliant expedition against a British post at Sag Harbor on Long Island, for which he received the thanks of Congress and a sword, and took a distinguished part in the capture of Stony Point under General Wayne, and elsewhere in the course of the war. In 1788 he emigrated to Ohio, and established himself at Marietta. In 1801 he was appointed by President Jefferson Indian agent of the Cherokees, among whom he passed the remainder of his life.

Meigs, Return Jonathan, American soldier and politician, son of the preceding: b. Middletown, Conn., November 1705; d. 29 March 1824. He was graduated from Yale in 1788, went to Marietta, Ohio, with his father in 1788 and rose to prominence there as a lawyer. He was chief justice of the Ohio supreme court 1803-4; served in the army as a brevet colonel 1804-6; was a judge in Louisiana 1805-6; and in Michigan for the two years following. After being senator from Ohio 1808-10 he was governor of that State for the next four years, in which period he was an active supporter of the war measures of 1812-14. He was postmaster-general of the United States 1814-23.

Meigs, William Montgomery, American lawyer and biographer: b. Philadelphia, 12 Aug. 1852. He was graduated from the University of Pennsylvania in 1872, studied law and was admitted to the bar in 1879. In addition to his law practice he has devoted much time to literary work and is author of 'Life of Joseph Meigs' (1887); 'Life of Charles Jared Ingersoll' (1897); 'The Growth of the Constitution' (1900); etc.

Meiklejohn, mī'k'l-jōn, George D., American lawyer: b. Weyanwaga, Wis., 22 Aug. 1857. He was graduated from the University of Michigan in 1880 and established himself in a law practice at Fullerton, Neb., in that year. He held several public offices and in 1884 and 1886 was elected state senator. In 1889 he was elected lieutenant-governor of Nebraska and in 1893-7 served as member of Congress. He was appointed assistant secretary of war in 1897 and filled that post through the war with Spain, retaining his office after the resignation of Secretary Alger, until 1901, since which time he has been engaged in his law practice at Fullerton.

MEILHAC — MEISTERSINGERS

Meilhac, Henri, òh-rê mā-yāk, French playwright: b. Paris 25 Feb. 1831; d. there 6 July 1897. His work as a dramatist begun in 1855, was attended at first by scant success, but he finally became a favorite playwright. Much of his work was done with Halévy (q.v.). He furnished the book for Offenbach's 'Grande Duchesse,' 'La Pêrichole,' and 'Les Brigands,' and other works of that composer. Among his independent plays are 'Petite Marquise' and 'Décoré.' In 1888 he was elected to the Académie Française.

Meiningen, mī'ning-ën, Germany, the capital of the small Duchy of Saxe-Meiningen, in a narrow, well-wooded valley, on the Werra, 40 miles southeast of Erfurt. It is an attractive modern town with regular and handsome streets, having been practically rebuilt since the disastrous fire in 1874 which destroyed the old town. The principal buildings are the new town-house and the ducal palace with a church, private and public library, picture gallery, museum, etc., attached. The stock company of the local theatre which for sixteen years enjoyed a European reputation for the excellence of its acting and staging, was dissolved in 1890. The industries are only of domestic importance and include brewing, woolen and cotton-weaving. Pop. (1900) 14,518.

Meiningen Company, a celebrated company of German actors, under the management of Duke George of Saxe-Meiningen and the actor Chronéck. They gained the highest reputation for the historical accuracy and beauty of their scenery, dress, and mounting. They appeared at Drury Lane Theatre, London, in 1881. The company was dissolved in 1890.

Meissen, mī'sën, Germany, a town of Saxony, founded by Henry I. in 922-33, 14 miles northwest of Dresden, on the left bank of the Elbe, at the confluence of the Meisse and Triebisch. It has a noble Gothic cathedral, of the 10th century; an old castle of the Margraves, erected in the 15th century on a precipitous rock above the town, recently restored, the Franciscan church, a large and magnificent edifice, used as the custom-house; the church of Our Lady, or city church; the ancient church of St. Nicholas; and other public buildings. The royal porcelain factory, first established by Boettcher (q.v.), and now at some distance from the town, is the great industrial establishment of the place; there are also manufactures of safety matches, stoves, iron foundries and machine-works, a jute-mill, breweries, etc. Meissen is the see of an archbishop. Pop. (1900) 20,123; since 1901, 31,432, owing to the incorporation of the suburban municipality of Cölin.

Meissonier, Jean Louis Ernest, zhōh loo-ë ér-nā mā-sō-nē-ä, French painter: b. Lyon, France, 21 Feb. 1815; d. Paris 31 Jan. 1891. He came to Paris in early youth and entered the studio of Cogniet, meanwhile forming his style on the Dutch masters as represented in the Louvre. He first attracted attention by his illustrations of the Bible, Bossuet's 'Universal History,' 'Orlando Furioso,' 'Paul and Virginia,' etc. His earliest paintings in genre to be exhibited in the Salon were 'The Little Messenger' and 'The Chess Player' (1836). His reputation grew rapidly on the

successive appearance of 'The Monk' (1838); 'The English Doctor' (1839); 'The Chess Party' (1841). The times of Louis XIV. and Louis XV. with all the accessory richness and variety of costumes, weapons and domestic luxury, began to find in him their most successful delineator. In the many canvases which he produced in this narrow department of genre he showed a keen and strong, but not too florid, power of characterization, which was accompanied with a marvellous technique in the handling of stuffs, metals, etc. But modern history eventually claimed his attention and he found a congenial field for the exercise of his special gifts in the campaigns of Napoleon. His pictures were often small, but finished with minute and delicate virtuosity, a good example of which may be seen in his 'Cuirassiers of 1805'; but he is perhaps less successful in large canvases and elaborate figure compositions than in his small paintings. Among his most famous pictures of the Napoleonic cycle are 'Napoleon I. with his Staff' and 'Napoleon III. at Solferino' (1864); 'Napoleon I. at Friedland' (1875), now in the Metropolitan Museum of New York. In his latter days he painted Venetian scenery and architectural views with his usual dash, thoroughness and originality. In his works he shows the best qualities of the Dutch school with all its life-like expression, truthfulness and spirit combined with the delicacy of French sentiment and abandon. His water colors, etchings and lithographs bear admirable witness to his versatility and vigorous industry. His pictures have always fetched a high price, 'Friedland or 1807' having been sold for \$60,000, a sum scarcely disproportionate to that given for smaller canvases. He is to be looked upon as the founder of the new school of military painters represented by his son Jean Charles Meissonier and Edouard Detaille, his most illustrious pupil. Consult: Claretie, 'Meissonier' (1881); Larroumet, 'Meissonier' (1893).

Meistersingers, mī's'tër-sing'ërz, or **Master-Singers** (German, *Meistersinger*), a society of German singers formed in the 13th century. During the long evenings of winter the worthy burghers of the German cities assembled to read the poems of the minstrels. Some of the hearers were naturally led to try their own skill in verse; others followed, and the spirit of the age soon embodied these votaries of the muse into societies after the fashion of corporations. Charles IV. gave them a charter and a coat of arms. They met on certain days, and criticized each other's productions, in which external correctness seems to have appeared to them the chief object; few, indeed, had an idea of the difference between poetical and prosaic ideas or expressions. Their attempts in the lyric style were chiefly limited to spiritual songs; in the epic to rhymed versions of the scriptural narratives. They were also fond of the didactic style. The rules by which the members of the societies were to be guided as to the metre, etc., of their compositions were written on a table, and called *tabulatur*, for the sake of enforcing a strict observance of purity in language and prosody. The chief faults to be avoided were collected; they were 32 in number, and distinguished by particular names. He who invented a new metre invented also a new tune, the names of which

MEJERDA — MELANCHTHON

were the drollest and sometimes the most senseless imaginable. Besides their stated meetings they held public meetings, generally on Sundays and festivals in the afternoon in churches. In Nuremberg, where the master-singers flourished particularly, such meetings were opened with free singing, in which anybody might sing, though not belonging to the corporation. In this the choice of the subjects was left comparatively uncontrolled; then followed the chief singing, when only those who belonged to the corporation were allowed to sing, and only on scriptural subjects. The judges were called *Merker*, and sat behind a curtain. There were four: one watched whether the song was according to the text of the Bible, which lay open before him; the second whether the prosody was correct; the third criticized the rhymes; the fourth the tunes. Every fault was marked, and he who had fewest received the prize, a chain with medals. Whoever had won a chain was allowed to take apprentices, to have many of whom was a great honor. Money was never taken from apprentices. After the expiration of his poetical apprenticeship the young poet was admitted to the corporation, and declared a master after having sung for some time with acceptance. These strange societies originated toward the end of the 14th century at Mainz, Strasburg, Augsburg, and continued in several free cities of the empire until the 17th, in Nuremberg to the 18th century, where probably the renown of Hans Sachs (q.v.), the famous shoemaker and poet, kept them longer in existence. The last society of the kind was that of Ulm, which was dissolved in 1839.

Mejerda, *mě-yěr'da*, the ancient BAGRADAS, a river of north Africa, formed by the union of several head-streams rising in the Atlas Mountains in Algeria, and flowing through Tunis to its outlet in the Mediterranean, 24 miles north of the city of Tunis. The mass of sediment which it brings down has enlarged its delta and changed the coast line, its mouth formerly being at Bu-Chateur, seven miles southward. Its whole course is about 200 miles.

Mekong, *mă-kōng*, or **Cambo'dia**, a river of Indo-China. See CAMBODIA.

Mela, *mē'lā*, **Pomponius**, a geographer who flourished during the 1st century of the Christian era, probably under the Emperor Claudius. Little more is known of him than that he was a native of Spain, and the author of a treatise in three books in the Latin language, '*De Situ Orbis*,' containing a concise view of the state of the world so far as it was known to the ancient Romans. Mela is edited by Tzschucke (1807), Parthey (1867), and Frick (1880).

Melampus, in Greek mythology, son of Amythaon, who was the first mortal endowed with the gift of prophecy, and who first practised the medical art. He is said to have introduced the worship of Bacchus into Greece.

Melancho'lia. See INSANITY.

Melanchthon, Græcized name of Philipp Schwarzerd (Eng. "black earth"), German reformer: b. Bretten in the Palatinate 16 Feb. 1497; d. Wittenberg 19 April 1560. He was left an orphan in his 10th year and taken into the house of his grandmother, a sister of Reuchlin (see REUCHLIN, JOHANN) the great German humanist, by whom he was affectionately treated

and encouraged in his studies. In his 12th year he entered the University of Heidelberg and two years later was graduated bachelor. While he was occupied as tutor to the son of Count von Löwenstein, he continued to give attention to his own progress in Greek; in 1514 was made master of arts at Tübingen and thenceforth devoted himself to humanism, lecturing on Cicero, Terence and Greek grammar. He also gave much time to the study of theology, jurisprudence and medicine. Here he first became acquainted with Erasmus' edition of the New Testament, and was through the influence of Reuchlin elected professor of Greek in the newly founded University of Wittenberg. He delivered an inaugural address (29 Aug. 1518). '*De Corrigen-dis Adolescentiæ Studiis*,' which produced a revolution in German educational methods and above all met with the approbation of Luther, professor of philosophy at Wittenberg. From this time Melanchthon became '*Preceptor Germaniæ*' (The Schoolmaster of Germany), and the '*Ally of Luther*.' These two champions of the Reformation were brought still closer together by their union at the '*Leipsic Disputation*' (1519) in which they were confronted by Dr. Eck (see ECK, JOHANN VON) the great opponent of Luther and the movement he was inspiring. In his handling of this adversary, both orally and by his writings, Melanchthon showed himself to be the leader of Protestant controversialists and the most learned, judicious and ready of Protestant disputants.

In 1520 he married Katharina Krapp, daughter of the burgomaster of Wittenberg, and "*Master Philip*," as he was familiarly called, as he settled down to domestic life, was placed on the theological faculty of the university, and the first fruit of his increased application to theological study and teaching was his '*Loci Communes Rerum Theologicarum*,' which was the first declaration of the Protestant position delivered in formal terms of dogmatic theology. The volume ran through 60 editions in his life time, and established its author's position as Luther's complement—in some respects the lesser spirit of the Reformation movement, but the scientific talent which supported on the intellectual side the genius and the faith of Luther. Melanchthon, by his historic learning, by his power over the classic languages, was enabled to communicate to the learned world the real principles of the new movement and the facts of the past on which it was founded. He brought to bear his deep knowledge of theological philosophy, his acquaintance with the precise terms in Greek and Latin of scriptural, patristic and scholastic statement on the main question of the dispute, and he had the calmness of the well-balanced humanist which enabled him to direct with cool and even mind the movements of his party and to keep it as free as possible from the fury and blindness of intolerance. His knowledge of Greek made him as useful to Luther in translating the Bible as Parnell was to Pope in the production of his '*Iliad*.' His pen had an immense influence in securing the after success of the initiative taken by bolder but less cautious and reasonable spirits, and left a mark on the German Reformation deeper, more permanent and characteristic than that of any among his most enthusiastic contemporaries. His '*Epitome Doctrinæ Christianæ*' became from the

first an influence which establishes its claim to be called the pandect and code of European Protestantism.

The spirit of Melanchthon was distinctly irenic. The Reformation had resulted not only in a German revolt from the papacy, but in the creation of a host of jarring Protestant sects. Melanchthon's broad and far-seeing spirit was averse to division of any kind. The Augsburg Confession which was presented to the diet in 1530 surprised even the Roman Catholics by its moderate tone. It was drawn up by Melanchthon in accordance with memoranda supplied by Luther and it has all the breadth, calmness and judicial cautiousness of Luther's friend and good genius. But this spirit of compromise, hopefulness and patience was out of harmony with the passion for controversy which made Wittenberg a centre of storm and strife. Melanchthon, however, stuck to his post at Wittenberg long after the great power and influence he once wielded had passed from him, into the hands of more positive, violent and aggressive leaders. There occurred a breach between the Philippists, the followers of Melanchthon and the Lutherans, who adhered to the extreme views of his friend on the subject of free will and irresistible grace, on the doctrine of the Lord's Supper, and on the "adiaphora" indifferent matters, as the former was inclined to term the ceremonies of the Roman Catholic Church. He and his followers were assailed as "rogues" and "worshippers of Baal." Luther stated his own views on the sacrament with such violence that the recollection of his 'Short Confession respecting the Lord's Supper' filled him with remorse on his death bed, where he acknowledged to his friend "Dear Philip, I confess to have gone too far in the affair of the Sacrament." The death of Luther left Melanchthon to the mercy of such zealous and fiery sectaries as had been engendered in that teeming period of intellectual and theological movement, which the monk of Wittenberg had inaugurated. He survived Luther four years, waiting for death, he said "as a refuge from the phrenzy of theologians," and praying that the Protestant world might find its way at last to reunion, a prayer which as yet remains unfulfilled.

Melanchthon's important part in the Reformation movement has often been lost sight of in the blaze of Luther's more striking and popular personality. Yet he may with some reason, be called the brains of the Reformation. More than that, he was a man who, while he stood for progress, was averse to revolutionary change. In one sense he was the Mirabeau of a religious revolution, a constructive rather than a destructive reformer, a man born in a generation, which he could only affect by presenting an example of intellectual refinement, moderation, tolerance and conservation, which the warring giants of the Reformation refused to follow. In 1865 a statue was raised to him at Wittenberg, and in 1883 a group comprising Melanchthon and Luther at Leipsic. His works are found complete in 'Corpus Reformatorum,' 28 vols. (1834-60). Consult: Schmidt, 'Philipp Melanchthons Leben und ausgewählte Schriften' (1861); Richards, 'Philipp Melanchthon' (1898); Neander, 'Vita Quattuor Reformatorum' (1846).

Melanesia, mēl-ā-nē'shī-ā, a collective name for the group of islands in the Pacific

Ocean inhabited by dark-skinned races, as distinguished from the lighter complexioned inhabitants of Micronesia and Polynesia (qq.v.). As such Melanesia comprises the islands stretching from the northeast of New Guinea to the tropic of Capricorn, and include Bismarck Archipelago, the Admiralty Islands, Solomon Islands, Queen Charlotte or Santa Cruz Islands, New Hebrides, New Caledonia, Loyalty Islands, and the Fiji Islands. The Melanesians (Black Islanders) are ethnographically allied to the Negritos more nearly than to the Polynesians, but their dialects are more closely related to the speech of the latter race.

Melane'sians, a collective name given the native inhabitants in the southwestern islands of the Pacific Ocean, including the Fiji Islands, New Caledonia, Solomon Islands, etc. In race and language, as well as in folk-lore and tribal customs, the Melanesians appear to have affinities with the Malays and Polynesians. The people vary in color from dark-brown to black.

Mel'anism, an excess of pigment in the skin and its appendages, producing real or comparative blackness; the opposite of albinism (q.v.). Melanism is less frequent than albinism, but more inclined to affect large numbers of individuals of a species, forming melanistic varieties. A conspicuous example is afforded by the American "black" squirrels, which are melanistic varieties of various species, especially the fox-squirrel (*Sciurus niger*) and the gray squirrel (*S. carolinensis*). These varieties prevail in certain parts of the country, as the region of the Great Lakes and upper Mississippi Valley, and rarely occur elsewhere. Thus a black squirrel is almost unknown in New England or the Hudson Valley. Another familiar example is found in the black leopards, which in a direct light seem absolutely black, but under reflected light betray a pattern of spots similar to those of the ordinary leopard. Such examples, as is the case with other melanistic animals, often occur in the same litter of young with normal forms. In many of the lower animals, as butterflies, melanistic tendencies are developed under certain conditions, especially of excessive moisture. The dark color of the negroid human races is of this nature, and is greatest in those inhabiting warm moist regions. The pigments in the skin are mainly of the class called Melanins, which produce dark hues. Total abnormal melanism in man is unknown, but cases of partial melanism are on record. In one instance one half of the face was white, the other black. The cause of this condition is unknown. Melanoderma, chloasma, and liver-spots are terms applied to irregularly shaped yellow, brown, and black colorations of the skin. Some of these spots are due to scratching following the bites of body-vermin, to prolonged pressure upon a portion of the skin, prolonged use internally of preparations of silver, to racial admixture, general diseases, such as cancer or tuberculosis, etc. See COLORING MATTERS; COLORATION, PROTECTIVE.

Mel'anite (Gr. "black"), a very blackish variety of garnet, especially the lime-iron variety, in which lime largely preponderates in the protoxides. Melanite occupies a place midway between schorlomite and the garnets pure and simple; this is notably true of the sort containing the rare element titanium (q.v.). The group includes all the darkish garnets, with the

MELANORRHŒA — MELBOURNE

exception (made by Dana) of the precious garnet, technically the pyrolite, which varies from red to black. With the green demantoids the blackish melanites make up the greater part of Dana's second class of garnets, the iron garnets. See, also, GARNET.

Melanorrhœa, mel'ā-nō-rē'ā. See VAR-NISH TREE.

Melano'sis. See TUMOR.

Melan'terite (Gr. *μελας* *στέρος*, "black"), in mineralogy, the hydrous sulphate of iron; iron vitriol. It is the native form in which cop-peras occurs, is green in color and has a glassy lustre.

Melas'ma (Gr. "black spot"), a disease marked by discoloration of the skin. The term is rightly used in connection with a pigmentation of the skin, sometimes diffuse (color varying—dusky yellow, greenish brown, or even black), and believed to be dependent upon degeneration of the suprarenal capsules or the semilunar ganglia (see ADDISON'S DISEASE). Sometimes the term is applied to the conditions known as liver-spots and "moth-patches."

Melastoma'ceæ. See DEER GRASS.

Mel'ba, **Nellie**, Australian prima donna: b. Melbourne 19 May 1865. She studied there in the Presbyterian Ladies' College; then took up music under Marchesi in Paris. On 15 Oct. 1887 she made her début in Brussels in 'Rigoletto'; at that time gave up her family name Mitchell and took the stage name Melba, which is said to have been suggested by the name of her native city; in 1889 appeared in Paris at the Opera, where she stayed for three years, during which she appeared in London in Italian repertoire; and after 1892 toured Europe and America. Her best roles are Ophelia, Juliette, Lucia, and Nedda in 'I Pagliacci.' She was married to Charles Armstrong in 1882.

Melbourne, mēl'bērn, **William Lamb**, VISCOUNT. English statesman: b. 15 March 1779; d. 24 Nov. 1848. Carefully trained by his mother, he entered Eton in 1790, Trinity College, Cambridge, in 1796, and Lincoln's Inn in 1797; studied law in Glasgow; was called to the bar in 1804; and in 1805 was elected to the House of Commons, where he followed Fox, leader of the opposition. He lost his seat in 1812 because of his vote for Catholic emancipation; was returned in 1816; served as chief secretary in Ireland in 1827; and in 1828 entered the House of Lords upon his father's death. Only then did he begin to figure in politics, and that only because of his popularity, for he had no official ability, being neither diligent nor brilliant. As home secretary under Grey in 1830 he was a failure; but in July 1834 the king induced him to form a ministry, and again in 1835, in spite of the king's effort to foist Peel on the country in November 1834, he became premier. He remained in office until August 1841, thus covering the early years of the reign of Victoria, whom Melbourne ably instructed in the duties of her position. His tuition of the young queen seems, however, the only event of his long administration, and he must be classed rather as a politician than as a great statesman, since he was scarcely more than indifferent to the reform measures of the day. He was a man of much learning, of a rather attractive, though coarse

and habitually profane, wit, and of a strange admixture of constitutional conservatism and political liberalism. His wife, Lady Caroline Ponsonby, whom he married in 1805, was separated from him in 1825; she wrote several novels and was a friend of Lord Byron. See NORTON, CAROLINE ELIZABETH.

Melbourne, Australia, the capital of the state of Victoria, and the largest city of Australasia, situated around Hobson's Bay, at the northern extremity of Port Phillip, 40 miles north of its entrance from the ocean between Points Lonsdale and Nepean. The city and its numerous suburbs occupy an extensive undulating area, with the Yarra River, a stream of no great size, winding through it. The central and most important business part of the city is on the north bank of the Yarra, two miles by a direct railway line from the river's outlet in Hobson's Bay, but nine miles by the meandering water route. The city is built on a rectangular plan with fine wide streets lined with handsome and substantial public buildings and residences. Numerous lines of railway connect with the interior and the extensive suburban districts, which include such important places as Collingwood, North Melbourne, Fitzroy, Carlton, Brunswick, South Melbourne, Richmond, Prahran, St. Kilda, Port Melbourne, etc. The city is well lighted, and paved, and is abundantly supplied with water, but the drainage, although much has been done toward its improvement, is still defective. Street railways traverse all the principal city and suburban thoroughfares. The public buildings are noteworthy. The Houses of Parliament form a remarkable pile with a splendid west façade. Government House is a palatial building conspicuous from every part of the city, with a tower 145 feet high. Other public buildings include the law courts, forming an extensive square, the post-office, the custom-house, the treasury, the land and mining offices, the mint, the free library with some 300,000 volumes; the university, with an admirable museum belonging to it and a splendid hall (the Wilson Hall) in the Gothic style; the Ormond Presbyterian College; the town hall, with a large assembly room containing a splendid organ; the exchange, atheneum, theatres, etc. The ecclesiastical buildings include an Anglican Cathedral, a Roman Catholic Cathedral; the Scots church, with a fine steeple; and several other fine churches. There are several "sky-scraper" office and store buildings; many banks and business premises are attractive; and the Exhibition building deserves notice. At the head of the educational institutions is Melbourne University, with which are affiliated the three denominational colleges, Trinity (Episcopal), Ormond (Presbyterian), and Queen's (Methodist). Charitable and benevolent institutions are numerous. There are several parks and other grounds for public recreation, and among these the Botanic Garden deserves special notice on account of its extent (100 acres), its beauty, and the value of its collection of trees and plants. The beautiful Fitzroy Gardens also deserve special mention. Melbourne is the see of a Roman Catholic archbishop and of an Anglican bishopric. The United States is represented by a consul-general. The chief industrial products of Melbourne are leather, furniture, clothing, flour, ales, cigars, ironware, woollens, etc. The shipping trade is large both in

exports and imports, the chief of the former being wool and gold, of the latter manufactured goods. Most imports are subject to a heavy duty. There is access to Richmond above the centre of the city for fairly large vessels by the Yarra. Its navigation has been much improved recently and the Coode canal shortens the passage. The largest vessels are accommodated at Port Melbourne and Williamstown, both on Hobson's Bay; Port Phillip Bay affords unlimited anchorage for the largest vessels. Pop. of Melbourne city (1901) 63,380, and including the sixteen suburban municipalities 493,956. The first settlements on the site of Melbourne were made in 1835, and a year or two after it received its present name, being so called after Lord Melbourne, who was then British prime minister. It was incorporated in 1842, and became a bishop's see in 1849. In 1851 it became capital of Victoria (then established as a separate colony), and received an immense impetus from the discovery of gold fields.

A centennial exhibition was held in 1888 in celebration of the founding (in 1788) of the Australian colonies. A great conflict between labor and capital took place in 1890, and a strike by the labor-unionists took place on a very extensive scale both in Victoria and New South Wales. In 1892-3 Melbourne suffered severely from commercial depression, financial crises, and banking disasters. The first Parliament of the Commonwealth of Australia was opened in the Exhibition Building on 9 May 1901, by the Duke of Cornwall and York (now Prince of Wales). Consult: 'Victoria and its Metropolis, Past and Present' (1889).

Melchers, Paulus, German cardinal: b. Munster, Westphalia, 6 Jan. 1813; d. Rome 14 Dec. 1895. He studied law at Bonn, and theology at Munich and Munster; was ordained priest in 1841; in 1857 became bishop of Osnabruck; and in 1865 Pope Pius IX. nominated him archbishop of Cologne. At first opposing the doctrine of papal infallibility at the Vatican Council, Melchers afterward accepted it, in agreement with the majority, and dealt severely with professors who sought to prevent its declaration. In the Kulturkampf (q.v.), his conspicuous activity brought him into collision with the representatives of government, and in 1876 he was removed from his archbishopric. His writings include 'Eine Unterweisung für das heilige Altarsakrament' (1878); 'Die katholische Lehre des Herrn' (1883); and 'Das Leben der allerseiligsten Jungfrau und Gottesmutter' (1884).

Melchites, mēl'kits, those Christians of western Asia and of the Levant who acknowledge the supremacy of the Roman Pontiff, and accept the dogmas of the Roman Catholic Church. The Syriac and Egyptian congregations of this name in the main belong to the Greek Church though in some unimportant matters of ceremony and discipline they take an independent course. They are, however, under a chief bishop of their own, who is styled Patriarch of Antioch. The term Melchites is a nickname. It means "Royalists" and was given to them by the orthodox Greeks with the implication that they accepted the decrees of the Council of Chalcedon merely at the dictation, or in conformity with the example of the emperor. Celibacy is imposed upon their bishops, but their priests are at liberty to marry. Their liturgy is in the Arabic lan-

guage; they use unleavened bread in the Eucharist and in their monastic houses they follow the Basilian rule. Consult Neale, 'History of the Eastern Church.'

Melchizedek, mēl-kiz'ē-dēk ("king of righteousness," that is, righteous king), in the story of Genesis, king of Salem and priest of "Supreme God." He met Abram on his return from the victorious expedition against Chedorlaomer, gave him his blessing, and received tithes from him. The ante-legal king-priest stands in Psalm cx. as a figure typical of the Messiah the vicegerent of Jehovah, and in Hebrews vii. 3, of the kingly priesthood of Jesus. The chapter in Genesis containing his story is a unique passage of the Pentateuch, and according to Wellhausen is one of its latest additions. Ewald counts it the earliest portion of the history, and counts on old Canaanitish records; others, as Nöldeke, explain it as utterly unhistorical.

Melchthal, mēlh'tal, **Arnold von** (ARNOLD AN DER HALDEN), Swiss patriot. He is considered by some authorities to be a mythical character but was supposed to have lived in the 14th century. He incurred the wrath of the governor and was compelled to flee to escape punishment, whereupon the governor seized Arnold's aged father and had his eyes put out. The son, enraged at this barbarity, with two friends planned a revolt against the Austrian power which they successfully conducted. Consult: Ægidius Tschudi, 'Chronicon Helveticum' (1505-72).

Meldom'eter. See MELTING POINT.

Mel'drum, David Storrar, English author: b. Kirkcaldy, Scotland, 29 Aug. 1865. He was educated at the Edinburgh High School, soon after became a journalist, and has been for several years literary adviser to Blackwood & Sons. He has published: 'The Story of Margrède' (1894); 'Gray Mantle and Gold Fringe' (1896); 'Holland and the Hollanders' (1899).

Meleager, mēl-ē-ā'jēr, in Greek mythology, the son of Æneus, king of Calydon. He distinguished himself in the Argonautic expedition and more particularly at the Calydonian hunt, killed the bear and gave its skin to his beloved Atalanta, as a high token of regard.

Melendez Valdes, Juan, hoo-ān' mā'lēn'-dēth val-dās', Don, Spanish poet: b. Ribera del Fresno, Badajoz, 11 March 1754; d. Montpellier, France, 24 May 1817. He studied law at Salamanca, where he attracted attention by his poems in the old ballad manner and was taken up by the poet Cadalso. In 1780 he received the first prize in a competition under the control of the Spanish Academy for his pastoral 'Batilo,' and, in 1784, his comedy, 'Las Bodas de Camacho,' won a prize from the city of Madrid, although unsuccessful on the stage. In Madrid he won the favor of Jovellanos, who appointed him professor of the classics in the University of Salamanca and urged him to enter upon an unfortunate political career; he became judge in 1789, a judicial chancellor at Valladolid in 1791, and fiscal in the supreme court in Madrid in 1797. He suffered brief exile after the fall of Jovellanos (q.v.) in 1798; but in 1802 returned to Salamanca. His sympathy with France, however, made him more than ever unpopular, and after the expulsion of Joseph Bonaparte, he went into exile in France. He

MELETIUS—MÉLINITE

was one of the most prominent figures in Spanish literary life during the 18th century.

Meletius, founder of the sect of Meletians. He was bishop of Lycopolis in the 4th century, and antagonized Peter, patriarch of Alexandria, by refusing absolution and communion to the lapsed, that is, those who under the stress of persecution had renounced their faith. A schism resulted from the dispute and Meletius traveled through Egypt and Syria gathering thousands of followers, until the Council of Nicæa, 325, deprived him of authority and he died soon after, a merely titular bishop. Another Greek ecclesiastic of the same name and century was made bishop of Antioch in 360, when the Arian controversy was at its height there. He tried to reconcile both parties and was accepted by each as an adherent. He suffered banishment more than once, and was quite unsuccessful in healing the schism. He died while presiding over the Council of Constantinople in 381, and was buried with great pomp at Antioch, Gregory of Nyssa preaching his funeral sermon.

Melgarejo, Mariano, mā-rē-ā'nō māl-gā-rā'hō, Bolivian soldier: b. Cochabamba, Bolivia, 18 April 1818; d. Lima, Peru, 23 Nov. 1872. He entered the army at an early age and by his courageous though somewhat unprincipled conduct in the many revolutions in his country, rose to be chief adviser of General Acha in 1862 and was made a general. In 1864 he turned against Acha who was then president, instigated a revolution and seated himself in the presidential chair. During a brief absence of Melgarejo the ex-president Belzu returned and re-instated himself in the presidency only to be shot by Melgarejo himself, who then became dictator. He crushed a revolution in 1866 and in that year formed an alliance with Spain against Peru and Chile. Revolutions followed and he was compelled to flee the country in 1871 and was killed in a quarrel at Lima.

Melikoff. See LORIS-MELIKOFF.

Mellilite, or **Mellilite**, a native silicate of sodium, calcium, magnesium, aluminum and iron, whose formula has not yet been satisfactorily determined. Potassium is also commonly present to some extent. Mellilite crystallizes in the tetragonal system, and has a vitreous or resinous lustre, and usually a honey-yellow color, from which circumstance it derives its name (Greek, "honey"). It is brittle, translucent (at least in thin layers), and distinctly pleochroic. It has a hardness of about 5, and a specific gravity of 3. The mineral occurs in basic eruptive rocks, and is also observed, quite frequently, in the slag from furnaces. It is sometimes called mellite.

Melilot, a genus of annual, biennial and perennial herbs of the natural order *Leguminosæ*. The species, of which there are about a dozen, are natives of western Asia and the Mediterranean region, and have become widely distributed in temperate and sub-tropical climates. They are upright, alfalfa-like plants with small yellow or white flowers which are borne from late spring until frost. The pods are few-seeded and not twisted as in the closely related genus, *Medicago* (q.v.). The two best known species are yellow melilot (*M. officinalis*), an annual, and white melilot (*M. alba*), a perennial, which are common weeds in waste places, the former

especially upon dry, clayey soils, the latter in damp situations. Like other members of the genus they are sweet-scented, particularly while drying, and their flowers are used to some extent for perfumery. White melilot, also known as Bokhara sweet, or tree clover, is cultivated to some extent as bee forage, for fodder, and as a green manure. In the last capacity it is considered specially useful upon clay soils if left for two or three years, because the decay of its long tap roots makes the soil more porous. Cattle relish it in early spring, and after having become accustomed to its hay, which is rather hard to cure owing to its proneness to shed its leaves. Blue melilot (*M. carulea*) is a native of Europe where it is cultivated. By some botanists it is referred to the genus *Trigonella*.

Méline, Félix Jules, fā-lěks zhūl mā-lēn, French politician: b. Remiremont 20 May 1838. He studied law in Paris, wrote for the republican journals under the Empire, and in 1872 was elected deputy from Vosges. In the assembly he was one of the 363. In 1879 he became under-secretary to the ministry of justice and about the same time a disciple of protectionism; in 1892 he completed his tariff programme by passing the protective measure of that year. In the interval he had been minister of agriculture (1883-5), and president of the Chamber (1885-9), a post to which he was again chosen in 1894. From April 1896 to June 1898 he was prime minister with the portfolio of agriculture, keeping in power so long by a combination of the Moderate Left with certain factions of the Right. During his ministry the motion to revise the Dreyfus case came up, but was opposed by Méline. He is now the head of the Progressists, the old Left Centre and Opportunist parties.

Mélinite, mā'līn-īt, an explosive employed by the French government in charging torpedo shells and in the preparation of rupturing charges for the use of the engineer corps and cavalry in effecting demolitions. As originally used it was composed of 70 per cent of picric acid mixed with 30 per cent of pyroxylin dissolved in 45 parts of acetone. As now used, either alone, or with cresylite, it consists exclusively of fused picric acid which is poured into the shell when in the molten condition and is cast there in such a manner as to leave a central canal in the mass in which the fuse, terminating in a mercuric fulminate detonator by which the charged is fired, may be contained. By the use of this fuse the detonation of the charge is delayed sufficiently to allow the shell to penetrate armor and reach the farther side of it before the charge explodes. Mélinite was very thoroughly tested at Bouchet in 1892 to determine the degree of safety that it possesses when exposed to shocks, fire and the accidental rupture of receptacles containing it, and the results were most favorable. Yet there have been several very serious accidental explosions with it which have been attributed to the formation of sensitive picrates through reaction of the charge with foreign bodies in the shell. The explosion of mélinite is not a complete one, since the gaseous product contains considerable quantities of carbon monoxide which is readily combustible. It is also very poisonous. This explosive owes its name to the yellow color, which is one of its chief characteristics.

MELIORISM — MELLO

Meliorism. See PROGRESS.

Melis'sa, a plant. See BALM.

Melissus, mē'līs-ūs, Greek philosopher: b. Samos, about 480 B.C. He was the son of Ithagenes, and is said to have been a friend of Heraclitus, and to have commanded the fleet opposed to Pericles in 440 B.C. in the Samian war. Some fragments of a prose work of his, written in the Ionic dialect, have come down, and have been collected and published by Brandis and by Mullach (1846). From these he appears to have been a philosopher of the Eleatic school, and to have reached more definiteness and consistency than Parmenides.

Melita, mē'lī-tā, the island on which Saint Paul, on his voyage to Rome, was cast away. This has generally been considered to be the Island of Malta, the ancient name of which was Melita, and one of whose bays has from immemorial time borne the name of St. Paul; but some critics have attempted to prove that it was an island (the modern *Meleda*) on the coast of Salmatia, in the Adriatic.

Mel'itose. See RAFFINOSE.

Melkart (Phœnician, "God of the City"), name of the presiding deity of the city of Tyre, and of the whole Tyrian nation, namely Baal (q.v.), the sun god. He is sometimes identified with the Heracles or Hercules of the Greeks. He was the patron god of mariners, and the Phœnician colonies of the West, in Africa and Spain were under his protection. To him has been ascribed the subjugation of the savage races who anciently peopled these regions and the building of early Phœnician towns. The institution of order and legislation in these cities was also said to have been his work. Many are the voyages which he is related to have made. One of his exploits was the rescue of Astarte from the darkness in which the moon had imprisoned her in the west; he afterward made her his wife. For an account of the Temples of Melkart at Tyre consult Jeremias, 'Tyrus bis zur Zeit Nebukadnezars' (1891).

Mel'kites. See MELCHITES.

Mell, Patrick Hues, American educator: b. Waltheurville, Ga., 19 July 1814; d. Athens, Ga., 26 Jan. 1888. He was educated at Amherst and after teaching for several years was appointed professor of ancient languages at Mercer University in 1842 and was also ordained a Baptist minister in that year. In 1856 he was appointed to the same chair in the University of Georgia, and in 1870 he became vice-chancellor, which post he resigned in 1872. In 1878 he was appointed chancellor, and in 1880 was elected to the chair of metaphysics and ethics, which offices he occupied at his death. He held several pastoral charges and was president of different conventions in addition to his educational work and published: 'Baptism' (1852); 'Parliamentary Practice' (1868); 'Church Polity' (1878).

Mell, Patrick Hues, American scientist: b. Penfield, Ga., 24 May 1850. He was a son of the preceding, was graduated at the University of Georgia in 1871 and was State chemist in 1874-7. In 1878 he was called to the chair of geology and botany at the Alabama Polytechnic Institute and continued in that position until 1902, when he accepted the presidency of the South Carolina Agricultural and Mechanical College. In addition to his work in the universities he was con-

nected in 1884-1902 with the Alabama Weather Bureau and the Agricultural Experiment Station and he invented a system of weather bureau signals which has been adopted by the United States Weather Bureau. He is a member of various historical and scientific societies and has published: 'Southern Soapstones and Fire-clays' (1882); 'Study of Cotton Plant' (1890); 'Life of Patrick Hues Mell, Sr.' (1895); 'Biological Laboratory Methods' (1902); etc.

Mellen, mē'l'en, **Grenville**, American poet: b. Biddeford, Maine, 19 June 1799; d. New York 5 Sept. 1841. The eldest son of an eminent chief justice of Maine, he was graduated at Harvard College in 1818, studied law with his father in Portland, was admitted to the bar, and in 1823 he engaged in the practice of his profession. In 1829 he collected from his prose contributions to periodicals a volume entitled 'Glad Tales and Sad Tales.' His principal collection of poems, entitled 'The Martyr's Triumph, Buried Valley, and Other Poems,' was published in 1833. The 'Martyr's Triumph' is in the Spenserian stanza, and is founded on the history of St. Alban; the 'Buried Valley' describes the avalanche near the notch in the White Mountains by which the Willey family was destroyed. His verse is pleasing, but in general shows promise rather than performance.

Mel'illite. See MELILITE.

Mellit'ic Acid, **Mellic Acid**, or **Benzene Hexa-carboxylic Acid**, an organic acid having the formula $C_{12}H_6O_{12}$, or $C_6(COOH)_6$. It may be prepared by oxidizing charcoal with potassium permanganate, $KMnO_4$; but it is best obtained from its aluminum salt, which occurs native as the mineral melilite (q.v.). The pulverized melilite is boiled with ammonium carbonate, ammonia is added to throw down the aluminum, and the filtrate is evaporated until the ammonium salt of the acid separates out. This is re-dissolved, precipitated by lead acetate, and the precipitated mellate of lead is decomposed with sulphuretted hydrogen gas, which liberates the acid in the free state. Mellitic acid is readily soluble in alcohol and in water, and from its alcoholic solution it crystallizes in the form of silky needles. Heat decomposes it, with liberation of carbon dioxide, and the formation of a new substance, $C_{10}H_6O_{10}$, known as "pyro-mellitic acid." Numerous salts of mellitic acid (known as "mellates") have been prepared, but neither the acid nor its compounds are of any special industrial or scientific importance.

Mello, **Custodio José de**, koos-tō'dē-ō hō-sā' dā mās'tō, Brazilian admiral: b. about 1845; d. 16 March 1902. In 1889 he took a prominent part in the revolution, was promoted to be admiral, and was appointed minister of the navy. Four years later he formed a plot in behalf of the Federal party and the navy, against the party of the army and its candidate for reelection, President Peixoto; bombarded and blockaded Rio de Janeiro; and, when forced out of the harbor by vessels of foreign navies, notably American, occupied Rio Grande do Sul. He could not agree with his lieutenant, Saraiva, however, and so surrendered to the government of Argentina. In 1901 he was accused, in spite of his former republicanism, of plotting to establish an empire, and was interned upon the island of Cobras.

MELLONI — MELODY

Melloni, Macedonio, mā-chā-dō'nē-ō mēl-lō'nē, Italian physicist: b. Parma 11 April 1798; d. Portici, near Naples, 11 Aug. 1854. He first became professor of natural philosophy at the University of Parma, where between 1824 and 1831 he taught hygrometry. Political events having compelled him in the latter year to expatriate himself, he went to Geneva, where he made several important discoveries respecting the radiation of heat, which he presented in 1833 to the French Academy of Sciences. Later discoveries won him the Rumford medal from the Royal Society of London. Through the influence of his friends Arago and Humboldt, he was enabled to return to Italy, and was appointed by the king of Naples director of the meteorological observatory on Mount Vesuvius. Among the results of his labors at this institution was the discovery of heat in lunar light, which led to the determination of the analogy of radiant heat to light. Political troubles again interrupted his labors, and for his presumed sympathy with liberal principles he was in 1849 ejected from his post. In 1850 he published the first volume of a work entitled 'La termocrazi, o la colorazione calorifica,' containing an account of his theory of the "coloration of light," and of his experiments on the diffusion of heat by radiation, and particularly of its transmission through transparent media. Subsequently he gave much attention to the study of electricity, and combated the conclusions of Faraday with regard to the transmission of currents over submarine wires.

Melocactus, a cactus typical of the tropical American melon-cactus, family *Melocactidae*. It consists of a globose or conical stem, having rows of spores at intervals and flowers at the top on a hemispherical or cylindrical head. *M. communis* of the West Indies is the Turk's, Englishman's, or Pope's-head cactus. The head bearing the flower is red, and like a Turkish fez in form.

Melodeon, a musical wind instrument with a row of reeds and operated by keys. The rocking melodeon, known in America since about 1825, was unsightly, tardy in sounding, and of harsh tone. Jeremiah Carhart in 1815 conceived the plan of acting on the reeds by suction instead of blowing, and reversed, to this end, the bellows and reeds, inventing the present instrument in 1836. He thus secured prompt sounding, and a flute-like quality of tone; "voiced" the note by curving the reeds; and made many other improvements. In a single year 22,000 of these instruments have been manufactured in the United States, although there is no longer any great demand for them.

Melodrama (from the Greek *melos*, song, and *drama*, action), originally and properly a half-musical drama, or that species of drama in which the declamation of certain passages is interrupted by music. It is usually a tragedy of common life, filled with surprises, acts of violence, and all that excites and sustains the attention of the audience, mixed up with dancing and music, and sometimes with scenes of a rudely comic character. Probability is freely sacrificed for the sake of striking situations. See **DRAMA**, THE.

Melody, in music, a succession of single tones so arranged as to express a musical thought. A solo for one instrument or voice

with or without accompaniment is the most typical example of a melody. A curious exception exists in a song with piano accompaniment by Peter Cornelius called 'Ein Ton' (Monotone) in which the voice part consists throughout of but one note repeated many times. Here the slight suggestion of melody that exists is entirely in the accompaniment.

Melody is one of the most comprehensive terms used in music, being properly applicable to as few as two notes or to as many as the entire principal vocal or instrumental part of a composition. An example of the first is the motif of woe in Wagner's 'Der Ring des Nibelungs.'

Examples of the latter are too numerous to require mention.

The term is also appropriately applied to a phrase or portion of a phrase in a part that has been subordinate to the principal one and which for a moment gains importance on account of its greater melodic significance. In concerted music, vocal or instrumental the highest part is usually the melody, though as stated above an inner one may temporarily assume it. In polyphonic music all the parts are equally melodic.

Melody is the outgrowth of the improvised recitatif. The early Greek singer standing before his audiences holding his four-stringed lyre or chelys, *χέλυσ*, plucked a string and recited his poem on that note until fancy impelled him to change it. From this crude ancestor has sprung melody as we understand it to-day, which with rhythm and harmony form the great trinity necessary for the complete expression of music. Melody is the only one of the three capable of suggesting enough of the other two to be satisfactory by itself. The folk-song of old and the popular song of to-day may be sung by a single voice without any accompaniment

"Also sprach Zarathustra"—Richard Strauss.

and yet convey a very definite idea of the rhythm and something of the harmony that would naturally accompany the tune. Such a performance is, of course, incomplete and only effective in music of the simplest character. Yet it conveys much more than the mere rhythm of the tune played on a drum would give and still more than the mere harmony played without either the melody or the rhythm. It is curious that the Greeks with all their extraordinary achievements in all other forms of art should have advanced so little in music. No doubt they used music in their religious feasts and the cross flutes *παραλαύς* and lyres supplied what they must have thought melody, but they do not seem to have ever dreamed of musical accent or rhythm, without which we cannot to-day call a succession of sounds melody, while harmony was unthought of for many centuries.

Melody is greatly affected by the harmony that the composer has wedded to it, and it is to this fact perhaps more than any other that originality continues possible, for with but twelve

MELOIDÆ—MELONS

different notes from which to form a melody it is evident that even with all the variations that rhythm can add the melodic material is capable of exhaustion in the enormous and growing number of compositions. The following phrases of melody, especially the first, have no particular suggestion played alone:

but with the harmony that the composers have added they have an entirely different signifi-

cance, the one of great solemnity and foreboding, the other of harsh cynicism and sneering.

HENRY GORDON THUNDER,
Conductor Choral Society of Philadelphia.

Melo'idæ. See BLISTER-BEETLE.

Melon-cactus, or **Melon-thistle.** See MELOCACTUS.

Melon-pear, or **Shrub.** See MELONS.

Melons, a popular name for several unrelated plants, but more particularly for two members of the order *Cucurbitaceæ*, the muskmelon (*Cucumis melo*) and the watermelon (*Citrullus vulgaris*). The more important other fruits similarly known are the Chinese preserving melon (*Benincasa cerifera*) of the same order; the melon papaw (*Carica papaya*) of the order *Passifloraceæ*; and the melon-shrub or melon-pear (*Solanum muricatum*) of the natural order *Solanaceæ*.

The muskmelon is an annual trailing herb which has been introduced by man into all tropical, sub-tropical and many temperate climates from southern Asia where it is native. It is characterized by long, running, hairy and somewhat prickly vines, roundish heart-shaped leaves, yellow monoecious flowers, and usually edible fruits of very various forms and sizes. The following are the principal botanical varieties or sub-species: Variety *cantaloupenis*, the cantaloupes, or rockmelons, which have hard, warty, or scaly rinds more or less furrowed, and flesh of various colors from white to red, green or yellow. In the United States the name "cantaloupe" is loosely applied to horticultural varieties of other groups. Variety *reticulatus* includes the nutmeg or netted melons which have softer rinds, sometimes smooth but usually more or less netted. To this group belong the larger part of the so-called cantaloupes in American markets. Variety *sacharinus* comprises the pineapple-melons which have very sweet flesh but are not clearly distinct from the preceding group. Variety *inodorus*, the winter muskmelons, which have less hairy, lighter-colored vines and foliage, and whose long-keeping fruits are deficient or entirely lack the characteristic musk-melon odor. This group is less cultivated in the United States than in the Mediterranean region; but be-

cause the fruits can be kept until Christmas or later when properly grown, gathered before frost, and slowly ripened in a cool, rather dry room, they should become more widely popular where the seasons are long enough to permit their reaching such a stage of maturity. Variety *flexuosus*, the snake-melons or cucumbers, have very long, narrow, greenish, contorted fruits, prized more as oddities than for economic uses, though often used for making preserves. They are distinct from the snake-gourds which belong to the genus *Lagenaria*. A variety *chito*, called orange-melon, melon-apple, garden-lemon and many other popular names, bears orange- or lemon-like almost scentless fruits with white or pale yellow flesh, which is grown to some extent for preserving. Variety *dudaim*, the pomegranate-melon, Queen Anne's pocket-melon, dudaim melon, etc., has small brown and yellow fruits valued solely for their exquisite perfume.

Melons are propagated wholly by means of seeds, which may be sown directly in the field or started under glass upon inverted sods, in flower-pots, berry-boxes, etc., and transplanted to the field as soon as danger of frost has passed. The former method is practised most extensively in the South, and in other warm climates where the seasons are long; the latter in the North because the shortness of the season demands that the plants obtain an early start. The soil best suited to melons is a light sandy loam well drained, well exposed to the sun and well supplied with plant-food. It should be deeply plowed, thoroughly harrowed and kept clean of weeds, especially before the plants are set and until the vines cover the ground. After harrowing, the ground is marked in checks about five feet square, and ten or twelve seeds, or five or six plants, are set in each "hill," from which all but the two or three strongest vines are removed after the insects have had their share. Often, especially upon rather poor or tenacious soils, two or three shovelfuls of well rotted manure is mixed with the earth of the hills to give the plants a little impetus. The fruits are gathered when they will readily separate from the stems, preferably in the early morning.

During the closing decade of the 19th century the demand for highly flavored melons was greatly increased by the appearance in the eastern markets of the Rockyford melon, a small fruit grown in Colorado. Its appearance in large quantities drew public attention to numerous other high flavored melons grown in other sections. As a consequence, many inferior varieties have nearly disappeared from cultivation. With the exception of the Colorado melon fields there is no extensive exporting region in the United States devoted to this crop, the crop of each Southern State being mainly consumed in local markets. New Jersey, Maryland and Delaware produce immense quantities, the first-mentioned State especially; and the product is consumed largely in the cities of Pennsylvania and New York. The Mississippi Valley States also send considerable quantities to northern markets.

The watermelon is an annual trailing herb, a native of tropical and southern Africa, whence it has been introduced by man into all tropical, sub-tropical and many temperate climates for its watery sweet fruits, which sometimes weigh more than 75 pounds, but usually range between 20 and 50 pounds. The vines are more hairy, lighter green, longer running than those of the

MELOPIANO — MELROSE

muskmelon and the leaves are deeply notched, in some cases approaching the compound form. Except for a horticultural group of firm-fleshed varieties known as preserving watermelons or more popularly as citrons, the watermelon seems to have no varieties worthy the name of subspecies or botanical varieties, and even this group appears not to have received such designation.

In general, the watermelon requires the same treatment as the muskmelon, the soil being, if anything, lighter and more sandy, and the distances between hills about double, except for the smaller growing sorts. The principal producing regions are Georgia and Colorado, but the watermelon is grown largely in all the Southern States, and some of the short-season varieties as far north as Michigan and Ontario. The watermelon has much better shipping qualities than the muskmelon, since the tough-rinded kinds may be placed in cars two or more feet deep, the smaller specimens upon the bottom, and shipped long distances. Muskmelons, being more delicate, must be barreled or crated. The fruits are used exclusively in the raw state, and have no by-products such as vinegar, sugar, syrup or brandy. The rinds, however, when deprived of the hard exterior, are often preserved with raisins, etc.

Both muskmelons and watermelons are subject to the attacks of several insects, among which the small, black, striped cucumber-beetle (*Diabrotica vittata*), the squash vine-borer (*Melipotis ceto*), the melon-caterpillar (*Margarotia hyalinata*), the cucumber flea-beetle (*Crepidodera cucumeris*), the squash-bug (*Anasa tristis*), and the melon-louse (*Aphis gossypii*) are the most important. Tobacco dust and plant protectors are largely used to prevent the attacks of the first, the adults of which feed upon the under sides of the leaves and the larvæ upon the roots. The melon-louse is fought with kerosene emulsion sprayed upon the under sides of the leaves, or by fumigation with carbon disulphide. No effective remedy has been suggested for the borer. Arsenical sprays have been recommended for the caterpillars and other chewing insects. Since the insects are believed to spread diseases from plant to plant, melon-growers seek to prevent insect injury as far as possible and practicable. The diseases, of which a large number have been described, are much the same as attack cucumbers, and may be similarly controlled where control has been found possible. Some diseases, as wilt, have defied all tried remedies. This disease generally ruins the vines a week or ten days before the fruits would be ready to harvest. Many of the complaints as to the poor quality of eastern-grown muskmelons result from the sale of melons that have been gathered from blighted fields.

Consult: Bailey, 'Cyclopedia of American Horticulture,' New York, 1900-2.

M. G. KAINS,
Crop Expert.

Mel'opian'o, an invention by which sustained sounds can be produced on a pianoforte. It consists of a series of small hammers set into very rapid vibration by the winding up of a spring. See MUSICAL INSTRUMENTS, MECHANICAL.

Melos, mē'lōs, Milo, or Milos, Greece, an island in the Ægean Sea, the westernmost of the Cyclades, about 65 miles east of the Morea. Its

length, east to west, is about 14 miles, and it is about eight miles in extreme breadth; area, 64 square miles. It is mountainous, of volcanic formation, has hot mineral springs, and mines of sulphur. The island was once famous for its riches, fertility, and population, and corn, wine, cotton, oranges, and other fruits are still grown. Sulphur, manganese ore, millstone, gypsum, etc., are exported. Kastron is a large village on the north coast. The island of Melos was first colonized by Phœnicians, and afterward by Dorians. During the Peloponnesian war it was the faithful ally of Sparta till 416 B.C., when it was taken by the Athenians and its inhabitants massacred or sold as slaves. From 1204 till 1537 it formed part of the Venetian duchy of the archipelago. At the latter date it was taken by the Turks, with whom it remained till the epoch of Greek independence. In 1820 a peasant discovered here the celebrated statue known as the Venus of Milo, now placed in the Louvre at Paris; the Poseidon in the National Museum at Athens was also discovered here. There are numerous interesting archaeological remains, chief of which are those of the Hall of the Mystæ on the site of the ancient capital near the village of Klima, and those of prehistoric Phylakopi, which were excavated by the British School at Athens from 1896 to 1899.

Melpomene, mēl-pōm'ē-nē, one of the Muses, daughter of Zeus and Mnemosyne. She presided over tragedy, and was generally represented as a young woman with vine leaves surrounding her head, and a tragic mask covering her face.

Mel'rose, Mass., city, in Middlesex County; on the Boston & Maine railroad; about eight miles north of Boston. It was settled about 1632, and until 1649 it was a part of Charlestown. It remained a part of Malden until the next year (1650), when it became a separate municipality. It was chartered as a city in 1900 and includes the villages of Fells, Wyoming, and Melrose Highlands. It is a residential suburb of Boston, but has considerable manufacturing. The chief manufactures are rubber boots and shoes. The State Reservation, Middlesex Fells, 1,800 acres, and Spot Pond, a natural reservoir, are attractive features. The government is vested in a mayor, elected annually, and a council. The subordinate officials are chosen by the mayor and council; the school board are chosen by popular election. Pop. (1800) 8,519; (1900) 12,962. Consult: Drake, 'History of Middlesex County.'

Melrose, Scotland, a village of Roxburghshire, on the Tweed at the base of the Eldon Hills, three miles north of Abbotsford, the home of Sir Walter Scott, whose 'Lay of the Last Minstrel' gave Melrose and its ruined abbey world-wide celebrity. The village in 1901 had a population of 2,195. The famous abbey, now the property of the Buccleuch family, is admitted to be the most beautiful of all the ecclesiastical ruins in Scotland. The architecture is in the late flamboyant Gothic style, and the chief remains are part of the nave, the transept, choir, and the southern aisle with several chapels, of the abbey church, and fragments of the cloister. The church originally was 258 feet long, with a width at the transepts of 137 feet. It was founded by King David I. in 1136; destroyed by Edward II. in 1322, and rebuilt by Bruce in

MELTING POINT—MELUSINA

1326. It was partly demolished by the English in 1545.

Melting Point, the temperature at which the solid and liquid states of a body can coexist, without the fluid part of the mixture solidifying, nor the solid part melting. The melting point of a body which is crystalline in nature (like ice) is usually quite definite, and a body of this kind, when it melts, passes at once from a state of perfect solidity into a state of perfect fluidity. The melting point of an amorphous body, such as wax or pitch, is often very indefinite; and when a solid of this sort is gradually heated it grows soft and passes into the fluid state by a process which is practically (or even absolutely) continuous. The phenomena of the fusion and solidification of amorphous bodies like wax are not yet understood as well as those that attend the change of state of a crystalline body; and it is to be understood that what follows in the present article is stated with particular reference to the crystalline class of substances, in which the melting point is definite.

In general, solid bodies expand upon melting, the original solid having a greater density than the liquid that results from its fusion. In the case of water, as is well known, the reverse is true; the fact that ice floats in water proving that the water is denser. The fact that the density of a substance changes upon fusion implies (as may be proved by the mechanical theory of heat) that the melting point of the substance cannot be entirely independent of the pressure. This fact was first discovered in 1849 by James Thomson, who showed that the melting point of a substance like ice, which contracts upon melting, must be lowered by pressure; while the melting point of one which expands upon melting must be raised by pressure. These theoretical conclusions have since been abundantly verified by experiment. In the case of ice, for example, it has been found, by Dewar, that the melting point is lowered by 0.0130° F. per atmosphere of increase of pressure, up to 700 atmospheres.

When a substance passes from the solid to the liquid state, it absorbs a very considerable amount of heat, which is known as the "latent heat of liquefaction"; and the liquid which is formed cannot be all reduced to the solid state again until an exactly equal quantity of heat has been abstracted from it. When heat is added to a mixture composed of a solid and its liquid (pounded ice and water, for example), it does not increase the temperature of the mixture, but merely causes a certain amount of the solid to melt. This continues so long as any of the unmelted solid remains; each addition of heat merely bringing about a corresponding amount of liquefaction, while the temperature of the mixture remains unchanged. It is only after all of the solid has melted that the further addition of heat will produce elevation of temperature. The melting points of compounds undoubtedly depend, in some manner, upon their molecular constitutions, but we have, as yet, no definite knowledge of the nature of the dependence. We know that in a homologous series of organic compounds, the melting points show a strong tendency to increase, as the molecular weights of the members of the series increase; but the change in the melting points is irregular as we proceed from member to member, and no law

has yet been discovered which takes the changes fully into account. The melting point of a mixture (such as an alloy) is often lower than that of any one of the constituents, and the effect of the presence of an impurity in a given substance upon the melting point of that substance is often out of all apparent proportion to the quantity of impurity present. This fact implies that in the determination of a melting point it is highly important that the substance under examination shall be as nearly pure as possible. The presence of slight, unrecognized, and apparently negligible impurities has sometimes led to entirely erroneous conclusions. In 1860, for example, Kolbe announced the discovery of an acid isomeric with benzoic acid, but having a lower melting point; but Beilstein afterward proved that the substance in question was merely ordinary benzoic acid contaminated with a quantity of chlorobenzoic acid so small as to be barely recognizable by analysis.

For determining the melting point of minerals, the instrument devised by Joly, and known as the *meldometer*, is sometimes very convenient. It consists essentially of a strip of platinum foil, upon which small fragments of the mineral are laid. The platinum is then gradually heated by the passage of an electric current, until the mineral melts; the temperature of the foil being obtained by a calculation based upon the resistance of the platinum, the observed strength of the current, and the rate at which heat is radiated from the foil, as determined by separate observations. This method is especially useful for minerals which can be had only in small fragments.

Mel'ton Mowbray, mō'brē, England, an ancient market town in Leicestershire, 14 miles northeast of Leicester, on the right bank of the Wreak, at the junction of the Eye. Melton Mowbray is famous for its pork-pies, five tons a week being exported, and is also celebrated for Stilton cheese. Melton Mowbray, however, owes its prosperity chiefly to being the seat of the Melton Hunt, which attracts the sporting world in great numbers during the winter months, extensive and luxurious hunting establishments being maintained here. Pop. (1901) 7,454.

Melt'zer, Charles Henry, American playwright and journalist: b. London, England, 7 June 1853. He was educated in Paris, where he became correspondent of the *Chicago Tribune* and later of the *New York Herald*, for which paper he traveled over Europe and Egypt. In 1888 he was appointed dramatic critic of the *New York Herald*, holding that position for four seasons. From 1893 to 1896 he was dramatic reviewer of the *New York World*. His experience was utilized as literary associate in connection with a course of modern plays at Carnegie Lyceum, New York, and in Washington, Boston, and elsewhere. Among his plays are: 'The Story of Rodion the Student,' and English versions of 'Hannele' (Hauptmann), 'Mme. Sans Gêne' (Sardou and Moreau), 'L'Arlesienne' (Daudet), 'The Sunken Bell' (Hauptmann); and a farce, 'His Honor the Mayor' (with A. E. Lancaster).

Melusina, mēl-oo-sī'nā, in French superstition, a beautiful nymph or fairy, who is represented as the daughter of Helmas, king of Albania, and the fairy Persine; and as having married Raymond, Count of Toulouse, who built the

MELVILLE—MELVILLE SOUND

magnificent castle of Lusignan. Like most of the fairies of that period, she was doomed to a periodical metamorphosis, during which the lower part of her body assumed the form of a fish or a serpent. On these occasions she exerted all her ingenuity to escape observation; but having been once accidentally seen by her husband in this condition, she swooned away, and soon afterward disappeared. Her form is said to be seen from time to time on the tower of Lusignan, clad in mourning and uttering deep lamentations. Her appearance was believed to indicate an impending calamity to the royal family.

Melville, mēl'vīl, or Melvill, Andrew, Scottish reformer: b. Baldovie, near Montrose, Forfarshire, 1 Aug. 1545; d. 1622. He was educated at the grammar school of Montrose and the University of Saint Andrews; studied two years (1564-6) at the University of Paris; went to Poitiers to pursue his studies in the law; there became regent in the College of Saint Marceon; and through the influence of Beza received an appointment to the chair of humanity in the academy at Geneva. Returning to Scotland in 1574, he was at once appointed principal of the University of Glasgow, and in 1580 was made principal of Saint Mary's College, Saint Andrews. In 1582 he presented a petition to King James against the undue interference of the court in ecclesiastical affairs, for which he escaped imprisonment by going into England. Returning in 1585, he resumed his duties at St. Andrews, and was moderator of the General Assembly in 1587, 1589, 1594. In 1606 he was summoned to London by the king to confer on church matters, but because of his outspokenness he was committed to the Tower, and there remained until 1611. He was then released upon the solicitation of the Duke of Bouillon, retired to France, and became professor in the university at Sedan, which, according to some accounts (others say London), was the place of his death. Consult 'Lives' by McCrie (1819); Morrison (1900).

Melville, Sir George, British administrator: b. Aberdeen, Scotland, 1 July 1842. He was educated by private tutors and at Edinburgh Academy. By competitive examination he entered the imperial service in 1862; was transferred to the colonial civil service in 1874, and appointed treasurer of Sierra Leone, the next year acting also as colonial secretary of that colony. In 1879 he was made assistant government secretary of British Guiana; in 1889 was appointed colonial secretary of British Honduras, and during the next two years administered the government, for which he was decorated. The government of the Falkland Islands was administered by him in 1893, that of the Bahamas in 1894-5, and that of the Leeward Islands from 1895 to 1901.

Melville, George Wallace, American naval engineer: b. New York city 10 Jan. 1841. He was educated at the Brooklyn Polytechnic Institute; entered the navy as assistant engineer in 1861; served through the War; and in 1879 accompanied the De Long expedition on the *Jeannette* to discover the northeast passage. Of this party he was one of the few survivors; most of the others owed their lives to his indomitable courage and herculean strength—he carried a brother officer, weighing 175 pounds, upon his back, through ice and snow, at the same time

superintending all movements of the crew and on occasion helping with the boat. He also commanded the subsequent search expeditions which recovered the *Jeannette's* records and De Long's body. In 1887 he was made chief engineer of the navy, a post from which he retired in August 1903, having entirely reformed the service, put navy engineers on a professional rather than an artisan footing, introduced the triple screw on such successful ships as the *Columbia* and *Minneapolis*, saved the department a tremendous sum by his refusal to adopt a boiler which had proved unsatisfactory in the British navy, and designed 120 ships of over 700,000 horse-power. Melville was made rear-admiral in 1899. His book, 'In the *Lena Delta*' (1885), describes his experiences in the *Jeannette* expedition.

Melville, Herman, American naval novelist: b. New York 1 Aug. 1819; d. there 28 Sept. 1891. His grandfather was the original of Holmes' 'Last Leaf.' His father, an importing merchant, died when Herman was a boy, and in 1837 his education in the Albany Classical School and in New York city having been completed, he shipped as a cabin boy. Then he taught school for several years, but in 1841 sailed on a New Bedford whaler, from which in 1842 he made his escape with a comrade on one of the *Marquesas*. His experiences among the warlike natives and his rescue by an Australian whaler are described in 'Typee, a Peep at Polynesian Life' (1846), a great success and an excellent portrayal of life in the South Seas. In 1847 he married the daughter of Justice Lemuel Shaw of Massachusetts; from 1850 to 1863 lived in Pittsfield; was employed in the New York custom-house from 1866 to 1885; and then retired because of ill-health. Melville's writings apart from a few small volumes of verse are mostly taken up with the life of the sailor; some of his better known titles are: 'Omoo, Adventures in the South Seas' (1847); 'White Jacket, or the World in a Man-of-War' (1850), which effected the abolition of flogging in the United States navy; 'Moby Dick, or the White Whale' (1851); and 'Pierre, or the Ambiguities' (1852). These stories were justly popular and are highly praised by W. Clark Russell (q.v.). Several "philosophical romances" met with little success. 'Battle Pieces, and Aspects of the War' (1866) is Melville's best verse. His four best romances of the sea were re-edited in 1892.

Melville Island, (1) an island of the Arctic regions crossed by lat. 75° N., lon. 110° W., and separated on the west by Fitzwilliam Strait from Prince Patrick Island. Its greatest length is 200 miles; greatest breadth 130 miles. It was discovered in 1819 by Parry, who gave the island its name and wintered there; (2) an island at the entrance to Van Diemen Gulf, off the shore of the north territory of South Australia, with an area of about 1,800 square miles. It is hilly and densely wooded, especially with several species of eucalyptus. The earliest British settlement was made in 1824.

Melville Peninsula, North America, a northeastern projection of Keewatin, bounded on the north by Fury and Hecla Strait, and on the east by Fox Channel. It is about 250 miles long by about 100 miles broad.

Melville Sound, North America, a channel about 250 miles long by 200 miles broad, extend-

MEMBRANE — MEMNON

ing southeast of Melville Island, and communicating with the Arctic Ocean on the west by Banks' Strait, and with Baffin Bay on the east by Barrow Strait and Lancaster Sound.

Mem'brane, in anatomy and physiology, a thin sheet-like tissue, more or less elastic, varying in structure and vital properties. Membranes absorb or secrete fluids, connect certain parts of the body, separate, envelop, or form certain organs, or act as partitions between two fluids or gases, permitting them to mingle. Mucous membranes line the canals, cavities, and hollow organs which communicate externally by different apertures on the skin; for example, the digestive, respiratory, and genito-urinary tracts. These membranes are soft and velvety, and have on their free surface cells for absorption or motion, and in their substance follicles which secrete mucus for lubricating purposes. Serous membranes, such as the peritoneum, pleura, and pericardium, facilitate the motion of the organs they envelop (abdominal digestive organs, the lungs and heart) by reason of the serum they secrete, and also maintain the shape of these organs. Allied to the serous membranes are the synovial membranes lining movable joints. By reason of their smoothness and by the aid of their lubricating serum the ends of bones move readily upon one another. Fibrous membranes (for example, periosteum, dura mater, and perimyrium), not moistened by any particular fluid, augment the solidity of organs they envelop, retain them in position, favor their motion, and form canals and rings for the passage of different organs.

Membré, mōn-brā, **Zenobius**, French missionary in America; b. Bapaume, France, 1645; d. Fort St. Louis, Texas, 1687. He became a member of the Récollet Order; was sent as a missionary to Canada in 1675; accompanied La Salle in his western expedition; was with Tonti at Crèvecoeur, where he helped bring about peace between the Iroquois and the Illinois; in 1682 went down the Mississippi with LaSalle; and in the same year returned to France. For a time he was warden of a convent in his birthplace. But in 1684 he set out again with La Salle for the mouth of the Mississippi. He was left by LaSalle at Fort St. Louis and there massacred by the Indians. He wrote a description of his trip down the Mississippi, which was incorporated by his cousin Christian le Clerq into his 'Etablissement de la Foi dans la Nouvelle France' (1691), and which was later unscrupulously copied by Hennepin (q.v.). This narrative has sometimes been attributed to LaSalle.

Memel, mā'mēl, Germany, an important fortified seaport of Prussia, near the Russian frontier, at the north extremity of the Kurisches Haff, at its opening into the Baltic, 70 miles northeast of Dantzic. It was almost wholly destroyed by fire in 1854, and was rebuilt in modern style. It has a large harbor, and exports from Lithuania and Russia timber, flax and linseed, coal, manure, grain, and herrings; has also manufactures of brandy, soap and chemicals, sawmills, iron foundries, breweries, and ship-building yards. Memel was founded in 1252 by the Livonian order, who gave it to the Teutonic Knights, by whom it was fortified in 1404. It suffered severely in the Lithuanian wars (13th to 15th centuries). Here in 1807 Frederick Wil-

liam III. of Prussia took refuge, and a treaty with England was signed. Pop. (1900) 20,174.

Mem'ling, or **Memlinc**, **Hans**, Flemish painter: b. Mainz 1430; d. Bruges 1495. He settled at Bruges 1478, of which town he was a prosperous citizen until his death. While all that is handed down of his biography is apocryphal, it is evident, from his works, that he was an imitator of Roger Van der Weyden, although he avoided the harshness and ungraceful drawing of that artist's style. He stood alone among the Flemish painters of his day in the religious tenderness of his pictures, their life-like expression, their exquisite coloring and modeling. His chief works are to be found in St. John's hospital, Bruges, namely, the altarpiece 'Marrriage of St. Catharine' (1479); 'Portrait of Maria Moreel as Sybilla Persica' (1480); and the 14 scenes illustrating the legend of St. Ursula and the 11,000 Virgins of Cologne (1589). In the Academy of Bruges is a triptych of his in the central panel of which are Saints Christopher, Maurus and Ægidius, and on the wings, Burgomaster Moreel (who offered the picture) with his family. In the Royal Gallery at Turin is his 'Seven Dolors of Mary'—a passion picture; in the Pinakothek at Munich a companion picture, 'The Seven Joys of Mary.' Consult, Michiels, 'Memlinc, sa Vie et ses Œuvres' (1883); Wauters, 'Sept Etudes pour Servir à l'Histoire de Hans Memlinc' (1894).

Memmi, mēm'mê, **Simone**. See MARTINI, SIMONE.

Memminger, mēm'mīn-jēr, **Christopher Gustavus**, American politician, secretary of treasury in the Confederate government: b. Wurtemberg, Germany, 17 Jan. 1803; d. 7 March 1888. He was brought to America in infancy, and was educated at South Carolina College. He studied law; began to practise in Charleston in 1825; entered politics as a leader of the Union party, attacked the States' Rights party in a satire called 'The Book of Nullification' (1832); reformed the public school system of the State; and for 20 years was in the State legislature, much of the time acting as head of the finance committee. In 1859, after John Brown's raid, he was commissioned by South Carolina to consult with other delegates in Virginia as to the best method of warding off attacks of Abolitionists. From the formation of the Confederacy until June 1864 he was secretary of treasury; and his mistaken policy in that office did much to ruin the Confederacy financially.

Mem'non, in Greek mythology, the son of Eos (Dawn), an Ethiopian prince, nephew of Priam, for whom he fought at Troy. After he had killed Antilochus he was defeated by Achilles. The post-Homeric legend adds that his mother wept bitterly for him, even after he had been made immortal. Memnon's kingdom was localized on the west bank of the Nile, and one of the colossal statues of Amenhotep III. as early as the 1st century A.D. became connected with the myth. It was said to portray Memnon, and the musical note emitted when the sun's rays struck the statue in the early morning (probably due to the action of sudden heat on the chilled damp stone) were explained as Memnon's greeting to his mother. The statue, rehabilitated by Severus, is no longer sonorous. The name Memnonium was applied in the Ptolemaic period not

MEMNONIUM—MEMORY

only to the west bank of the Nile, as "Memnon's land," but to a temple near Abydos, excavated by Mariette in 1859, which contains the famous "gallery of kings." This has a list of 76 Egyptian kings, and dates from the time of Seti I. and his son Rameses II. This Memnonium contains many other important sculptured documents.

Memnon'ium. See MEMNON.

Memorial Arch, an arch usually built across an avenue or street, or at an entrance to a park, garden or other public place, to commemorate some person or event. The Washington Arch in Washington Square, New York city, is a well-known American example of the memorial arch. It is built of marble and is adorned with elaborately carved figures.

Memorial Day. See DECORATION DAY.

Memory and its Disorders. Locke has defined memory as "the power the mind has to revive perceptions which it once had, with the additional perception that it has had them before." Ribot summarizes three ideas as constituting memory: (1) the preservation of certain states; (2) their reproduction; and (3) their recognition; and apart from metaphysical quibbles and niceties this is the common-sense view of memory. The Hamiltonian distinctions between recollection and memory are of little practical import; but the differences between memory and imagination are fundamental. Certain memories may be said to be subconscious, so that the third part of Ribot's definition and the additional perception of Locke may need a certain degree of extension. It is now clearly recognized that the collections of gray matter in the cerebrospinal axis below the cortex may be capable of storing impressions, and it is even thought by many that all parts of the sensory nervous system may be said to be concerned in mind-action and in memory. It is largely a question of terminology whether or not consciousness of previous experience should determine what we call memory. If so, then so-called subconscious memories need another term, and the whole subject-matter of memory in hypnotic and allied states is in need of thorough overhauling. From a purely mechanical point of view memory is interpretable as a result of a biochemical phenomenon. The sensory nerve-cells, being acted on by certain stimuli, whether of touch, taste, hearing, or sight, undergo certain molecular changes. Repetition of similar impulses induces similar reactions and a habitual response in the affected cells results. A line of least resistance is established, and in these habitual responses the germ of the idea of memory is to be found. From this point of view the nerve-cells retain something as a result of a previous experience, and the repetition of the stimulus finds the cells in a receptive state. Continued repetition of the stimuli constitutes a memory, and in this sense the training of a certain mechanism has bound up in it this mechanical theory of memory. Thus a muscular effort, as in tennis, or skating, or piano-playing, becomes by repetition remembered in automatic action, it may be without consciousness. It very frequently happens, in fact it is the usual rule, that many muscular acts which in their acquisition have called for conscious memories soon become automatic, and the effort no longer rises into consciousness, perhaps be-

cause of its diminished intensity. A similar point of view may be held for sound-impressions, for taste, for touch, for sight, in each individual case a different series of nerve-cells and nerve-fibres being involved. Thus the memory for a poem may mean a habit-response to a series of sight or sound impressions, or of the muscular memories of the speech mechanism that has learned to repeat the phrases. The actor who automatically says his lines, often not conscious of what he is saying, the pianist who mechanically plays, or the golfer who unconsciously drives true, all show the same class of memory adaptations, involving different nervous chains.

Memory, however, does not depend on repetition of stimulus alone. There are variations in intensity and duration of stimuli, modifications in plasticity of the nerve-cells themselves, the quality of attention, and above all the native individual character of health of the nerve-tissue itself—all of which factors enter into the everyday variations in memory that are familiar to all. The fixity and enduring quality of the memories of childhood are proverbial, and are due to the great plasticity of the youthful nerve-cells, as well as to the intensity of the early pictures. That one person should have a good visual memory and a poor auditory memory, and *vice versa*, must naturally be interpreted as due to variations in individual capacity. Modern pedagogy has slowly recognized these variations, and the greater prominence given to play, and to methods of precision, be they manual, lingual, auditorial, or visual, and less to distinctly formal methods of memorizing as a purely visual process from a printed page, may be regarded as evidence of this wider recognition that memory should be a generalized function, and not a pedantic cramming of any sort. A well-trained muscular system may be of far greater use to a man than any of his acquired knowledge. It is impossible to train certain children to do certain things, whereas in other directions training may result in great proficiency.

Disorders of Memory.—The disorders of memory fall into two classes, those of excess and those of defect. The general term for deficiency or loss of memory is amnesia, although this term fails to express the various distortions of memory, the illusions, or slight absences; and there are no technical words to distinguish temporary or permanent, periodic or progressive stages of the amnesic process. Inasmuch as memory is not one thing, but a great assemblage of processes which reflect a vast variety of psychological functions, situated not in the brain alone, but almost anywhere in the nervous system, a "defect in memory," as defined by Jastrow, "is an expression of the incapacity of a group (or of certain groups) of centres to exercise their normal functions; or a tendency which they show to functionate in an abnormal manner." Defects of memory may be general or special. General defects may be due to an incapacity on the part of nervous centres to establish residua. This type is found in those people who never remember what they see, and, notwithstanding frequent repetition of an act, never acquire proficiency in it. Occasionally a reverse general condition is manifest wherein the power of memory is unduly exalted and impressions of past experience reappear with unusual brilliancy. Such states are known in

MEMPHIS

fevers, in intoxications of various kinds, alcohol, opium, etc., the hypnotic trance. Special defects may arise in which particular isolated experiences are cut out of the mind. Thus alcoholic amnesia, that may forget even a committed crime, is an illustration. Somnambulism and other hysterical states are characterized by defects of this special type. Another form of defect is observed when associated memory-groups are blotted out, as in the special disorder aphasia. (See APHASIA; SPEECH AND ITS DEFECTS.) Memory may be falsely localized in time, or in order; imaginary additions to real events may be present; or illusory remembrances of what has never been experienced occur.

Psychologically considered, memory defects may occur either in the storing or retentive part of the nerve-cells, or they may involve the much more complicated and associated process of reproduction of the retained images. Both processes may be involved at the same time. In imbecility, idiocy, dementia, etc., a born or acquired loss of retentive power is present. In pianists—for example, Paderewski—or chess-players—Morphy, Pillsbury, etc., a state of localized hypermnnesia is present. This group would include all such prodigies. Occasionally one sees these two groups represented in one individual, as in an imbecile who has great power for mathematical calculation, etc. A case of this kind proves that the old assumption of closely localized memory-centres is false. Memory may be said to reside in all parts of the sensory nervous system. In another group the ordinary amnesia may be placed. These vary with each individual and depend largely on the healthy tone of the nervous system. A third group would include the paramnesia, or illusions of memory: (1) those of simple nature, involving a loss of distinction between imagination and real memory, a condition which is almost universal and in its exaggerated phases is seen in "constitutional liars," many types of the insane being afflicted with this inability to distinguish; (2) double memory (identifying paramnesia), a very common form of memory-illusion, in which the thought of having seen, heard or felt "just that same thing before" is present; in some insanities this double memory being very prominent and often making "prophecs"; (3) associated paramnesia, in which things actually experienced suggest false memories of things not experienced; this condition being seen in children, and often leading to false testimony. In this last class most of the "presentiments," or antecedent knowledge of what has happened, may be grouped. It is largely on the basis of these suggested memories that faith-healing heals ills that really never existed save as suggested false memories. On these pseudo-remiscences much of the fabric of spiritualism, second sight, and similar phenomena, is reared. See IMBECY; PERSONALITY; SPEECH DISORDERS; and RETENTIVENESS.

Consult: Baldwin, 'Dictionary of Psychology and Philosophy'; Ribot, 'Diseases of Memory'; Guillon, 'Les Maladies de la Mémoire,' with full consideration of hypermnnesia (1897); Sallier, 'Troubles de la Mémoire' (1892); and Pardo, 'I disturbi della memoria' (1890).

SMITH ELY JELLIFFE, M.D.,

Managing Editor 'Journal of Nervous and Mental Disease.'

Memphis, mēm'fīs, Egypt, an ancient city near the apex of the Nile Delta, 12 miles south of Cairo, according to Herodotus, founded by Menes, the first king of Egypt. It was a large, rich, and splendid city, and the second capital of Egypt. After the fall of Thebes it became the sole capital. Among its buildings the temples of Phtha, Osiris, Serapis, etc., and its palaces were described as remarkable. At the time of the conquest of Egypt by Cambyses (524 B.C.) it was the chief commercial centre of the country, and was connected by canals with the Lakes of Mæris and Mareotis. With the rise of Alexandria the importance of Memphis declined, and it was finally destroyed by the Arabs in the 7th century. In Strabo's time (20 A.D.) it was, in population and size, next to Alexandria; in biblical history it is mentioned as Moph and Noph. The name Memphis is a corruption of Men-nofēr "good abode." Edrisi, in the 12th century, describes its remains as extant in his time. Among the works specified by him are a monolithic temple of granite 13½ feet high, 12 long, and 7 broad, entirely covered within and without with inscriptions, and statues of great beauty and dimensions, one of which was 45 feet high, of a single block of red granite. These ruins then extended about 9 miles in every direction, but the destruction has since been so great, chiefly for the construction of Fostat, an Arabic city on the opposite bank of the Nile, that although Pococke and Bruce fixed upon the village of Mitrāhīneh as the site (where prone on a mound are two colossal statues of Rameses II.), this was not accurately ascertained until the French expedition to Egypt, when the discoveries of numerous heaps of rubbish, of blocks of granite covered with hieroglyphics and sculpture, and of colossal fragments scattered over a space of three leagues in circumference, decided the point.

Memphis, Mo., city, county-seat of Scotland County; on the Keokuk & Western railroad; about 160 miles north by west of Saint Louis. It is in an agricultural region, and is the trade centre for a large part of Scotland and adjacent counties. The principal out-going shipments are farm products and live-stock. There are bituminous coal fields in the vicinity. Pop. (1890) 1,780; (1900) 2,195.

Memphis, Tenn., city, county-seat of Shelby County; on the Mississippi River, at the head of all-the-year-round navigation; on the Illinois Central, the Louisville & Nashville, the Yazoo & Mississippi Valley, the Kansas City, Memphis & Birmingham, the Saint Louis & San Francisco, the Choctaw, Oklahoma & Gulf, the Saint Louis, Iron Mountain & Southern, the Rock Island & Pacific, the Nashville, Chattanooga & Saint Louis, the Saint Louis & Southwestern, the Chicago, Saint Louis & New Orleans, the Southern, the Memphis & Gulf, the Mobile, Jackson & Kansas City, and the Union R.R.'s. It has steamer connection with all the river and Gulf ports; 26 steamers call Memphis landing home. It is about 820 miles above New Orleans and 450 miles below Saint Louis. It is the largest city in Tennessee, the fifth in size of the cities on the Mississippi River, and the most important place between New Orleans and Saint Louis. It is noted for its extensive trade in cotton and cottonseed products and in hardwood lumber. It has the only bridge (1903) spanning the Mississippi River south of Saint

MEMPHIS

Louis. This is a steel cantilever bridge, 1,895 feet in length, costing \$3,000,000, and opened to the public 12 May 1892.

Prior to 1880, Memphis was visited frequently by yellow fever, and in 1878 and 1879, passed through two terrible epidemics, losing about 5,000 of her population by death, and many thousand people left the city. This proved to be the turning point in her career, and since then, 210 miles of automatic, flush-tank, Waring system of sewers have been put in. The water supply of the city is obtained from 64 artesian wells, the average depth of which is about 400 feet. The present pumping capacity of the water supply is 30,000,000 gallons per day, and the daily consumption is 15,000,000 gallons. Among the cities of the United States with a population of 100,000 or over, Memphis ranks second in general healthfulness. The death rate is 12.75.

The city is well laid out and well built. The wide, well-shaded and well-paved streets, the fine public and private buildings, the parks with numerous large trees, all make the city most attractive. The combined park area is about 1,000 acres, besides two fine race tracks. The streets are paved with asphalt, vitrified brick, macadam, and gravel. About 250 miles of turnpike radiate from Memphis. Among the 850 industrial establishments are 11 cottonseed-oil mills, seven ice factories, seven grain elevators, 35 wholesale grocery houses, seven wholesale dry goods houses, seven wholesale drug houses, furniture factories, wood-working establishments of all kinds, foundries, machine shops, flour mills, pulp and paper mills, fibre plants, saddlery and harness factories, potteries, car works, pump works, wagon and carriage shops, cracker and candy factories, patent medicine works, sugar plantation machinery works, barrel and skewer factories, spoke factories, golf stick works, shuttle block works, trunk, screen door, and window factories, basket and box factories, egg case works, horse collar factories, engine and boiler works, refrigerator and cold storage machinery works, cotton gins, stove and range factories, handle and coffin factories, shaft and pole works, cider presses, distilleries, and breweries.

Among the prominent buildings are 123 churches, 65 schools and colleges, three public libraries, three first-class theatres, the custom-house, cotton exchange, Odd Fellows' building, Porter, Scimitar, and Equitable buildings, Masonic Temple, Gayoso Hotel, Woman's building, Randolph building, Goodwyn Institute, Memphis Trust building, Tennessee Trust building, a number of fine hotels, three large hospitals, and two orphan asylums. Memphis has a number of educational institutions, good public and parish and many private schools, the Memphis Hospital Medical College, the Maddox school for young women, the College of the Christian Brothers (R. C.), founded in 1871; Saint Agnes' Academy (R. C.), Sacred Heart Institute (R. C.), Saint Mary's School (P. E.), University School, and two public high schools. The Hannibal Medical College and the Le Moyne Normal Institute are for colored pupils. Five miles distant from the city is a National Cemetery, which contains 14,039 graves, of which 3,822 are those of unknown dead.

The annual expenditures for maintenance and operation are about \$1,000,000. The combined

capital and surplus of the 17 banks and three trust companies are \$6,000,000; the deposits \$25,000,000. The building permits issued in 1902 were valued at \$2,532,000. The progress the city is making at the present time is almost phenomenal. The growth of Memphis during the decade from 1890 to 1900 was greater than in any former decade of its existence. The population increased nearly 59 per cent. In 1890 the city had 250 industrial establishments, in 1900 more than 650, and 850 in 1903. Memphis is often spoken of as not only the metropolis of Tennessee, but also of Arkansas and Mississippi; the city is located in such a position as to be a great trading centre for each of these States.

The history of Memphis begins almost with the history of the United States. It was a landing and tenting place for the early explorers and missionaries. It was the home of the Chickasaw Indians, and the bluffs on which the city is located, 40 feet above high water and 80 feet above low water, have always been known as the Chickasaw Bluffs. In 1698 the French built forts on the site of what is now the city, and in 1794, the Spaniards erected forts at a time when Spain was claiming exclusive rights to lower Mississippi. Some of the foremost men in the United States owned lands in this vicinity and were interested in holding for their own country a right to free navigation on the Mississippi to the Gulf. Andrew Jackson, James Winchester, and John Overton sent to Memphis, in 1819, a small colony who established the first permanent settlement. In 1826 there were 500 persons in the settlement which was then incorporated as a town, and in 1849 a city charter was granted. The Union and Confederate forces tried to gain possession of the city at the beginning of the Civil War. On 6 July 1862 a Federal fleet under Commodore Davis conquered a Confederate fleet under Commodore Montgomery, thus placing Memphis in possession of the Union forces. General Forrest in command of Confederate forces attacked the city in August 1864 and took several hundred prisoners.

Memphis has always progressed commercially except during the Civil War, and when visited by the yellow fever epidemics. The great growth industrially has come within the last few years. The location is making the city a great railroad centre; the surrounding forests are making it a great industrial centre; and the alluvial lands of the Saint Francis Basin, Yazoo Delta, and the Valley of the Mississippi River will always make her a great commercial centre. In 1855 yellow fever attacked the city, and again in 1867, 1873, 1878, and 1879. The epidemics of 1878 and 1879 so paralyzed the industries of the city, that in 1879 Memphis was unable to liquidate the current indebtedness and the charter as a city was revoked. The former city was designated by the State Legislature as "the taxing district of Shelby County." The control of the district was vested in a board of public works composed of five members, and a governing council composed of three commissioners. The council instituted the sewerage improvements, liquidated the debts, and in 1891 the place was reincorporated and again chartered as a city. Memphis lost lives, property, trade, and credit; but the history of the deeds of heroism performed by many during the fear-

MEMPHIS—MENANDER

ful yellow fever epidemic overshadows in importance the history of financial difficulties.

Since the Federal census of 1890, the city limits have been extended; but the population as given in 1890 included both urban and suburban districts, and the increase from 1890 to 1900 was remarkable. The growth of the city may be seen from the Federal census reports. Pop. (1850) 8,841; (1860) 22,623; (1870) 40,226; (1880) 33,592; (1890) 64,495; (1900) 102,320. In 1900 less than 5 per cent were foreign born, and nearly 50,000 were of negro descent. The city directory for 1903 gives the population at 159,326.

Consult: Davis, 'History of the City of Memphis' (1873); Keating and Vedder, 'History of the City of Memphis' (1888).

I. F. PETERS,

Commissioner Industrial League, Memphis, Tenn.

Memphis (Tenn.), **Capture of.** At dusk 5 June 1862 the Union flotilla under command of Com. C. H. Davis appeared near Memphis and anchored two miles above the city. The Confederate flotilla, Com. J. E. Montgomery, commanding, was lying at the Memphis levee. At daylight the Union fleet began to drop down toward the city, and the Confederates advanced to meet it. There were no troops protecting the city. The flotillas were composed of the following vessels:

UNION	Guns	CONFEDERATE	Guns
Benton	16	Little Rebel	2
Louisville	13	Bragg	3
Carondelet	13	Beauregard	4
Cairo	13	Price	4
St. Louis	13	Sumter	3
Queen of the West	ram	Lovell	4
Switzerland	ram	Thompson	4
Monarch	ram	Van Dorn	4
Lancaster	ram		—
	68		28

Besides having more than twice the number of guns, the Union ordnance was much superior to that of the Confederates. The latter, however, made a desperate fight, which finally ended ten miles below the city, with the result that the Lovell, Beauregard and Thompson were destroyed; and the Little Rebel, Price, Sumpter, and Bragg captured. The Van Dorn escaped. On the Union side only the Queen of the West was disabled.

Immediately after the fight the mayor, in reply to a summons to surrender, informed Com. Davis that there were no troops with which to oppose him. The next morning detachments from troops under Col. G. N. Fitch, which accompanied the fleet, landed and took possession of the city.

Gen. Grant arrived at Memphis 23 June, and established the headquarters of the District of West Tennessee. He was recalled to Corinth 15 July, and Gen. Sherman was ordered to Memphis, reaching the city 21 July. He restored the mayor and the city government, and made them responsible for civil order. He continued in command at Memphis until his forces left to join Gen. Grant in the final campaign for Vicksburg, having previously participated in the first move against that city.

The raid of Gen. N. B. Forrest, of Confederate cavalry fame, into Memphis occurred 21 Aug. 1864. The Union forces and commanding officers were completely surprised, and barely escaped capture. Gen. C. C. Washburn, in com-

mand of the District of West Tennessee; Gen. R. P. Buckland of the District of Memphis, and Gen. S. A. Hurlbut, were asleep in the city. Gen. Forrest left the vicinity of Oxtord 18 August, with three brigades, making a forced march of nearly 100 miles. A strong detachment rode into the city at 4 o'clock in the morning, running over a regiment of 100-days men on picket, and capturing about 250 of them. This force divided into three, and at once surrounded the quarters of the three officers named. Each, however, escaped, Gen. Buckland succeeded in reaching his troops and promptly directing offensive operations. With the exception of inconsiderable skirmishes in its vicinity, Memphis thereafter remained in undisturbed Union control.

H. V. BOYNTON.

Memphremagog, mēm-frē-mā'gōg, a lake in the southern part of the Province of Quebec, Canada, extending into Orleans County in Vermont. It is about 36 miles long, north and south, and from two to six miles wide. It is irregular in shape, and along its shores are a number of small indentations, in some places low and other parts high and rocky. The land on the west shore is mountainous, the altitude of the highest points being about 3,500 feet. The outlet is Magog River, which flows into the Saint Francis River. A number of villages and summer residences are along the shore, and in summer steamers ply daily on the lake connecting all the shore towns and villages.

Menagerie, a collection of wild animals, exhibited in zoological gardens, in museums, and by circus companies traveling from city to city. See CIRCUS; ZOOLOGICAL GARDENS.

Menai (mēn'i) **Strait**, the channel between Wales and the island of Anglesey, is 13 miles long, and varies in width from 250 yards to two miles. A suspension bridge and the celebrated Britannia Tubular Bridge connect Anglesey with the mainland. See BRIDGES.

Menam, mā-nām', or **Meinam**, the chief river of Siam, rising in the Laos country, and flowing generally southward to enter the Gulf of Siam below Bangkok. Its length is about 900 miles, and for a considerable portion of its course it is navigable for small craft. It is subject to periodical overflows on which the crops of the rice fields along its banks are dependent.

Menan'der, the name of two Greek writers, (1) the comic dramatist: b. Athens, 342 B.C.; d. there 200 B.C. He was the pupil of Theophrastus, himself the pupil and successor of Aristotle as head of the Peripatetics, and author of 'Characters,' a somewhat more literary and popular enlargement of some ruling ideas of the Nicomachean Ethics; he was by such a teacher well trained for his dramatic vocation. He was, moreover, a friend of Epicurus from early life, and may thus have been imbued with that bonhomie which rendered him so genial an interpreter of manners. He wrote a hundred comedies which are distinguished from those of Aristophanes by their refinement, their freedom from personal and political virulence, and their graceful, sometimes beautiful delineation of feminine character. He was, however, outvalued in popular favor by his contemporary Philemon, whose ribaldry was irresistible to the Athenian playgoers. Only some fragments of his works survive in the original, the most im-

MÉNARD — MENDELÉEFF

portant of these relics having come to light in Egypt (1898). He was, however, closely imitated by Plautus and Terence, and in the 'Bacchides,' 'Stichus,' and 'Poenulus' of the former, and the 'Andria,' 'Eunuchus,' 'Heautontimorumenos' and 'Adelphi' of the latter we have very good representatives of the Greek dramatist's method and spirit. A fine antique statue of Menander is to be seen in the Vatican. (2) A Greek rhetorician who flourished in the latter half of the 3d century B.C. He has left the rhetorical treatise 'De Encomiis,' and from his analyses of the orations of Demosthenes, most of the scholia on that orator have been compiled. Consult: (on Menander the dramatist), Guizot, 'Ménandre' (1855); Horkel, 'Lebensweisheit des Komikers Menander' (1857); (on Menander the rhetorician), Ritschl, 'Der Rhetor Menander und die Scholien zu Demosthenes' (1883).

Ménard, mā-nār, Michel Branamour, American pioneer: b. Laprairie, Lower Canada, 1805; d. 1856. He was of French parentage, and after working some time for a Detroit fur-trading company entered the service of his uncle, also a fur-trader, in Missouri. The Shawnees made him their chief, and he acquired great power among various Indian tribes. Soon after 1830 he went to Texas, where he continued fur-trading with the Indians, and also dealt with Mexicans. When the Texans revolted against Mexico he held the Indians in check and kept them from acting against the insurgents. As a member of the convention at which the Texans declared their independence, and afterward of the Congress of Texas, he exerted an influence in the formation of that State. The greater part of the site of Galveston was included in a purchase made by him in 1836, and of that city he, more than any other man, is to be considered the founder.

Menasha, mē-nāsh'a, Wis., city, in Winnebago County; at the mouth of the Fox River, on Lake Winnebago, on the Government Canal of the Fox and Wisconsin River Improvement Company, and on the Chicago, M. & St. P., the Wisconsin C., and the Chicago & N. W. R.R.'s, about 90 miles north by west of Milwaukee. The first permanent settlement was made in 1847 and the incorporation was in 1874. Menasha, like other places on Lake Winnebago, is a favorite summer resort. It is in an agricultural region in which the lumber interests are prominent. The chief manufactures are flour, lumber, paper, brick, machine-shop products, woodenware, furniture, and woolen goods. The city has good public and parish schools, and a public library. Pop. (1890) 4,581; (1900) 5,589.

Menasse, mā-nās'ā, Ben Israel, Jewish scholar and writer: b. Lisbon 1604; d. Middelburg 20 Nov. 1657. He was in his 18th year rabbi of a synagogue in Amsterdam; mastered 10 languages, and published numerous works on theology and hermeneutics. After the decapitation of Charles I. of England, he took measures to secure a repeal of the statute of Edward I., by which Jews were excluded from England. Cromwell appointed a commission to consider his petition, and in 1655 the legal restrictions were removed. Among his most notable works is 'Vindiciæ Judæorum,' which was translated into German by Mendelssohn, 1782.

Consult Kayserling, 'Menasse Ben Israel' (1861).

Mencius, mēn'sh'ūs, the Latinized name of Meng-tse, that is, Meng the Teacher, a Chinese philosopher and recluse: b. Province of Shan-Tung about 372 B.C.; d. there about 289 B.C. He was educated by his mother with such success that the approbation contained in the phrase "the mother of Meng" has become proverbial. Mencius was one of the greatest of the early Confucians. During his time the governments of China were oppressive, and Mencius for many years wandered about in search of a prince who would consent to govern in accordance with true and just principles. Failing to find any such, he retired to his former seclusion and spent the rest of his life in perfecting his system and training up disciples. His works contain some enlightened views on man and society. He believed in the moral nature of man and had unbounded faith in the possibilities of progress under a good social and political system. He regarded all governments as from God, but at the same time he believed in the responsibility of rulers to their people and the people's right to depose or even put to death unworthy rulers. In a nation the people are the most important element, second comes the government, and third the monarch. The aim of a government, according to him, should be the happiness and education of the people, and any ruler who was content to leave his subjects in ignorance and misery deserved to be deposed. The teachings of Mencius were written out by his disciples in dialogue form, under the title 'The Book of Mencius,' which has been translated into Latin by Julien (1824) and into English by Collin (1828). Consult: Legge, 'Life and Works of Mencius' (1875); Faber, 'Lehrbegriff des Philosophen Mencius' (1877).

Mendeléeff, Dimitri Ivanovitch, dē-mě'trē ē-van'ō-vich mēn-dyē-lā'yēf, Russian chemist: b. Tobolsk, Siberia, 7 Feb. 1834. He studied at the Institute of Pedagogy, Saint Petersburg, where he gave special attention to natural science; in 1856 became docent at the University of Saint Petersburg; was at Heidelberg in 1859-61, where he published his monograph 'On the Capillarity of Gases,' soon followed by 'Organic Chemistry.' In 1863 he became professor of chemistry at the Saint Petersburg Institute of Technology, and in 1866 was appointed to a similar professorship in the University of Saint Petersburg. The results of his researches on the compression of gases, which he closely pursued from 1871 to 1875, were set forth in his work 'On the Elasticity of Gases.' He was commissioned in 1876 to report upon the petroleum industry in the Caucasus regions and in Pennsylvania. His 'Aqueous Solutions' (1886), a work on experimental chemistry, has taken its place among the most important contributions to that branch of science. In 1890 his 'Tariff Elucidated' presented the protectionist views of which he had already become a well-known advocate, and which, as a member of the Council of Commerce and Industries, he actively propagated. When the Chamber of Weights and Measures was established by the Department of Finance, in 1893, he was appointed conservator of the weights and measures. His proof of the

MENDEL'S LAW — MENDELSSOHN-BARTHOLDY

periodic law (q.v.), first presented in 'Elements of Chemistry' (1868-70), is his crowning achievement in pure science. Consult Thorpe, 'Essays in Historical Chemistry' (1894).

Mendel's Law (of Heredity). See HEREDITY.

Mendelssohn, mën'döls-sön, **Moses**, German Jewish philosopher: b. Dessau, Germany, 6 Sept. 1729; d. Berlin 4 Jan. 1786. His father, Mendel, a schoolmaster, though very poor, gave him a careful education. He lived several years on the charity of persons of his own religion, devoting his time to study, chiefly in Hebrew and Hebrew literature, but also in mathematics and modern languages. In 1750 he was appointed by a silk manufacturer named Bernhard, a Jew, tutor of his children. At a later period Bernhard took him as a partner in his business. In 1754 he became acquainted with Lessing, with whom he contracted a close intimacy, which had a great influence on his mind. Intellectual philosophy now became his chief study. His 'Briefe über die Empfindungen' were the first-fruit of his labors in this branch. Mendelssohn contributed to several of the first periodicals, and now and then appeared before the public with philosophical works, which brought him fame, not only in Germany, but also in foreign countries. The most celebrated of these is 'Phädon', a treatise on the immortality of the soul, first published in 1767. Since that time it has gone through numerous editions, and been translated into most European languages. He established no new system, but was, nevertheless, one of the most profound and patient thinkers of his age, and the excellence of his character was enhanced by his modesty, uprightness, and amiable disposition. He knew how to elude with delicacy the zealous efforts of Lavater to induce him to declare himself a Christian. To this encounter between Lavater and Mendelssohn German literature owes one of its greatest dramas, Lessing's 'Nathan der Weise,' in which the author, in the person of the hero, commemorates the virtues, the tolerant spirit, and comprehensive mind of his friend Mendelssohn. His 'Jerusalem, oder über religiöse Macht und Judenthum' (1783) was much misunderstood, partly because he attacked many deep-rooted prejudices of his race. 'Morning Hours' (Morgenstunden) was published in 1785. The last work of Mendelssohn was in defense of his friend Lessing, of whom Jacobi had asserted that he was a Spinozist, was entitled 'Moses Mendelssohn und die Freunde Lessings' (1786). Consult Kayserling, 'Moses Mendelssohn' (1882).

Mendelssohn-Bartholdy, **Jakob Ludwig Felix**, German composer: b. Hamburg, 5 Feb. 1809; d. Leipzig 4 Nov. 1847. The kindly influences which, like a halo, encircled the life of the illustrious man, are reflected in many of his best compositions. He was born in prosperity, reared in plenty, and at nearly all times was surrounded by conditions conducive to success. It has been said that in no way was Mendelssohn's naturalness and naïveté more evident than in his constant reference to his own foibles; and further, that the hearty way in which he enjoyed idleness and boasted of it, were delightful in a man who got through so much work, who was singularly temperate, and whose only weakness for the products of the kitchen was for rice, milk and cherry

pie. "I do not in the least concern myself," said he, "as to what people wish or praise or pay for; but solely as to what I myself consider good."

It is doubtful whether the history of any other great musician discloses so wide a combination of qualities. Some of his biographers have expressed the thought that his happy disposition prevented his work from attaining that degree of depth which it might have done had his genius been subjected to fiery trials. Be this as it may, the fact remains that among all the German composers there is not one who has enjoyed such universal popularity, certainly in America and England, as Mendelssohn. His oratorios, 'St. Paul' and 'Elijah,' are sung everywhere, while his 'Hymn of Praise,' the 'Overture to the Hebrides,' his symphonies, sonatas, concert-overtures, settings for certain Psalms, and 'Songs without Words' are familiar to all.

Seventy-two of Mendelssohn's numbered works were published before his death, and 47 later, while 23 of his compositions, many of them including two or more pieces, had no "opus" numbers assigned to them. Six other of his published compositions have been recorded, while his unpublished pieces, mostly in autograph, and principally composed before he was of age, are quite numerous, including 12 symphonies, several fugues, concertos, sonatas, studies, fantasias, etc.

Felix was the second child and eldest son of Abraham Mendelssohn, a Jewish banker of Hamburg, and Lea (or Leah) Salomon, a resident of Berlin, and a Jewish lady of considerable property and attainments, to whom he was married on 26 Dec. 1804. The grandfather of Felix was Moses Mendelssohn (q.v.), who settled in Berlin in 1762 and married Fromet, daughter of Abraham Gugenheim, of Hamburg. Moses' father was named Mendel, a poor Jewish schoolmaster of Dessau, on the Elbe. Thus the name Mendelssohn (son of Mendel) simply perpetuates the oriental method of name-making.

When not three years old Felix was taken to Berlin, and five years later (1816) his father took him and his sister Fanny, four years the senior of Felix, to Paris on a business trip. While there they both received lessons on the piano from Madame Bigot, but it was not till after their return to Berlin that their systematic education commenced. Ludwig Berger became their piano instructor, and Zelter taught them thorough-bass and composition. In 1824 Moscheles became acquainted with the family, and while he declined to accept Felix as a pupil, consented to offer him suggestions and advice. In the same year Spohr visited Berlin and renewed his friendship with the family, which had been formed at Cassel in the summer of 1822 where the family had gone for the purpose of introducing Felix to him. In his 8th year Felix played the piano with remarkable ability, and about a year later (1818) he made his first formal public appearance. This was at a concert given by Joseph Gugel, a virtuoso on the horn. At 11 he joined the Singakademie as an alto. In 1820 Felix commenced systematic work as a composer, although before that time he had written from 50 to 60 complete movements. The earliest date of which a dated autograph is preserved was attached to a cantata entitled 'In rührend

MENDELSSOHN-BARTHOLDY

feierlichen Tönen,' which he completed on 13 January of that year.

The following year was eventful. He composed five symphonies, nine fugues, several pieces for the piano, two operettas, and a number of songs. It was in this year, too, that he visited Goethe at Weimar. The poet was delighted with his talent. While at Weimar he played before the Grand Duke and Duchess and improvised before the Court and also before Hummel. His compositions in 1822 were very numerous, and during this and the following year he wrote six symphonies, five concertos, a piano quartette, a violin sonata, a Magnificat and Gloria, and an opera in three acts, entitled 'Die beiden Neffen, oder der Onkel aus Boston.' On 31 March he played for the second time in public, at Aloys Schmitt's concert, taking part in a duo for two pianos, and again, on 5 December, he played at a concert given by Madame Milder-Hauptmann, when he gave one of his own concertos. It was probably in this year, too, that the practice of having informal musical performances on alternate Sunday mornings at the Mendelssohn home was begun. Felix directed, his sister Fanny presided at the piano, his younger brother, Paul, played on the cello, and his second sister, Rebecca, sang.

In 1824 his musical genius showed marked advance, as evidenced in his symphony in C minor, composed between March 3 and 31. In the summer he was taken to Doberan on the Baltic, a seaside resort, and there received the impressions which later found expression in his 'Meeresstille Overture.' His wonderful power of extemporizing and his readiness to play the music of other composers are noteworthy features, and Hiller, who was with him in Frankfurt in 1825, was carried away with his performances. In this year he met Cherubini in Paris, whither he accompanied his father on a visit. Toward the end of 1825 Mendelssohn's father purchased a large mansion, surrounded by spacious grounds, and under the influence of this charming home he became more and more devoted to his work. The beauties of Shakespeare were here unfolded to him. Felix was especially charmed with the 'Midsummer Night's Dream,' and probably then conceived the idea of the exquisite composition bearing that name which forms opus 61 and was first produced in Potsdam 14 Oct. 1843. The overture to a 'Midsummer Night's Dream' appeared earlier, and as a piano duet, its first public performance being given at Stettin in February 1827. Either during this or the previous year, Felix entered the University of Berlin, where he showed evidences of decided literary powers. On his return from Stettin he made preparations for his opera 'Die Hochzeit des Camacho,' but owing to the opposition of the director, Spontini, it was performed only once at that time, although, strange to relate, a complete performance of it was given at Boston, Mass., on 19 March 1855.

The principal compositions during 1828 were a cantata for the Tercentenary Festival of Albrecht Dürer, a cantata for a Congress of Science, an Antiphona for four voices, and a concert overture. He also completed his overture to Goethe's 'Calm Sea and Prosperous Voyage.' During this year he organized a choir of 16 voices for practising Bach's Passion music. The year 1829 was an important one for Felix.

Hitherto his father had not permitted him to regard himself as a professional musician, but this now being determined on, arrangements were made for him to visit some of the great capitals, with a view to gaining materials for his greatest works. His first journey was to England, where he arrived on 21 April 1829. He was received with much enthusiasm and also scored a success in society. His delightful manners and unfailing animation charmed every one. In November he was again in Berlin, and during the winter he completed the 'Reformation Symphony' for the Tercentenary Festival of the Augsburg Confession. He declined the professorship of music in the University, preferring to carry out the program which his father had mapped out for him. In May 1830 he visited Weimar, where he again met Goethe, afterward going to Munich, and later to Italy. Preparations for his return began in June 1831, and after visiting many cities he arrived in Munich, where his concerto in G minor was performed for the first time on 17 October.

Another visit to London was made in the spring of 1832, during which he composed with unabated vigor. Among the more important productions of this time were his musical representation of Goethe's 'Walpurgis Night,' and the 'Fingal Overture,' which was finished in Rome. Again in Berlin in July 1832, he gave several concerts, producing the 'Walpurgis Night' at one of them. His time was fully occupied in composing, playing and conducting. His 'Italian' symphony was completed in March 1833, and sent to London where it was produced on 13 May under his personal direction. Later in the month, we find him conducting the Lower Rhine festival in Düsseldorf, where, as a result of his success, he was engaged as director of "all the public and private establishments of the town" for three years with a salary of 600 thalers. He resigned, however, during the 2d year to accept the position of conductor of the famous Gewandhaus Concerts at Leipzig, then considered the highest position in the musical world of Germany. Thither he proceeded in August 1835, to make arrangements for the season which began on the 4th of October following. Seven concerts were given between that date and 20 November, when he was shocked by the news of his father's death which had occurred the day before. For the first time his radiant disposition forsook him and he fell into a despondent mood. During this season of sadness, however, he was able to finish the oratorio of 'St. Paul' while he also maintained the excellence of the concerts for which he was responsible. The great oratorio was first produced at the Lower Rhine Festival at Düsseldorf 22 May 1836. About this time he took charge of the Frankfurt Cacilen-Verein during the illness of the director, and there made the friendship of Madame Jean-Renaud and her family. He became devotedly attached to her youngest daughter, Cécile, to whom he was married on 28 March 1837. Returning to Leipzig he conducted another successful season, closing with a performance of 'St. Paul,' for the first time produced in that city. In August 1837, he left his bride for the purpose of conducting 'St. Paul' at the Birmingham Festival. This was his fifth journey to England, and before he returned he held conferences with his friend Klingemann over the plan of a new oratorio

MENDELSSOHN-BARTHOLDY

having the prophet Elijah as the central figure. He reached Leipzig on 1 October in time to conduct the first concert of the Gewandhaus on the same evening.

The year 1839 was notable for the composition of the 'Ruy Blas' overture for the Leipzig theatre, and the setting of the 114th Psalm to music. In the following year the invention of printing was celebrated in Leipzig by a festival, and the 'Festgesang,' for men's voices, and 'Lobegesang,' or 'Hymn of Praise,' were composed for the occasion. During this year Mendelssohn accepted the direction of the musical department of the Berlin National Academy of Arts, but before entering on his duties, he made another visit to Birmingham to conduct a performance of the 'Hymn of Praise.' On his return he was installed as General-Musik-Director in Berlin, but having the privilege of living where he pleased, he returned to Leipzig. About this time he composed the music for the 'Antigone' and 'Œdipus Coloneus' of Sophocles, Racine's 'Athalie' and Shakespeare's 'Tempest' and 'Midsummer Night's Dream.'

Another sad trial now befell him in the death of his mother, 12 Dec. 1842, and in November of the following year he removed to Berlin. The king of Saxony had recently established a Conservatory of Music, a plan which Mendelssohn had long cherished, and he and Schumann were appointed professors of composition and the piano. Meanwhile the Gewandhaus concerts were left in charge of Hiller. In 1844, he visited London for the eighth time in response to an invitation to direct several concerts of the London Philharmonic Society. In October he resigned his position as General-Musik-Director in Berlin, and took a much needed rest until the autumn of 1845 when he again assumed charge of the Gewandhaus orchestra.

Early in 1846 he was back in Leipzig where he took charge of two classes in piano and composition, and among his pupils were Goldschmidt, De Sentis, Tausch and others. The season of 1845-6 was unusually brilliant in concert work, and the programmes showed a great breadth of selection. At the eighth concert he brought with him Jenny Lind, who was then heard for the first time in Leipzig. On 5 Aug. 1846, a preliminary rehearsal of 'Elijah' was held in Leipzig, and soon after he started for England on his ninth visit, the complete score having been sent over a month earlier for translation. First there was a rehearsal with piano accompaniment at Moscheles' house, followed by two full rehearsals at the Hanover Square Rooms, and later by rehearsals in Birmingham, where on 26 August the oratorio was performed for the first time in public. One of his biographers states that "there was a mad rush at the close of the performance to grasp the hand of the hero of the day, who thanked all present for their share in the performance with which he was so deeply gratified." Returning to Leipzig he remodeled the oratorio, however, making so many changes that scarcely a movement stands to-day as it was originally written. The completed edition was published in July 1847. The Sacred Harmonic Society of London now invited Mendelssohn to give a production of 'Elijah' in its revised form in Exeter Hall, and for the tenth and last time he visited London in April 1847. Four performances were given Queen Victoria and the Prince Consort being present

at the second of the series. After giving other productions of the 'Elijah' in Manchester and Birmingham, followed by a performance with the Philharmonic Society, he returned to Frankfurt, weary and utterly worn out. To add to his now unhappy condition, his sister Fanny, whom he had loved devotedly, was stricken with paralysis, and died 14 May 1847. On hearing the sad news he fell fainting and for several weeks was utterly prostrated. Seeking diversion, he revisited Switzerland during the summer, where, it is said, he applied himself to water-color painting and made excellent progress in that direction. Later he resumed composition, numbering among his productions at that time the beautiful quartet in F minor (Opus 80), and he also wrote some parts of a newly commenced oratorio, 'Christus.' He returned to Leipzig in September, but attempted nothing serious in a musical way. His spirit was broken, and he dreaded to appear in public. The beginning of the end came on 9 October while calling on Madame Frege, whom he was accompanying in his last set of songs. She left the room to order lights, says one of his biographers, and on her return found him shivering and suffering violent pains in the head. He rallied somewhat, but another relapse occurred on 3 November, and he never spoke again. He died the following day, and on Sunday, the 7th, was borne to the Paulinen-Kirche, preceded by a band playing one of his 'Lieder ohne Worte' (Book V., No. 3), which Moscheles had scored for the occasion. Thence the coffin was taken to the Alte Dreifaltigkeits-Kirchhof in Berlin, where it was deposited in its last resting place.

A cross on the grave bears this inscription: "Jakob Ludwig Felix Mendelssohn-Bartholdy; geboren zu Hamburg, am 3. Feb. 1809; gestorben zu Leipzig am 4. Nov. 1847."

Mendenhall, men'dên-hâl, Thomas Corwin, American physicist: b. near Hanover, Ohio, 4 Oct. 1841. He was educated in the public schools and by his own efforts obtained a knowledge of physics and higher mathematics. In 1873 he became professor of physics and mechanics in the Ohio University, where he remained until 1878, when he accepted a call to the chair of physics at the Imperial University in Tokyo, Japan. There he founded a laboratory, an observatory, a scientific society, inaugurated a system of lectures, which work was highly approved by the Japanese government. In 1881 he returned to the Ohio University, and in 1884 accepted a position in the Signal Service at Washington. In 1886 he was elected president of the Rose Polytechnic Institute, but resigned in 1889 to become superintendent of the United States Coast and Geodetic Survey, and from 1894-1901 was president of the Worcester Polytechnic Institute. He has published several scientific papers and a book entitled 'A Century of Electricity' (1887).

Mendes, Catulle, kâ-tûl môn-däs, French writer: b. Bordeaux 22 May 1841. His verse is marked by extreme devotion to form. He has also written a great deal of prose—short stories, longer works of fiction, dramas. There is much affectation about them all. Among the titles of his books are: 'Poésies' (1878); 'Monstres Parisiens' (1882); 'La Rose et le Noir' (1885); 'Grande Maguet' (1888). Of his plays may be cited 'Le Capitaine Fracasse' (1872) and 'Fiamette' (1889).

Mendes Leal da Silva, José, hō-sā' măn'-dāsh lā-āl' dā sêl'vā, Portuguese statesman and poet: b. Lisbon 18 Oct. 1818; d. Cintra 14 Aug. 1886. He was minister of the navy and of foreign affairs; ambassador to France 1874-83; and to Spain 1883-6. His vogue as a poet has been very great in his own country and his 'Songs' ('Cânticos') were first collected in 1858. He wrote also a large number of plays, some of them very popular on the Portuguese stage, as 'Uncle Andrew from Brazil'; and 'The Sportsman'; and also several romances. He became a member of the Portuguese Academy in 1845.

Mendez-Pinto, măn'dāsh pên'too, Fernao, or Fernam, Portuguese traveler: b. Montemor-o-Velho, near Coimbra, Portugal, about 1510; d. Almada, near Lisbon, Portugal, 8 July 1583. He departed for the Indies in 1537, returning in 1558, and after his death a very curious relation of his voyages, 'Perigrinacao de Fernam Mendez-Pinto' was published, which has been translated into French, English, and other European tongues. Congreve, in his 'Love for Love,' called him "a liar of the first magnitude," and from that time his narrative

was considered as a romance; but his good faith and veracity are now generally admitted.

Mendiburu, măn-dê-boo'roo, Manuel de, Peruvian soldier and historian: b. Lima 1805; d. there 21 Jan. 1885. While a student he joined the patriot forces in 1821, was captured by the Spanish and held prisoner till the close of the war. Among various civil and military posts afterward held by him were those of minister of war and finance. He published a 'Diccionario historico-geografico del Peru,' a work of great value and highly prized by scholars. The first part, in eight volumes, deals with the Inca and colonial periods, and its publication, begun in 1874, was concluded after General Mendiburu's death. The second part has not been published.

Men'dicancy, a condition of permanent pauperism, where professional beggars are so numerous that government laws are necessary to remove or control them. A population of mendicants naturally results in a criminal community, and all countries containing this element have endeavored to remove this evil by legislation. There were beggars in biblical times. As early as 1351 France was compelled to pass laws against "Lazy persons, truants, and able-bodied beggars." Laws were passed in England on this subject as early as the time of Henry VIII. Mendicity has been found to exist to a greater extent in South European countries than elsewhere, and in Spain and Italy the professional beggar has been one of the greatest evils, the standard of prosperity, morality, and intelligence declining as mendicity increased.

According to the census statistics of 1900 there were 91,227 professional beggars in Spain, of whom 51,948 were women. In some of the cities beggars are licensed to carry on their trade. Seeking alms is recognized as a legitimate business, and the municipality demands a percentage upon the collections. Seville is the only city in the kingdom which forbids begging upon the streets. In some of the other towns beggars are allowed to come out and ply their trade one day in the week, perhaps Friday or Sunday, when the streets swarm with them as they go from house to house, sometimes on horseback, and it is said sometimes in carriages also. In Madrid there is no restriction and no license, and the streets are lined with them.

In 1903 the Spanish government passed a new law which aims to suppress vagrancy and begging, especially in the case of young children. It enacts that the parents and guardians of minors arrested for begging or wandering and sleeping on the highways and the public thoroughfares shall be liable to punishment by fines or terms of from 1 to 15 days' imprisonment. Heavier fines or from 15 to 30 days of imprisonment are imposed on parents and guardians who ill-treat children in order to make them beg, or who sell them to others for the purpose of begging. All persons convicted will forfeit their right to have the custody of the children for two years or more, at the discretion of the courts and authorities, who will place the minors in proper establishments for their support and education, until it is possible to restore them to their parents. This law, though introduced by the Minister of the Interior, was prepared by the Social Reform Committee, and drafted by

MENDICANT ORDERS — MENDOZA

a distinguished professor at the Madrid University, Senator Santa Maria de Paredes, formerly tutor in public law and economics to the king.

In Mexico, both Indians and native Mexicans to the number of thousands make up the army of professional beggars, and Mexico appears to have no laws to regulate them. In the Mexican cities and at fairs and festivals the mendicants are to be seen in astonishing variety; some maimed, some blind, and able-bodied fellows with most artistic "make-ups" of tattered garments and unkempt hair and beards. Some of these stand before one silently with a dumb appealing look in their eyes. Others kneel in the midst of the way, and fill the air with their doleful stereotyped appeals for charity. These beggars are humbugs after the manner of their kind the world over.

In the United States, where labor is in greater demand and better paid than abroad, there seems to be no excuse for mendicity, and yet there are many professional beggars here, largely able-bodied foreigners. The laws of Massachusetts, New York, and some other States make vagrancy a crime, and authorize the commitment of tramps to the workhouse, house of correction and common jail for varying periods. In the Atlantic coast States the evil is developing with alarming rapidity and demands more stringent treatment than heretofore.

New York city is a beggars' paradise. Between 6,000 and 8,000 professional mendicants make that city their home. Every other city in the United States suffers from the professional beggar, but not to the same extent as New York. The outdoor officer of the Charity Organization Society says that mendicants from all parts of the country flock to New York because the indiscriminate giving there is so common. Cities and States ship their beggar population to New York. About 10 per cent of these beggars are women.

Through the winter the arrests of professional beggars in New York average 200 a month. For the first offense the beggar gets five days' imprisonment, and for the second, third, and so on he should receive 40, 80, 160 days, and finally six months. But as he comes up under a different name each time, five days is his usual sentence. At the end of that short period he is preying on the community again.

Mend'icant Orders. See MONASTICISM.

Mendive, mân-dê'vā, **Rafael Maria de**, Cuban poet: b. Havana, Cuba, 24 Oct. 1821; d. Matanzas, Cuba, 1886. His first collection of poems (1847), entitled 'Passion-Flowers,' is widely popular. Banished in 1860, he lived alternately in New York and Nassau, writing legends and stories in verse. He was one of the most notable of Spanish-American poets; and many of his verses received English, French, and Italian translations.

Mendocino. See CAPE MENDOCINO.

Mendo'ta Lake. See FOUR LAKES.

Mendoza, mên-dô'thā, **Antonio de**, Spanish administrator: b. about 1485; d. Lima, Peru, 21 July 1552. In 1535 he was appointed by the Emperor Charles V., with whom he was in great personal favor, viceroy of New Spain (Mexico), being the first of 64 viceroys, with the longest administration, and that which shows the best record, in the history of that

provincial government. He made many reforms, especially in relieving the oppressed natives; developed agriculture and mining; established the first Mexican mint; founded the first college; and introduced the first printing-press. In 1551 he became viceroy of Peru, where he caused to be prepared a code of laws that has been the basis of the colonial and, to a large extent, of the present legal system of the republic. It was under Mendoza's administration in Mexico that Francisco Vasquez de Coronado (q.v.) undertook his famous exploring expedition.

Mendoza, Diego Hurtado, dê-ā'go hoor-tā'do, Spanish author and statesman, great-grandson of the Marques de Santillana (q.v.): b. Granada 1503; d. Madrid 15 April 1575. He was educated, as a younger son, for the Church, but, after studying Arabic at Granada and the humanities at Salamanca, entered the army, and in 1525 fought at Pavia. He acted as Charles V.'s ambassador to England in 1537, to Venice in 1538, to the Council of Trent in 1545, and to the Papal See in 1547, when he became governor of Siena. With Philip II. he quarreled, and in 1564 was interned in Granada, only returning to court in 1574, soon before his death. To his stay in Italy was due his influence in making the Spanish lyric thoroughly Italianate; and from Italy he brought an unusual knowledge of the classics as well as a fine collection of Greek manuscripts. Mendoza also perfected the Spanish poetic epistle. The famous romance, 'Lazarillo de Tormes,' has been ascribed to him. But his greatest work is his history of the Moorish insurrection, 'Guerra de Granada,' a model of historical impartiality, and on a theme for which knowledge of Arabic peculiarly fitted him. So impartial was this work that it was not published complete for many years, and even now a good edition is a desideratum. Consult the biography in German by Fescenmair (1882).

Mendoza, Pedro de, Spanish explorer in American, founder of Buenos Ayres: b. Guadix, Granada, about 1487; d. at sea 1537. He was a favorite of Charles V.; fought bravely in Italy; and in April 1535 left Spain with 12 ships and 800 men, sailed up the Plata River, and founded the city then called 'Nuestra Señora de Buenos Ayres.' His further movements were unfortunate; Indians and disease attacked his men, three fourths of whom, including his own brother, were lost. The natives captured and burned the city, and Mendoza, rescued none too soon by his brother, who came with reinforcements, set sail for home. But his health and reason were undermined and he died on board ship.

Mendoza, Argentina, a province in the western part, on the eastern slope of the Andes Mountains; area, 54,000 square miles. Mount Aconcagua, 22,427 feet, is on the northwestern boundary. The western part of the province is mountainous, the eastern part pampa land and fertile where watered by the streams or by irrigation. It is rich in minerals, especially silver and copper. Coal and petroleum abound. Grapes grow luxuriantly and a large quantity of wine is shipped to the other provinces. Cattle, hides, and wool are the chief exports. Wheat and corn are increasing in importance. Pop. 118,000.

MENDOZA — MENGES

Mendoza, Argentina, city, capital of the province of Mendoza; at the base of the Andes, on the eastern side of the mountains, on the railroad which extends from Buenos Ayres to Valparaiso, Chile; about 600 miles west by north from Buenos Ayres and 165 miles east of Valparaiso. It is about 2,400 feet above the sea. The city was founded in 1559. In 1861 it suffered from an earthquake which killed about 10,000 people and destroyed a great part of the city. It is the seat of two national normal schools, a national college, and an agricultural institute. Pop. 20,000.

Mendo'zite, a native soda alum, so named from the province of Mendoza in Argentina, where it is found in the form of white fibres.

Mene, mē'nē (numbered); **Tekel** (weighed); **Upharsin** (divided), the Chaldee words traced on the wall at Belshazzar's feast, and significant of his impending doom (Dan. v.). The astrologers could not read them, because they were written in antique Hebrew characters, but Daniel understood their awful meaning; and the same night witnessed their fulfilment.

Menelaus, mēn-ē-lā'ūs, in Greek legendary history the son or grandson of Atreus, and brother of Agamemnon. From his father-in-law Tyndareus, whose daughter Helen he married, he received the kingdom of Sparta or Lacedaemon. Paris, son of Priam, king of Troy, having carried off his wife Helen with a part of his treasures, and some female slaves, and conveyed them to Troy, Menelaus, accompanied by Ulysses, went thither to demand the restitution of his wife and property, and this being refused, he summoned the Greek princes to revenge the affront according to their promise. After the conquest of Troy Menelaus took Helen to return with her to his native land. Eight years he wandered before he reached home. On the island of Pharos, on the Egyptian coast, he surprised Proteus asleep and compelled him to disclose the means which he must take to reach home. Proteus likewise informed him that he should not die, but would be translated alive into Elysium as a demigod and the husband of Helen.

Men'elek, or **Menilek**, emperor or negus of Abyssinia: b. Ankobar 17 July 1844. His father, crown-prince of Shoa, died in 1855; the boy then fell into the hands of Theodore, his father's rival for the throne, who kept him under guard in Gojam, and attempted to win his allegiance by marrying him to one of his own daughters and giving him the high title of Dejasmatch. Menelek escaped to Shoa in 1865, raised an army, made himself king, and in 1889 succeeded John II. as negus of Abyssinia. For this place he claimed a hereditary right because of his descent from Balkis, queen of Sheba, and Solomon. He trained his army partly after European methods; protested against Italy's claim to a protectorate; defeated the Italian force at Adowa in 1896, but chivalrously permitted his captives to go away unharmed; and by the Peace of Addis Abeba (26 Oct. 1896) won Italy's acquiescence in his independence. In 1898 he came to an agreement with Great Britain, by which his boundaries are left intact; and in October 1903 received with much cordiality an envoy of the United States, who came to proffer Menelek a com-

mercial treaty and to invite him to the St. Louis Exposition.

Menendez de Avilés y Marquez, mā-nēn'-dēth dā ā-vē-lās' ē mār'kēth, **Pedro**, Spanish captain, founder of the city of Saint Augustine, Fla.: b. Aviles, Asturia, 1519; d. Santander 17 Sept. 1574. In June 1565 he sailed with 1,500 men in 19 vessels to dislodge the French in Florida; landed there 28 August; and 6 September began a fort, the nucleus of the present town. He attacked the French garrison at Fort Caroline, during the absence of part of the force, which had set out to attack him but was storm-stayed and finally wrecked. Menendez slaughtered the remnant at the fort and those saved from shipwreck. He returned to Spain in 1567; visited America twice again, strengthening St. Augustine in 1568, and in 1570 sending a party of colonists to the Chesapeake and up the Rappahannock, where they were massacred by the natives; and was recalled to Spain shortly before his death. During the last two years of his life he was governor of Cuba.

Menendez y Pelayo, ē pā-lā'yō, **Marcelino**, Spanish critic: b. Santander 3 Nov. 1856. He was educated at Madrid and Paris; in 1878 became professor of philosophy and letters in Madrid; three years later was elected to the Spanish Academy; and in the late '90's became director of the Biblioteca Nacional. He is an ardent admirer of the classics and is theologically and politically a thoroughly strict and conservative Catholic. His style is wonderfully finished and elegant, and his matter well handled. He wrote: 'Estudios críticos sobre Escritores Montañeses' (1876); 'Horacio en España' (1877); 'Historia de los Heterodoxos Españoles' (1880-1); 'Calderon y su Teatro' (1881); 'Odas, Epístolas y Tragedias' (1883); 'Historia de las Ideas estéticas en España' (1884-91).

Menes, mē'nēz, according to Egyptian traditions, the first king of Egypt. Herodotus relates that he was the founder of Memphis, which he built on a piece of ground which he had recovered from the Nile by altering the river's course. According to Diodorus, Menes introduced into Egypt the worship of the gods, as well as a more elegant style of living. He has been identified by some with the Mizraim mentioned in Gen. x. 6. A tomb supposed to be that of Menes was discovered near Nakâdeh by De Morgan in 1897. See EGYPT.

Meng-Tse, mēng-tsē'. See MENCUS.

Menges, **Anton Raphael**, German painter: b. Aussig, Bohemia, 12 March 1728; d. Rome 29 June 1779. In early childhood his father, Ismail Mengs, a miniature painter of little talent, who was settled at Dresden, took him in hand to make a painter of him, and in 1741 carried him to Rome and set him to study the antique, and to copy Michelangelo and Raphael. He was compelled to do a certain task in painting every day; his day's work subjected to severe criticism; and he was even punished if it was not satisfactory. From this constant practice he early gained skill as an artist, and when he returned to Dresden his talent and proficiency were at once recognized by August III., who appointed him court painter, and gave him permission to return to Rome. At Rome he attended the Academy, and in 1748 produced a

MENHADEN — MENINGITIS

large and elaborate composition, 'The Holy Family,' taking as model for the Mother of Jesus a beautiful peasant girl, whom he afterward married. On his return to Dresden he was commissioned to paint an altar-piece, 'The Ascension of Christ,' for the high altar of the Chapel Royal, and was given permission to return to Rome for the purpose of doing so. A new Academy of Painting having been opened in the Capitol he was appointed director, and painted for the Celestines the ceiling of their church, San Eusebio, for Cardinal Albani the 'Parnassus' in the ceiling of his villa, and several oil paintings, including 'Cleopatra,' 'The Holy Family,' and 'The Magdalen,' for private persons. When King Charles III. of Spain summoned him to Madrid he executed for him in fresco there 'The Assembly of the Gods' and 'The Descent from the Cross'; he also completed the altar-piece for Dresden. He returned to Italy in 1769, stayed eight months at Florence and painted for the pope a ceiling fresco for the Vatican library. In 1772 he went to Spain and produced for the king the fresco 'Apotheosis of Trajan,' his finest work, but returned to Rome in 1775. On his death the Cavalier d'Azara set up a statue to him and Catherine II. of Russia raised a splendid tomb for him in St. Peter's. He was certainly one of the most important painters of his day, and if he possessed none of the free and living originality of genius he was a master of noble composition and design. He was catholic in taste, and eclectic in style, drawing inspiration from the antique, as well as imitating Raphael, Titian, and Correggio, whose styles he tried to blend. Consult: Woermann, 'Ismail und Raphael Mengs' in the 'Zeitschrift für bildende Kunst,' Number 5, 1893.

Menha'den, a species of fish (*Brevoortia tyrannus*) of the herring family (*Clupeida*). Owing to the very large number of local names applied to this species much confusion concerning its identity and distribution exists in the minds of fishermen and others having only an unscientific knowledge of fishes. The name which heads this article is used chiefly in southern New England, and has become the book name of the species. North of Cape Cod it is the pogey, or occasionally the hard-head; in New York and New Jersey mossbunker, or some variation, as bunker or marshbunker, are the favorite names; the fishermen of Delaware and Chesapeake Bays know it as the bay alewife, and in the latter region and southward also as the bug-fish or bug-head, for a reason indicated below; still farther south it becomes the fat-back, and so on through a list of upward of 30 names, each of which has its advocates as the correct one. The specific name *tyrannus* does not refer to any quality of disposition of the menhaden, but was suggested by an association in the mind of the describer between a parasitic crustacean (*Oleocira prægustator*) living in the mouth of the fish and the foretasters of the Roman emperors. Like some other pelagic and migratory fishes the menhaden is exceedingly irregular in its movements and variable in abundance and distribution from year to year, but its general range is from Nova Scotia to Brazil and oceanward, so far as observed, to the Gulf Stream. In spring it approaches the coasts and extends northward with the alewives

and other species, probably for the purpose of spawning in brackish water, though little is actually known of its spawning habits. In winter Cape Hatteras marks the northern limit of its abundance. The menhaden swims in compact schools of large size, the movements of which at the surface, or sunken to a greater depth, are extremely irregular. Their seeming capriciousness has, however, been recently explained by a study of their food. Their gill arches bear a complicated and efficient system of filters, through which a large volume of water is strained as the fishes swim about with opened mouths and distended gill covers. Great quantities of minute animal and vegetable organisms are thus secured and swallowed.

From the other herrings the menhaden is readily distinguished by its very large head, large mouth, complex gill strainers and crenulated scales. The body is deep, the fins small, the mouth toothless and the color bluish and silvery, with one large and several small black spots.

Of all Atlantic coast fishes this is by far the most abundant, and, notwithstanding the incalculable millions annually destroyed by man and the predaceous fishes, birds and cetaceans, its numbers have shown no certain and permanent diminution, except in partially enclosed waters. Owing to its strong oily taste and extreme bonyness its value as human food is very slight, but as furnishing food for other fishes, as bait and for the manufacture of oil, fertilizer and other products, it has a very great economic importance. Large companies control its capture for the latter purposes and, besides pound nets, utilize many steamers provided with purse seines and derricks by means of which entire schools are taken at a haul and lifted on deck. The oil is extracted and the solid parts ground up for fertilizer at shore factories. The product varies from year to year, but the total weight of fish taken runs into the hundreds of million pounds. The following statistics are for the year 1888: Capital invested, \$2,230,755; number of factories, 55; number of steamers, 55; sailing vessels, 66; persons employed, 3,229; menhaden handled, 609,715,930; total value of products, \$1,655,920; oil manufactured, 2,818,007 gallons; fertilizer prepared, 48,344 tons. Consult Goode, 'History of the Menhaden,' Rep. U. S. Fish Commission, 1879.

Men'hirs, elongated, rough-hewn monoliths standing with one end in the ground. They are found of various sizes, from about 6 to as much as 67 feet high, the latter being the height of that at Locmariaquer in Brittany. Singular superstitions naturally attach to some of them. See STANDING STONES.

Meningitis, inflammation of a membrane, especially of the meninges or membranes of the brain and spinal cord. It is very rarely a primary condition, and in any of its forms may be confounded with typhoid fever, mania, etc. Inflammation of the meninges is generally confined to the pia mater and the arachnoid membrane (leptomeningitis), but may extend to the dura mater. Pachymeningitis, inflammation alone or chiefly of the dura mater, may extend to the other membranes. Inflammation of the cerebral meninges is cerebral meningitis; of the spinal meninges, spinal meningitis; of those of the brain and spinal cord, cerebro-spinal meningitis. Ascending meningitis is a meningitis

MENINGITIS

ascending from the lower part of the spinal cord.

Pachymeningitis is comparatively rare. The form involving the external surface of the dura mater results from blows or other injuries, and from osseous growths. There may be no well-defined symptoms, but usually is local headache and tenderness on pressure. If the dura mater, which is normally free, is bound to the skull by fibrous exudation, and especially if pus forms and hemorrhages occur, there are symptoms of pressure. Inflammation of the internal portion of the dura mater may result from the extension of inflammation from adjacent parts, such as the ear, the frontal or the ethmoidal sinus; or it may attend cases of pernicious anemia, chronic syphilis, tuberculosis, and chronic wasting diseases. It occurs chiefly in old age, but has been seen in children. There are fibrinous deposits and extravasations of blood in cysts (hematoma), and occasionally pus forms. The brain is anæmic, sometimes softened. The symptoms are those of irritation—convulsions, vomiting, contracted pupils, a slow irregular pulse, etc.,—and those of compression or pressure—coma, etc. Pachymeningitis is usually fatal.

Cerebral meningitis (simple or cerebral meningitis), in the acute form, is not common, and is most apt to occur in men engaged in hard mental pursuits. It may be caused by injuries, by sunstroke, by spirituous liquors, etc., and is very dangerous, death usually occurring in from three to eight days. The brain is reddened and covered more or less with pus and coagulated fibrin or lymph, and its superficial layer is softened. There is almost always watery effusion into the brain-cavities. The symptoms are those of three stages: (1) headache; (2) delirium; (3) coma. At first there may be slight fever, some photophobia, frequency and irregularity of the pulse, and some contraction of the pupils. There is a disposition to vomit, a slowness in movements of the bowels, and often hyperæsthesia. Then comes delirium, which may or may not be active; the patient talks much, and tries to get out of bed; does not obey readily. There is more or less trembling of the limbs, with difficulty in moving them. One pupil is likely to be dilated. Sometimes strabismus occurs; the pulse is very irregular; and paralysis begins. Then follows coma, loss of sense, sensation, and of voluntary motion; there is sighing, the pulse is frequent and weak, the pupils do not respond readily to light, and the capillaries of the skin and eye are congested. Recovery from this disease cannot occur after the period of coma begins.

Sub-acute or chronic cerebral meningitis is a secondary disease, sometimes associated with chronic syphilis, Bright's disease, alcoholism, etc., though the cause is not always ascertained. The lesions are similar to those of acute meningitis, but less pronounced. There is less of serum and pus, and the exudated fibrin is more circumscribed. The symptoms are insidious and vague. Headache, vomiting, and photophobia are rare. The slight delirium is followed, it may be, by somnolency, irregular pulse, strabismus, and sighing respiration. With coma the pulse is rapid, 120 or more, and the patient dies as in acute meningitis.

Tubercular meningitis (a form of cerebral meningitis), also known as acute hydrocephalous granular meningitis and basilar meningitis,

is an acute tubercular inflammation of the pia mater, caused by a deposit of miliary granules over the surface of the brain, but most numerous at the base, in the track of the cerebral vessels, and in their sheaths. There is a noticeable vascularity, especially in the ventricles. The pia mater is thickened and opaque and covered with a semi-purulent exudation. Serum fills the ventricles and foramina, pressing upon the convolutions, and assists in softening portions of the brain. The lesions in this disease are rarely limited to the brain; tubercles are found in other organs, especially the lungs. The disease is a phase of that protean malady, tuberculosis, though the cerebral lesions may first be noticed. The primary causes are a hereditary diathesis (scrofulous or tuberculous), foci of caseous degeneration in some organ, a suppurating joint, or a scrofulous inflammation of bone. Exciting causes are impure air, exposure, unwholesome food, bad drainage, blows upon the head, excessive study and worry, etc. Though the disease is essentially a disease of early life (from nine months to ten years), it also attacks adults. Most of those affected die in from two to six weeks. The symptoms may be classed under three heads: (1) obscure symptoms; (2) those of rapid development; (3) those of coma. There are seen listlessness, loss of appetite, occasional vomiting, slowness of the bowels, and somewhat frequent pulse. Sometimes there is headache, a remittent form of fever, and then rapid development of diagnostic symptoms. The patient talks a good deal. There are irregularity of the pupils and pulse, a sharp "cephalic" cry, severe headache, insensibility to light and sound, grinding of the teeth, a flushed face in paroxysms, usually before convulsions, rolling and drawing back of the head, urine scanty and high-colored, oscillation of the eyes, obstinate constipation, etc. With coma comes strabismus; the pupils do not contract under the influence of light, but will contract and expand when the bowels rumble or the patient is moved. There are convulsions, paralysis, and automatic movements of the feet and hands, it may be for hours. The thumb may be turned in. There is a hollowed abdomen (boat-shaped), and congestion of the eyes, a puriform secretion sticking the eyelids together; involuntary discharge of bowels and bladder, are common. For treatment of this affection place patient in bed, in a quiet room; give easily digested food; apply an ice-cap to the head and warmth to the feet. Further treatment should be in the hands of a physician. Much can be done by parents and guardians to prevent the onset, by not developing the nervous system at the expense of the muscular and digestive systems. Precocious children are to be judiciously restrained, and outdoor life encouraged.

Spinal meningitis is not common; it is usually caused by injuries, is liable to occur in children with spina bifida, and is rarely amenable to treatment. Death occurs usually in from eight to ten days, either from extension of inflammation to the brain and pressure there by fluid, or from asphyxia due to spasms of the respiratory muscles. The lesions are similar to those of cerebral meningitis. The chief symptoms are pain in the spine and extremities, increased by movements of the body, great sensibility of the surface of the body, spasms of muscles, opisthotonos, and dyspnoea.

MENIPPUS — MENNONITES

Cerebro-spinal meningitis, or spotted fever, usually more of a fever than an inflammation, is due to blood-poisoning, generally appears as an epidemic, and is very dangerous. Death frequently occurs in a few hours; recovery usually requires 30 or more days. The disease has spread over sections of this country two or three times, mainly in the winter and spring. One form is characterized by fever with no eruption; the other by fever and an eruption. The disease has been confounded with typhus and typhoid fever. The symptoms are a chill or chilliness, followed by nausea and vomiting, fever, violent headache, sometimes with pain down the spinal column, great prostration, vertigo, tetanic rigidity of muscles, delirium, and other symptoms of meningeal irritation, followed more or less rapidly by those of coma. When there is an eruption it usually appears early, and consists of dark blotches, from the size of a pinhead to that of a nickel, and is not marked on the extremities.

Where death occurs within 12 hours from the time of attack only a congestion of blood-vessels of the brain and, it may be, of the spinal cord, is generally found. Almost always there is lymph or pus beneath the pia mater, and sometimes serous effusion in the pleura, pericardium, or peritoneum. The blood undergoes a change, ecchymoses are found sometimes in the muscles, or in connection with the pericardium or pleura. The most important thing in treatment is the production of free perspiration, with rest in bed. The use of blisters, etc., should be left to the physician.

Menippus, mē-nīp'ūs, Greek cynic philosopher, a native of Gadara in Palestine, and supposed to have flourished about 60 B.C. His writings were chiefly of a satirical kind. Lucian styles him "the most snarling of cynics," and in two or three of his dialogues introduces him as the vehicle of his own sarcasms. It appears that his satires were composed in verse and prose, on which account those of Varro were denominated Menippean, and for the same reason the name of Satire Ménippée was given in France to the celebrated piece written against the League and Philip II. of Spain, its head. His writings are lost.

Men'ken, Adah Isaacs (originally DOLORES ADIOS FUERTES), American actress; b. near New Orleans, La., 15 June 1835; d. Paris, France, 10 Aug. 1868. Making her debut with her sister as danseuses, at the New Orleans French Opera House, she was received with marked favor and visited Cuba, Texas, and Mexico. On her return to New Orleans, she published a volume of verse and taught French and Latin at a girls' academy in that city. In 1858 she appeared in 'Fazio' in New Orleans, and went to England in 1863-4, assuming the role of 'Mazeppa' at Astley's which won her popularity. On 30 Dec. 1866 she played in Paris for 100 nights, and later in Vienna and London. Her last appearance was in Paris in May 1868. She was famous for her marriages and divorces; Alexander I. Menken, John C. Heenan, J. H. Newell, and James Barclay being her successive husbands.

Menno Simons, Dutch religious reformer; b. Witmarsum, Friesland, 1492; d. Oldesloe, Holstein, 13 Jan. 1561. He was ordained priest in the Roman Catholic Church and took pastoral work in the village of Pingium (1524), and

from a study of the New Testament, undertaken (1530) to solve his doubts about transubstantiation, he was induced to become an evangelical preacher and finally left the church of his ordination. The martyrdom of Sicke Snyder at Leeuwarden for Anabaptism impelled him to consider the Scriptural grounds for infant baptism. He was finally converted to the cause of the Anabaptists, but never sympathized with the excesses of Münster and wrote a diatribe against John of Leyden (q.v.) (1535). In 1537 at the request of a number of Anabaptists of Groningen he assumed the functions of an Anabaptist preacher and exercised, by his moderation, a most salutary influence over his fellow-ministers. He now married, his change in faith having superseded his vow of celibacy, and began to travel as an evangelist not only in Friesland but throughout Holland and Germany as far as to Livonia. Being persecuted from place to place he finally settled in Oldesloe in Holstein, where he closed his ministry with the consciousness of having founded a large and flourishing sect, whose subsequent history is related under the title Mennonites (q.v.).

Views of Menno Simons.—Menno was rather a preacher of a system of personal sanctity than either a dogmatist or a violent fanatic like some of the Anabaptists. He was a man of pure moral and devotional enthusiasm, whose account of his own conversion reads like a passage from the 'Confessions' of Augustine. He sums up the results of his labors as consisting in the conversion and recovery of the wicked. Yet he formulated a somewhat vague profession of faith. He believed in the divinity of Christ, who was born on earth in Mary, that is, without taking upon him human flesh and blood. He rejected infant baptism, and baptized those only who made a personal profession of faith in Christ. He particularly emphasized the power of excommunication possessed by the Church, without which "the spiritual Kingdom of God on earth cannot," he said, "exist in purity and piety." He believed in the coming millennium (q.v.); he excluded civil magistrates from church membership on the ground that the church was a theocracy whose magistrates were the ministers. He declared that war and all taking and administering of oaths were unlawful, and regarded human science as useless, even pernicious to a Christian. These decrees, however, as modified by the explanations of Menno, differed little from those generally promulgated by the Reformed bodies of his day. His principal teaching was of a moral and practical character. He was a meek, humble, noble-minded man, carried away with the spirit of his times, encouraging all that was good and pure among his followers, and sternly rebuking the guilty. The best edition of his work is 'Opera Omnia Theologica of al de Godgeleerde werken vann Menno Simons' (1681). Consult: Harder, 'Leben Menno Simons' (1846); Roosen, 'Menno Simons den evangelischen Mennonitenge-meinden geschildert' (1848).

Mennonites, members of a Christian sect founded by Menno Simons (q.v.). The Anabaptists of the Netherlands, who were Menno's followers, did not call themselves Mennonites until 1536, when they organized and established their union. This union was, however, early disturbed by the complications springing from

MENNONITES

the most impracticable of their disciplinary canons, namely, that on the subject of excommunication. One section of the church wished for the strictest enforcement of the rule, and were called *die Feinen*, the Fine, and generally known as Flemings or Flandrians, from their province; these were the rigid literalists of discipline. The others, *die Groben*, the Coarse, or Waterlanders, so called from the district of Waterland, which they occupied, were milder in their interpretation of the canon. These latter were ultimately expelled from the body. Another schism took place at Amsterdam in 1664, between the Remonstrants (q.v.) and the orthodox party. By the year 1811 these breaches were all healed and a closer fellowship than ever bound the Mennonites together on the basis of a belief in baptism by infusion, for which adults only were eligible. Their disciplinary canon, however, modified by time or expediency, rests on the principle that the kingdom of Christ established on earth is a visible church, or community, into which the holy and just alone are to be admitted; and which is exempt from all civil institutions and the restrictions of civil law. The history of the spread of this strict and exclusive sect is interesting.

The Mennonites in Germany and Prussia.—The sect quickly overflowed the boundaries of the Netherlands, and in the 17th century its representatives were numerous in Germany, being counted at 70,000 in Moravia alone. Whenever they settled their Dutch thrift and industry caused the wilderness to blossom as a rose. Ferdinand II. expelled them in 1622; in 1730 and 1732 their refusal to serve in the army brought on them the threat of expatriation. In 1789 they were forbidden to become land-owners, but their numbers in all Germany to-day are estimated at 18,000.

The Mennonites in Russia.—Catharine II. learning of their excellent qualities as colonists, invited the Mennonites to Russia in 1786 and three years later 228 families settled there. These were followed by many others. They were guaranteed safety to life and property, freedom of worship and a grant of land to each family, exemption from taxes and, among other privileges, exemption from military service in perpetuity. Mennonite immigration continued up to 1817. Since then these sectaries received other tokens of favor and good-will from the imperial government. But in the last half of the 19th century the condition of things changed. An edict addressed to all colonists in the empire announced that in 10 years the stipulation as to their exemption from military service would expire. The Mennonites were allowed 10 years to leave Russia, and after making inquiries as to advisability of crossing the Atlantic, they decided to leave Europe, and the United States was considered preferable to Canada as a place of settlement. Immediately \$20,000 was raised for the expenses of a commission of 12 men who should spy out the land and choose the most favorable spot for a Mennonite settlement. The western prairies and some of the Southern States were selected as most suitable, and large purchases of land were made.

The Mennonites in the United States.—Mennonites had settled in the United States as early as 1683. William Penn was struck by their resemblance in social habits to the Quakers, and invited them to settle in Pennsylvania. His re-

quest was accepted, and the first party of Mennonite immigrants had in half a century from their arrival increased to 500 families. They were most numerous in Germantown and Lancaster County. Spreading to Maryland, Ohio, Indiana, and New York, they became diffused over every quarter of the Union and of Canada, though most thickly settled in Pennsylvania, Ohio, Maryland, and Virginia. It is calculated that to-day they number 55,554 members, with 1,112 ministers and 673 churches. But the followers of Menno Simons since their departure from Europe have felt the liberty of this new environment, and are now cut up into no less than 12 separate and independent bodies. The oldest and largest of these is (1) the Mennonite Church, which includes about two fifths of the whole sect. It is most largely represented in Pennsylvania and Ohio, and has a publishing house at Elkhart, Ind., from which are issued four newspapers, one review and a great amount of Mennonite literature, historical, theological and educational. (2) The Bruderhoef Mennonite Church has five congregations, 352 members, and 9 ministers. They trace their origin to Jacob Hunter, who was burned at the stake in Innsbruck, 1536, and they settled in the United States in 1874. (3) The Amish Mennonite Church, second in importance among the divisions of this sect, has 365 ministers, 124 churches, and upward of 13,000 members. It consists of the followers of Jacob Amen, who separated from the main body in Switzerland, 1620. (4) The old Amish Mennonite Church, which has 2,438 members, 75 ministers, and 25 churches, adheres strictly to the ancient customs and ordinances of the sect and rejects all innovations. (5) The Apostolic Mennonite Church, a branch which came to the United States at the end of the first half of the 19th century, has two churches and about 200 members. (6) The Reformed Mennonite Church, started in 1812 under John Herr with the purpose of reviving the primitive customs of the sect. It consists of about 1,600 members and 43 preachers. (7) The General Conference Mennonite Church originated as a sequel to an attack made on a minister, John Oberholtzer, in Pennsylvania, who in 1848 was charged with introducing innovations. The followers of Oberholtzer formed this branch under him, and it now numbers about 10,000 members, and 128 preachers. (8) The Church of God in Christ started forth in 1859, under a missionary, John Halde-man. It adheres to the original doctrine and discipline and comprises 449 members. (9) The Old or Wislar Mennonites sprang from a division or dispute consequent on the introduction of Sunday Schools and evening meetings in the Mennonite Church in Indiana 1870. It comprehends 603 members and 15 churches. (10) Die Bundes Konferenz der Mennoniten Brüder-gemeinde originated in Russia 1840 and came to the United States 1873. It adheres to the practice of baptism by immersion, emphasizes the necessity of conversion as provable by plain evidence; and promotes foreign missions, notably in China, Africa, and India. Members 2,000, ministers 42. (11) The Defenseless Mennonites also lay stress on visible conversion. They are a branch of the Amish Mennonites. Members 1,200, ministers 20. (12) The Church of the Mennonite Brethren was organized in 1880. It is the most liberal of all the branches of the

MENOBANCHUS — MENSTRUATION

sect; its adherents are open communionists and indifferent as to the form of baptism. Consult: Martin, 'The Mennonites' (1883); and Krehbiel, 'The History of the General Conference of Mennonites of North America' (1895).

Menobran'chus, a genus of tailed amphibians, more properly termed *Necturus*, the single known species of which is the North American mud-puppy (q.v.).

Menocal, Aniceto G., American civil engineer: b. Island of Cuba 1 Sept. 1836. He was educated in Havana and was graduated from the Rensselaer Polytechnic Institute in 1862. In 1863-9 he was engaged as sub-chief engineer of the Havana waterworks and in 1870 returned to New York, where he was two years in the engineering of the waterworks department. He has been chief engineer of all the surveys made for the isthmian canal by the United States government and was sent to Paris in 1879 as member of the Canal Congress. He has furnished the estimates of the cost of the canal and was a member of the boards for selecting coaling stations in the Philippines, Porto Rico, and on the coast of Liberia, Africa. He is a member of several scientific societies and has published many of his official reports, etc.

Menominee, the French *FOLLES AVOINES*, a tribe of North American Indians of Algonquian stock, formerly known in upper Michigan and Wisconsin, along the Menominee River and Green Bay, and ranging west to the Mississippi, and south to the Fox River. Their name signifying "wild-rice men," hence the French translation, is derived from their use as a staple food of the abundant wild rice of the region. Their descendants in 1901 numbering 1,390, civilized and Roman Catholics, inhabit the Green Bay Reservation, Wisconsin.

Menominee, *mé nôm'î-nē*, Mich., city, county-seat of Menominee County; at the mouth of Menominee River, on Green Bay, and on the Chicago, M. & St. P., the Wisconsin & M., and the Chicago & N. W. R.R.'s; opposite Marinette (q.v.) and about 50 miles northeast of Green Bay, Wis. The first settlement was made in 1799 by Louis Chappieu, a French fur trader. The first lumber mill was built in 1832, but the town was not incorporated until 1883. It is situated in an extensive lumbering region, and it is one of the largest lumber-shipping ports on the Great Lakes. Its chief industries are connected with the lumbering interests; the principal manufactures are lumber in all forms, paper, shoes, boxes, machinery, telephones, steam-boilers, beet-sugar, electrical machinery, and lumber-camp outfits. The city has a fine high school, public and parish schools, and a public library which contains about 5,000 volumes. It has Saint Joseph's Hospital, the county buildings, and several fine churches. The government is vested in a mayor and council elected annually. The city treasurer and the justice of the peace are elected by the people; the other administrative officers are chosen by the mayor and council. Pop. (1890) 10,630; (1900) 12,818.

Menomonee, Wis., city, county-seat of Dunn County: on the Red Cedar River, and on the Chicago, St. P., M. & O., and the Chicago, M. & St. P. R.R.'s; about 68 miles east of Saint Paul, Minn. It is in an agricultural region and near the lumber section of the State. The chief manufactures are lumber, wagons, carriages, ma-

chinery, foundry products, brick, and flour. The trade is principally in lumber, flour, fur, brick, and wheat. Menomonee is the seat of the Stout Manual Training School and a normal training school. It has the Mabel Tainter Memorial library, which contains about 8,500 volumes. The Dunn County Asylum is near, but outside the city limits. Pop. (1900) 5,655.

Men'opause, the cessation of menstrual flow in women; climacteric; change of life. This epoch is reached generally between the 45th and 52d years, and is frequently marked by nervous disturbances. The power of child-bearing terminates at the menopause. See CLIMACTERIC; MENSTRUATION, DISORDERS OF.

Men'opome, a giant salamander of the genus *Cryptobranchus* (formerly *Menopoma*). See HELLBENDER.

Men'pes, Mortimer, English artist: b. Australia. He went to London when 19, studied at South Kensington; spent three years in Brittany at Pont Aven; traveled in Japan, where he learned something from Kyosai, in India, Burma and Cashmere, then through southern Europe, and in Mexico; and wherever he went continued his early experiments in color and his attempts to reproduce the atmosphere of various localities. Originally he used the color as dry as possible, then mixed it with petroleum, and finally used poppy-oil as a medium. He revived the lost art of printing in color from etched plates; made some excellent dry paint etchings, notably one of Hals' 'Archers of St. Adrian'; and published several volumes of pictures. His English house was made in the East, and is a wonderful piece of Oriental workmanship in gold and black.

Men'sa, or Mons, in astronomy, one of the 14 constellations which Lacaille discovered at the Cape of Good Hope. It is named from the mountain which is a conspicuous feature of the landscape at the Cape. The constellation is a very inconspicuous one near the South Pole, its brightest star being only of 5.3 magnitude.

Menstrua'tion, the discharge of the menses or bloody fluid from the female generative organs. In women it normally occurs at intervals of one lunar month, or 13 times a year (hence the use of the term *menses*, Latin plural of *mensis*, month). Its first appearance marks the stage of puberty, and is usually attended by definite changes—enlargement of the breasts, showing development of the mammary glands, growth of the ovaries, of the uterus and external genital organs, etc., and by other signs, physical and mental, of approaching womanhood and maturity. It usually begins, in temperate climes, between the 14th and 16th year, and continues its periodic recurrences until the menopause (q.v.) or final cessation of the discharge, which ordinarily arrives somewhere between the 45th and 52d years. The recurrent periods of its appearance, as well as their duration, vary with different persons, and not infrequently in the same individual; the variations, however, not always indicating abnormal or pathological causes. Menstruation is often at first, and in many persons throughout the catamenial age, attended by characteristic pains and symptoms, with physiological and psychological conditions of disturbance or depression, which sometimes call for special hygienic treatment. During pregnancy (with exceptional cases) there is no menstrual

MENSURATION

flow, its cessation being one of the earliest signs of conception. Observance of wholesome rules of exercise, rest, etc., helps to maintain normal conditions of body and mind, the reverse of which, owing to neglect of such rules, so often makes the menstrual function a visitation of dread and distress.

Disorders of Menstruation.—These include amenorrhœa, dysmenorrhœa, menorrhagia and metrorrhagia. Amenorrhœa is an absence of the menstrual flow from some cause other than pregnancy or the approach of the menopause (q.v.) or tardy establishment of the menstrual function. It is a symptom of anæmia (q.v.), or may be due to a constitutional condition such as profound nerve-fag or tuberculosis. Strychnine, iron, and ergot may be administered internally, or the physician may apply local treatment. (See DYSMENORRHEA.) Menorrhagia is an abnormally profuse flow during the menstrual period, due to one of several conditions. If not checked by rest, a physician is necessary, as also in metrorrhagia, which is a sanguineous flow between the menstrual periods.

Mensuration, in the broadest sense of the word is the art of measuring and is therefore restricted in its applications to quantities that admit of the establishment of some exact standard of comparison assumed as the unit. The subject may therefore be treated with reference to the different measures that have been adopted with respect to their corresponding quantities, the method of their construction, the instruments that aid in their application and their historical development (see WEIGHTS AND MEASURES). On the other hand mensuration may be treated as a science and as that branch of mathematics which has for its object the establishment of rules whereby the several dimensions of a geometrical magnitude or body may be derived from the most simple measurements. In this restricted sense, in which the term is commonly used, mensuration deals with the measurement of lines, surfaces and solids; mechanically by the use of instruments, geometrically by the aid of diagrams, or analytically, employing algebra, principles of arithmetic being involved in each case. If the lines to be measured are neither straight lines nor portions of circles, and the surfaces and solids bounded thereby are other than planes or those involving curves other than the circle, the laws that determine their measurements cannot, as a rule, be established without the aid of methods analogous to those of the infinitesimal calculus; otherwise the underlying principles are those of the geometry of Euclid.

Primary Units.—The first magnitude to be measured is the straight line joining two given points and its measure is the ratio of the length of the line to that of another, arbitrarily assumed as having the unit length. The unit of length having been adopted, the unit of area is uniformly made dependent thereon by defining it to be the area of a square constructed with each of its edges equal to the unit length. The unit of volume is then made dependent upon these by taking as the unit a cube whose edge has the unit length and whose sides contain the unit area. It follows that in all cases, the mechanical measurement involved is reduced to that of a straight line.

Commensurable and Incommensurable Magnitudes.—No matter what length is assumed as the unit it occurs more often than otherwise that

the line to be measured will not contain the unit adopted exactly, that is the ratio that determined the length cannot be precisely expressed by any finite number of units or by any finite series of proper fractions of the assumed unit. If the length can be so expressed, it is said to be "commensurable" with respect to the unit magnitude; otherwise it is "incommensurable." For example, if the lengths of two lines are respectively $\frac{1}{2}$ and 3 they are commensurable, but if they are denoted by 1 and $\sqrt{2}$ they are incommensurable, for in terms of the unit, $\sqrt{2} = 1.414 \dots = 1 + \frac{1}{10} + \frac{1}{100} + \frac{1}{1000} + \dots$, and a finite number of terms of this series would never equal the ratio

$\frac{\sqrt{2}}{1}$. On the other hand any desired approximation to the true length can be expressed and frequently, as in the case just given, the exact length can be laid off by employing a geometrical construction or a proper instrument. It follows that in demonstrating properties involving the ratios of magnitudes, it is necessary to prove that they hold true where the ratios are incommensurable. It is one of the ultimate aims of Euclid's geometry to prove rigidly that in all cases the area of a rectangle is equal to the product of its two linear dimensions, and further that the volume of a parallelepipedon, a special case of a prism, of which in turn the cube is a special case, equals the product of its three linear dimensions.

The Triangle.—Euclid also proves that the diagonal of a parallelogram divides the area into two equal triangular areas, and that triangles having equal bases and equal altitudes are equal, from which it follows that the area of any triangle is equal to one half the product of its base by its altitude. But any plane figure bounded by straight lines, that is, any plane polygon, can be divided into triangles by joining any intersection, or vertex, with each of the others; and it follows that the mensuration of polygons may be made to depend upon that of the triangle. The mensuration of the triangle becomes therefore a subject of first importance and forms a very practical part of the subject of trigonometry (see TRIGONOMETRY). The triangle, resolved into its elements, has three sides and three angles; and an important problem in mensuration is the proof that, when any three of these six elements are known, provided one of them is a side, all the other elements, and therefore the area, can be determined. The problems of land surveying, including the measurement of inaccessible heights and distances, depend ultimately upon this principle (see SURVEYING and TRIGONOMETRY). Inasmuch as plane angles can be measured with greater ease and far more accurately than straight lines, it is customary to measure only one line and two angles, and in nearly all cases involving plane areas and distances, it is sufficient to measure a single line.

Angular Measure.—For all theoretical investigations, the unit of angular measure is the "radian," which may be defined as the angle subtended at the centre of a circle by an arc equal in length to the radius.

Plane Figures Bounded by Curved Lines.—The ratio of the length of the circumference of a circle to the length of the radius may be obtained by the method of Archimedes and by several different modern methods and is equal to the incommensurable number $\pi = 3.14159 \dots$ (see GEOMETRY), and the infinitesimal calculus

affords a general method of obtaining the length of an arc of any curve, the area of any curved surface, or the volume of any area provided the position of any point thereon can be expressed as a continuous function of its co-ordinates (see CALCULUS).

Solids.—The tetrahedron, or triangular pyramid, plays the fundamental role in the mensuration of solids similar to that played by the triangle in the plane. Every prism, the cube being a special case, can be divided into triangular prisms which are in turn separable into pyramids. In like manner the frustum of a pyramid (and likewise any other polyhedron) can be divided into pyramids. It is demonstrated in Euclid's geometry, that the volume of a pyramid is equal to one third the product of its base by its altitude; upon this result the other volumes may be made to depend. Finally the cone, the cylinder and the sphere are limiting cases of pyramids, prisms, and polyhedrons, respectively.

A working knowledge of the principles of mensuration requires a familiarity with Euclidean geometry, trigonometry, analytical geometry and the infinitesimal calculus. Any handbook for engineers will contain a collection of ordinary formulas stated without rigid demonstration.

J. BRACE CHITTENDEN.

Mental Science, an individualistic religious and philosophical belief numbering upward of 500,000 persons in the country who are followers of various beliefs, known as Divine Science, Divine Healing, Spiritual Ethics, Metaphysical Science and other titles. There is no organization of these owing to the variety of belief prevalent among them. Hence mental science stands for no definite set of dogmas; it differs materially from Christian Science (q.v.), in so much as the latter is based on the belief in Christ. A mental scientist bases his belief on the physical powers of the mind, without reference to anything Divine. Mental Science believes in the dominant power of mind over matter and in the cure of all diseases by purely mental effort.

Menthene, mēn'thēn, a colorless hydrocarbon oil having the formula $C_{10}H_{18}$, and obtained by dehydrating menthol ($C_{10}H_{18}O$) by the action of strong sulphuric acid, or by distilling it with zinc chloride or phosphorus pentoxid. It has a specific gravity of about 0.81, and boils at 333° F. It does not mix with water, but is moderately soluble in alcohol and in ether, and dissolves in benzene, turpentine, or petroleum.

Men'thol (peppermint-camphor), a brilliant white crystalline substance separated from the essential oil of mint (*Mentha*). It is obtained from official (also from Chinese and Japanese) oil of peppermint. Like thymol, menthol has considerable antiseptic power. It is chiefly used combined with chloroform and oils as a liniment for the relief of pain, or locally in the form of pencils as a remedy for neuralgic headache. Rubbed on the skin, it induces a feeling of coldness which is followed by a mild stimulating and anæsthetic effect. Sometimes menthol is used internally in solution for relief from nausea, flatulence, and colic, but it is more apt to excite inflammation of the stomach and intestines than the milder preparations of peppermint.

Mentone, mēn-tō'nē (Fr. MENTON, mōn-tōn), France, a seaport town and health

resort on the Mediterranean, in the department of Alpes-Maritimes, near the Italian frontier, and 19 miles by rail northeast of Nice. It is charmingly situated on a promontory about the middle of a bay five miles in circuit, encircled by abruptly rising hills. The ancient walls of the feudal town are still standing, and there the streets are dark and crooked. The new part of the town, with numerous fine villas, stretches along the base of the hill on which the old part is situated, parallel to the sea. The climate of Mentone is mild and equable; it is rare that the thermometer descends as low as the freezing point, or rises higher than 30° C. (86° F.), hence making Mentone a favorite resort for persons in delicate health. There is a considerable trade in fruit, in flowers, and leaves used in the manufacture of perfumes, and in olive-oil. The town of Mentone belonged to the principality of Monaco from 1346 to 1860, but in the latter year was ceded to France. In the vicinity, but on Italian territory, are the grottoes of Baoussé Rousse, popularly known as the Caves of Mentone, famous for the valuable evidences of prehistoric man that they have yielded. Pop. (1901) 14,913.

Men'tor, according to Greek legend, the faithful friend of Ulysses, who entrusted to him the care of his domestic affairs during his absence in the war against Troy. The education of the young Telemachus fell to his charge, and when the latter set out on his voyage in search of his father Minerva accompanied him under the form of Mentor (*Odyssey*, ii. 390; iii. 12, etc.), acting the part of a prudent and experienced counsellor to the young hero. This character of a sage adviser is more fully developed in the *Télémaque* of Fénelon, in which Mentor plays a conspicuous part. Mentor has thence acquired the metaphorical sense of a wise and faithful counsellor or monitor.

Menzaleh, mēn-zā'lē, or **Menzala**, Egypt, a large lake or lagoon extending from Damietta to the Suez Canal, and running parallel with the Mediterranean, from which it is divided by a narrow slip of land, from 2 to 12 miles in breadth. Length of the lake from northwest to southeast, about 38 miles; breadth, about 20 miles. It receives the Pelusiac and Tanitic branches of the Nile, and communicates with the sea by three openings called Dibeh, Gemileh, and Om Farjeih. The lake is of comparatively recent origin, and covers what was a fruitful district of the delta, having formed through neglect of the dams. There is a small town of the same name on the south side of the lake, which carries on a trade in rice, and fish caught in the lake. The Suez Canal runs along its eastern edge from north to south.

Menzel, mēn'zēl, **Adolf Friedrich Erdmann von**, German artist: b. Breslau 8 Dec. 1815. In 1830 his parents settled in Berlin, where his father had a lithographic studio, and where the son studied a little in the Academy and more by himself. At 18 he published a cycle of lithographs called 'An Artist's Wanderings,' which immediately attracted attention; four years later he had begun to draw historical scenes from the past of Brandenburg and had commenced painting in oils with 'Checker-Players' (1836) and 'Judgment' (1837). About the same time his work as an illustrator opened up with the 400 pictures for Kugler's 'Frederick

the Great' (1840), in which Menzel showed himself original, dramatic, and historically correct. This vein he followed out in his 200 illustrations for the 'Works' of Frederick the Great, and in 600 more accompanying a work on the army of Frederick the Great (1856); as well in his oil paintings, a dozen or more, of various scenes in Frederick's life. A trip to Paris in 1867, so the French critics claim, worked a change in Menzel's methods, so that he applied himself more to problems of light and shade. Since 1890 he has used color less and less and in his pencil drawing has broken away from mere line to the use of a cloudy treatment. He is one of the greatest of German artists of the present day; and in 1899 he received the Order of the Black Eagle, conferring hereditary nobility. Apart from his historical pictures, mention should be made of the 'Modern Cyclops' (1875), the interior of a Silesian rolling mill, with excellent lights, and of social satires like 'Carnival Morning' (1885). Consult Jordan, 'Das Werk Adolf Menzels' (1895); and lives by Sondermann (1895), and Knackfuss (1897).

Menzel, Wolfgang, German author: b. Waldenburg, Silesia, 21 June 1798; d. Stuttgart 23 April 1873. He studied at Jena and Bonn, became a follower of F. L. Jahn and the Turnerei, and was for four years schoolmaster at Aarau in Switzerland. In 1825 he returned to Germany, having already made himself known to the literary world by his 'Elastic Verses' (1823). He edited and contributed to magazines, and wrote a very great number of works, poems, romances, histories, criticisms, political polemics, and Christian theology. From 1826 to 1848, and again later, he was editor of the 'Litteraturblatt' in Stuttgart. His chief writings include histories of Germany (1825), German literature (1827), German poetry (1858), Europe (1853-57), and the world ('Universal History' 1862-72). He also produced a work of mythological research (1842), a book on the pre-Christian doctrine of immortality (1869), and autobiographical memoirs (1876). He was often involved in controversy, assailing with equal zeal theological rationalists and political radicals. His attacks upon Goethe and other authors were fully equalled for virulence by the criticisms upon Menzel himself, made by Heine and some of the younger German writers.

Mephistopheles, mēf-is-tōf'ē-lēz, a name for the devil, which has been made popular by Goethe's 'Faust.' Goethe derived it from an old popular legend, in which it is spelled *Mephistophiles* or *Mephistophilis*. The etymologies of the word are as various as the spelling. Some suppose it to be an irregularly formed Greek compound from the negative *mē*; *phōs*, light; and *philos*, loving, thus signifying "not loving the light." Others surmise that it may be derived from the Latin *mephitis* and the Greek *philos*, in which case it will signify literally "loving the mephitic vapors of hell." The Mephistopheles of Goethe has little in common with the devil of the popular imagination. He appears, especially in the original form of the drama of Faust, as a real man of flesh and blood, who only preserves those traits of the popular devil of the Middle Ages which are compatible with a true human individuality—as the companion of Faust, as a selfish and malevolent votary of pleasure, always looking to the real,

and bringing back Faust by cold and heartless irony, from barren speculation to the enjoyment of the present life.

Meran, mā-rän', Austria, a celebrated health resort in Tyrol, charmingly situated on the river Passer, near its entrance into the Adige, at the foot of a hill called the Küchelberg. It consists of an old and a new town, the latter with handsome villas and hotels, and numerous fine residences and old castles in the neighborhood. Lying in a sheltered situation on the southern slope of the Alps, it possesses a mild and equable climate, and is much frequented in winter by invalids with pulmonary affections. Pop. (1900) 9,284, with suburbs 17,951.

Mercadante, Saverio, sā-vā-rē-ō mēr-kā-dān'tā, Italian composer: b. Albamura 26 June 1797; d. Naples 17 Dec. 1870. He studied music at the college of S. Sebastiano in Naples under Zingarelli. From flute and violin he turned to vocal music; won great success with a cantata 'L'Unione delle Belle Arti' in 1818, and with an opera 'L'Apoteosi d'Ercole' in 1819; was made chapel-master of the Novara Cathedral (1833) and director of the Naples Conservatory (1840); and in 1862 became totally blind. He wrote many masses and other ecclesiastical music, such as 'The Seven Last Words'; but is best known for his operas, of which the following, out of a total of 50, should be mentioned: 'Elisa e Claudio,' 'Il Bravo,' 'Il Giuramento,' 'I Briganti,' and 'Le due illustri Rivali.'

Mer'cantile Agency, an American business and detective enterprise; an incorporated company which agrees to furnish subscribers who pay a yearly fee, with information as to the responsibility, financial standing and property interests of private individuals, or firms or corporations. The mercantile agency sometimes makes a business of collecting debts and bills of account. The business originated in the United States in 1837, following the financial panic of that year. Lewis Tappan was the founder of the first enterprise of this character in New York city. Consult: Errant, 'The Law Relating to Mercantile Agencies' (1889); Reinhard, 'A Treatise on the Law of Agency' (1902).

Mercap'tans (Latin, "taking up mercury"), or **Thio-Alcohols**, in chemistry, a large class of substances having the same constitution as the alcohols, but differing from them by having the oxygen atom in the hydroxyl replaced by sulphur. They are oily liquids or crystalline solids having an offensive, garlic-like odor, and are all insoluble in water. They possess acid tendencies that are more marked than those of the alcohols, and combine with metallic oxides to form salts which are known as "mercaptides." They combine with especial facility with mercuric oxid, and take their name from this circumstance. Ethyl mercaptan is the best known member of the series, and it is this substance that is understood when "mercaptan" is spoken of, without further qualification. Ethyl mercaptan, C_2H_5SH , is prepared by acting upon ethyl chloride, C_2H_5Cl , with potassium hydrosulphid, HKS ; the potassium atom and the ethyl radical changing places as indicated by the equation $C_2H_5Cl + HKS = C_2H_5SH + KCl$. Ethyl mercaptan is a colorless, mobile, liquid, boiling at 99° F. It is very inflammable, burning with a blue flame, and it mixes readily with

alcohol and ether, though only to a very slight extent with water. Like the other mercaptans, it forms salts with the oxides of the metals, the hydrogen atom that is associated with the sulphur being the one that is replaced by the metal. The mercury salt, $\text{Hg}(\text{S.C}_2\text{H}_5)_2$, may be prepared very readily by agitating the mercaptan (or its alcoholic solution) with red oxide of mercury, HgO . Its formation is attended by the liberation of considerable quantities of heat, and the mercaptide itself is obtained in the form of soapy white scales. All of the metallic mercaptides are decomposed by hydrochloric acid. The mercaptans of fatty radicals all give a fine green color when treated with a solution of isatin in strong sulphuric acid and this reaction (as well as their insufferable smell) is used as a test for their presence.

Mercator, mër-kä'tor, Gerardus (Latinized form of GERHARD KREMER), Flemish mathematician and geographer: b. Rupelmonde, Flanders, 5 March 1512; d. Duisburg 2 Dec. 1594. He studied at Louvain, and became a lecturer on geography and astronomy, making his instruments with his own hands. Recommended to Charles V., Mercator entered into the emperor's service, and executed for him a celestial globe of crystal, and a terrestrial globe of wood. In 1559 he retired to Duisburg, and received the title of cosmographer to the Duke of Juliers. His last years were devoted to theological studies. He is known as the inventor of a method of projection called by his name, in which meridians and parallels of latitude cut each other at right angles, and are both represented by straight lines, which has the effect of enlarging the degrees of latitude as they recede from the equator. His first maps on this projection were published in 1569; the principles were first explained by Edward Wright, in 1599, in his 'Corrections of Errors in Navigation,' whence the discovery has sometimes been attributed to him. His 'Tabulæ Geographicae' (1578) is the best edition of the maps of Ptolemy. See MAP.

Mercator's Chart or Projection. See CHART.

Mercedas, mër-sä'däs, Argentina, town, in the province of Buenos Ayres, on the Pacific railroad; about 40 miles west of the city of Buenos Ayres. In 1779 it was founded as a military station. An Irish colony settled here about 1800. Mercedas is in a region where the chief occupation is raising sheep and cattle. It has several manufacturing establishments, among which are flour-mills, soap factories, and cattle-yards. The shipments are principally wool, hides, and flour. The town has a public library and a college. Pop. about 11,000.

Mercenaries, or Stipendiaries, foreigners or others who received pay for their services as soldiers, especially as distinguished from government soldiers or those owing military service to the crown or nation. Hired professional soldiers appear very early in the history of military organization. Foreign mercenaries appear in the armies of Alexander the Great and the Romans. They were common in all armies, but generally engaged for a single campaign only. In England, Harold had a body of Danes in his army when he defeated the Norwegian king—the hus-carls, a body originally established by Canute. William III. had for some time a body of Dutch troops in his pay after he

became king of England; and throughout the 18th century Hessian and Hanoverian regiments were constantly in the pay of the British government for temporary purposes. Hessians fought for Great Britain in the Revolutionary War; and the landgrave of Hesse, who sold his troops at so much a head, received upward of \$2,500,000 for Hessian soldiers lost in that struggle. Americans have fought as hired soldiers in China, South Africa, and in nearly all the countries of Central and South America. They are generally known as "soldiers of fortune." Most of the officers in the regular Chinese army are either Englishmen or Americans. But most famous of all mercenaries were the Swiss soldiers, who were hired, sometimes by the cantons themselves, over all Europe, and formed many famous body guards. They were long employed by the French monarchs; and the Vatican at Rome still has its Swiss guards.

Mercer, mër'sér, Henry Chapman, American anthropologist: b. Doylestown, Pa., 24 June 1856. He was graduated from Harvard in 1879, where he was curator in 1894-7. In 1893-7 he was anthropological editor of the 'American Naturalist.' He has made extensive investigations and studies in anthropology in America, discovering several new extinct species, and has written: 'Lenape Stone' (1885); 'Researches Upon the Antiquity of Man in the Delaware Valley and the Eastern United States' (1897); 'Tools of the Nation-Maker' (1897); etc.

Mercer, Hugh, American general: b. Aberdeen, Scotland, about 1720; d. near Princeton, N. J., 12 Jan. 1777. Educated as a physician, he served as surgeon's assistant in the army of the Young Pretender at the battle of Culloden. Emigrating in 1747 to America, he settled in Virginia, and resided there, in the practice of his profession, until 1755, when he volunteered in the expedition led by Braddock to Fort Duquesne. At the outbreak of the Revolution he promptly joined the Continental army, and obtained the rank of brigadier-general. He subsequently accompanied Washington on his retreat through New Jersey, and rendered valuable assistance at the battle of Trenton. In the succeeding action at Princeton he was mortally wounded and died a week later. Mercer County, N. J., was named in his honor.

Mercer University, Macon, Ga., is an institution having its genesis at a meeting of the Baptist Associations of Georgia, at Powellton, 27 June 1822, held to discuss, among other matters, the question of ministerial education. In 1827, at a similar meeting, held in Washington, Ga., the project was further discussed, and in 1829, Josiah Penfield, of Savannah, bequeathed \$2,500 as a fund for education, on condition that the Baptists should raise an equal amount. This was promptly done, and two years later it was resolved to establish "a Classical and Theological School . . . open only for those preparing for the ministry." It was soon seen, however, that the school could not be so restricted, and in 1832 this bar was removed. Mercer Institute was established on a site of 450 acres, at Penfield, in January 1833, with 39 students,— "Penfield" in memory of Josiah Penfield, and "Mercer," after Dr. Jesse Mercer, early conceiver and patron of the school. In 1837, a charter was obtained giving the in-

MERCERIZED COTTON — MERCURIC CHLORIDE

stitution collegiate rank, and changing its name to "Mercer University." Thereafter it grew steadily. The successive presidents were B. M. Sanders; Otis Smith; John L. Daggs; N. M. Crawford; H. H. Tucker; A. J. Battle; G. A. Nunnally; J. B. Gambrell; and P. D. Pollock, still in office. The Civil War threw its affairs into temporary confusion, and in 1871 the college was removed to Macon. Since then its resources and influence have been greatly increased, gifts have been frequent and generous, and its educational status has become recognized as sound and sure. Its alumni roll includes very many distinguished names. Mercer University at present comprises three colleges — Arts, Law, and Pharmacy. Its campus covers 20 acres; the buildings number 13, of which six are of brick and stone. The assets of the University amount to nearly half a million dollars. The present enrolment is 275, the number of instructors 25.

GEORGE HERBERT CLARKE,
Mercer University.

Mercerized Cotton, a process invented by John Mercer, of Lancashire, England, for treating cotton fibre or fabrics. The system was first patented in 1851. The process consists of steeping the cloth in a solution of caustic alkali. The tissue shrinks one fourth and takes more brilliant colors in dyeing than unmercerized cotton goods.

Mercersburg, mēr'sērz-bērg, Pa., borough, in Franklin County; at the terminus of a branch of the Cumberland Valley railroad; about 70 miles southwest of Harrisburg. It was settled in 1730 and was originally called Black Town. It was incorporated in 1831. The borough was enlarged in 1901. It is in a farming section of the county, but has some coal and iron interests. It was formerly noted for its educational institutions, which were under the auspices of the German Reformed Church in America. It is the seat of the Mercersburg Academy, which in 1902 had about 200 students and property valued at \$130,000. Mercersburg was the home of James Buchanan (q.v.). Pop. (1900) 956.

Mercersburg Theology, a school of religious philosophy founded by F. A. Rauch of the German Reformed Church in 1836, his work being taken up by John W. Nevin (q.v.) and Philip Schaff (q.v.). The name comes from the Mercersburg (Pa.) Theological Seminary of the German Reformed Church, whence the teaching of this system spread. The Mercersburg theology urged that the church was not a voluntary society of believers but a historic and spiritual growth — an attitude showing markedly less hostility to the Roman Catholic Church; that old confessions can not express the modern faith of the church; that the sacraments are more than symbols; that church worship should be orderly — hence the 'Liturgy' (1858) and 'Order of Worship' (1866); and that religious education is of prime importance. The Mercersburg movement infused new life into the German Reformed Church. Consult Appel, 'Life of John Williamson Nevin' (1889).

Merchant Marine. See AMERICAN MERCHANT MARINE.

Merchant-marks. See MONOGRAM, TRADE-MARK.

Merchant of Venice, The, a comedy by Shakespeare (1594). It appears on the 'Sta-

tioners' Register' in 1598 and was issued in quarto in 1600, 1637 and 1652. The story of the bonds and that of the caskets are both found in the 'Gesta Romanorum,' but the poet used especially Giovanni Fiorentino's 'Il Pecorone' (Milan, 1558). Inadequate versions of the play by Dryden, Otway and others were seen on the stage till 1741 when Macklin produced the original play.

Mercia, mēr'shī-ā, England, the largest kingdom of the Saxon heptarchy, now comprised in the midland counties on both sides of the Trent from the North Sea to Wales. Mercia was founded by Crida in 585. Like the other Anglo-Saxon kingdoms it had a stormy history, being almost continually at war with some of its neighbors. In 827 it was conquered by Egbert, who united the different kingdoms of England into one. As its frontiers extended to those of the other kingdoms, as well as to Wales, it derived its name from that circumstance (Anglo-Saxon *mearc*, march or boundary). See ENGLAND, *History*.

Mercié, Antonin, ān-tō-nān mēr-sē-ā, French sculptor and painter: b. Toulouse 30 Oct. 1845. He studied under Jouffroy and Falguière; won the first Prix de Rome in 1868; and in 1872 obtained a medal of the first class for his bronze statue of the young David, now in the Luxembourg. His master-piece was 'Gloria victis' (1874), followed by a nude throned Juno (1877), a marble statue of 'Painting' (1890); 'William Tell,' now in Lausanne; monuments to Thiers, Meissonnier (in front of the Louvre), and Jules Ferry, and 'Napoleon' on the Vendôme Column. He painted a Venus, now in the Luxembourg. Since 1891 Mercié has been professor in the Paris Academy.

Mercier, Honoré, Canadian politician: b. St. Athanasie, Quebec, 15 Oct. 1840; d. Montreal, 30 Oct. 1894. He was educated in Montreal at the Jesuit College; then studied law, and, after five years' practice, was elected to the Dominion Parliament in 1872, having made some repute as a Liberal (1862-4) when he was editor of the 'Courrier de Sainte Hyacinthe.' In 1879 he was chosen to the Legislative Assembly and became solicitor-general; and four years later became leader of the opposition, and advantage which he turned to good use by making a combination of Liberals and Clericals. With the help of this fusion party he became premier in 1887.

Mercur, mēr'kēr, James, American soldier: b. Towanda, Pa., 25 Nov. 1842; d. West Point, N. Y., 22 April 1896. He was graduated from West Point in 1866 and commissioned in the engineering corps. He was engaged in surveys made under the government and in 1867-72 was assistant professor of natural and experimental philosophy at West Point, after which he was in command of an engineering corps and in 1876-81 assisted in clearing the New York harbor of the obstructions at Hell Gate. He was professor of civil and military engineering at West Point from 1884 until his death. He published a revised edition of Mahan's 'Permanent Fortification' (1887) and the original works, 'Elements of the Art of War' (1888); and 'Military Mines, Blasting, and Demolitions' (1892).

Mercuric Chloride. See CORROSIVE SUBLIMATE.

MERCURIC CYANIDE—MERCURY

Mercuric Cyanide. See HYDROCYANIC ACID.

Mercury, mēr'kū-rī, the Roman god Mercurius who presided over commerce and gain. See HERMES.

Mercury, in astronomy, the planet nearest the sun. It moves round the sun in 87,969.3 of our mean solar days, at a mean distance of 35,739,200 miles. The eccentricity of its orbit is 0.2056, the inclination of its orbit to the ecliptic is $7^{\circ} 0'.8.2''$, both greater in Mercury than in any other planet; its diameter is about 3,050 miles. It is so near the sun (its greatest possible elongation is 29°) that it can only be beheld under favorable circumstances. Mercury's period of axial rotation is the same as that of its revolution around the sun. It exhibits phases like the moon, and may be seen sometimes after sunset or before sunrise shining with a pale rosy hue. It is best seen in the spring at its greatest easterly elongation, when it is visible for an hour and three quarters after sunset, and at the corresponding westerly elongation in autumn. With a good telescope it can often be seen in the daytime. The transit of Mercury over the sun's disk is not so important as that of Venus, but it is of some interest to astronomers as affording a study of transit phenomena.

Mercury, or **Markery**, a perennial herb (*Chenopodium bonus-henricus*) of the natural order *Chenopodiaceae*. Like other members of its genus, it has mealy foliage, and inconspicuous greenish flowers. The tender shoots which appear in early spring are valued as a substitute for spinach, for which purpose the plant is frequently cultivated. In Europe it is better known as Good King Henry. It will grow in any garden soil with practically no attention.

Mercury, or **Quicksilver**, a metallic element which has been known for many centuries, and which is distinguished from the other metallic elements by the fact that it is liquid at ordinary temperatures. Mercury occurs native in the metallic form, but by far the larger part of it is obtained by distilling the native sulphid, cinnabar (HgS), in a current of air which is regulated so as to burn the sulphur of the sulphid, while leaving the mercury in the metallic state. Cinnabar occurs abundantly at Idria, Austria, at Almaden, Spain, and at New Almaden, near San Francisco Bay, and it is from these sources that the mercury of commerce is chiefly obtained. Mercury freezes at 37.9° F. below zero, and boils, at the ordinary atmospheric pressure (760 mm.), at 675° F. Its specific gravity at 32° F., when compared with water at 39° F., is 13,596. Its specific heat at ordinary temperatures is about 0.0331, and its average coefficient of expansion between 32° F. and 212° F. is 0.00010085 (Fahrenheit scale). The ratio of the specific heat of the vapor at constant pressure to its specific heat at constant volume has been found, experimentally, to be 1.666, which indicates that the molecules of the vapor are monatomic, and that they behave, so far as their collisions among themselves are concerned, as though they were elastic spheres. (See GASES, KINETIC THEORY OF.) Mercury may be freed from dust and dirt by filtering it through leather. To remove tin, lead, and other dissolved metals, the mercury may be left for some weeks in contact with concentrated sul-

phuric acid, and subsequently digested with dilute nitric acid; or it may be several times distilled. Various other modes of purification are also known. The metal is chiefly used, in the arts, for the extraction of gold from crushed ore or fine gravel, the ore being washed by a gentle stream of water over a copper plate which is amalgamated with mercury. The gold particles, being heavy, sink through the water so as to come into contact with the copper plate, where they are held by the mercury in the form of a gold amalgam. (See AMALGAM and GOLD.) In physics, mercury is also greatly used for filling thermometers and barometers, and for many other purposes. It is likewise used in medicine, both in the metallic form and in its compounds with other elements. Metallic mercury, when rubbed up in a mortar with confection of roses until its globules are so fine as to be indistinguishable to the eye, is known as "blue-mass," and is administered in the form of pills, as a cholagogue.

Mercury has the chemical symbol Hg (from "hydrargyrum," its Latin name), and an atomic weight of 200.3 if $\text{O} = 16$, or 198.8 if $\text{H} = 1$. It forms two oxides, each of which gives rise to a series of stable salts. The metal does not oxidize upon exposure to air at ordinary temperatures, but when heated nearly to its boiling point in air or in oxygen, it slowly oxidizes, with the formation of mercury monoxid (or mercuric oxid), HgO . When prepared in this manner the monoxid is crystalline and red, and for this reason it is familiarly known as the "red oxid." The same substance may be prepared in an allotropic form by precipitating a solution of mercuric nitrate by the addition of caustic potash, the monoxid then coming down as an amorphous yellow powder. The red oxid turns black when strongly heated, but recovers its color upon cooling. When heated to redness the monoxid decomposes into metallic mercury and free oxygen. It can therefore be used as a source of oxygen; and it was in fact by heating this substance that oxygen was first discovered, by Priestley. By acting upon the red oxid or upon metallic mercury by excess of nitric acid, mercuric nitrate, $\text{Hg}(\text{NO}_3)_2$, is formed; while if nitric acid is allowed to act upon excess of mercury, mercurous nitrate, HgNO_2 , is obtained. The corresponding sulphates of the metal are obtained by acting upon metallic mercury with sulphuric acid, mercuric sulphate (HgSO_4) or mercurous sulphate (Hg_2SO_4) being obtained, according to the conditions of the experiment. Mercuric sulphid, HgS , which occurs native as the mineral cinnabar, and which is also known as vermillion, is bright red in color, and may be prepared artificially by heating mercury with sulphur, or by passing sulphuretted hydrogen gas through a solution of a mercuric salt. When obtained in the latter way it comes down as a black amorphous powder, which may be brought into the normal red crystalline form by sublimation. Mercury forms two chlorides which are extensively used, especially in medicine. Mercuric chloride (also known as "bichloride of mercury" or "corrosive sublimate"), HgCl_2 , is prepared by heating a mixture of equal parts of mercuric sulphate, HgSO_4 , and common salt, NaCl ; the reaction being $\text{HgSO}_4 + 2\text{NaCl} = \text{HgCl}_2 + \text{Na}_2\text{SO}_4$. The bichloride is fairly soluble in water, and dissolves readily in a solution

of sal ammoniac. It is also quite soluble in alcohol. It crystallizes in the trimetric system, melts at 509° F., and boils at 563° F. It is intensely poisonous, and is one of the most powerful germicides known. It is used in surgery and medicine as an antiseptic and disinfectant, and is occasionally administered internally in very small doses. Mercurous chloride, HgCl (more familiarly known as "calomel," or as the "mild chloride"), is a white powder, insoluble in water, and is greatly used in medicine, both as a cholagogue and otherwise. It may be prepared in various ways, but the usual method is by heating four parts of corrosive sublimate with three parts of metallic mercury; the mercury combining with half of the chlorine of the corrosive sublimate, as indicated by the equation $\text{HgCl}_2 + \text{Hg} = 2\text{HgCl}$. The calomel sublimes, and must then be ground to a fine powder and thoroughly washed, in order to remove any free soluble corrosive sublimate that may not have been decomposed. The so-called "white precipitate," which is obtained when ammonia is added to a solution of corrosive sublimate, has the composition NH_4HgCl . Mercurous oxid, or "black oxid of mercury," Hg_2O , may be obtained as a black powder by digesting calomel with excess of caustic potash. It decomposes into the red oxid and metallic mercury upon exposure to light, or upon being heated to the boiling point of water. Many other compounds of mercury are known, but they are of less importance than the ones here given.

Mercury, Fulminate of. See FULMINATES.

Mercury, Medical Uses of. Mercury uncombined is used only for its bulk. Triturated with some other substance it is valuable medicinally and produces specific mercurial effects, local and constitutional. Such compounds are blue mass (blue pill), mercury with chalk (gray powder), mercurial ointment, and mercurial plaster. All mercurial compounds entering the circulation have a peculiar influence over nutrition. This is especially true of the salts of mercury, such as mercurous chloride or calomel, mercuric chloride or corrosive sublimate, and mercurous iodide or the green iodide of mercury. In small doses, especially in syphilis, they are tonic, improving the quality of the blood; in large doses they impair it, and tend to inflame the mucous membrane of the mouth, stomach, and intestines. Calomel and blue pill are largely used for their laxative effects. Mercury in the various forms of powder, ointment, lotion, and plaster is used to remove body-vermin, relieve itching, and as a remedy in certain skin affections. See POISONS.

Mercury Vapor Lamp. See VAPOR LAMP, THE HEWITT MERCURY.

Mercy, Fathers of, Roman Catholic religious congregation founded on the restoration of Louis XVIII., 1814, and approved of by the Pope (1834) under the title 'Society of the Priests of Mercy.' The object of the society is the conversion of sinners by mission preaching, and the practice of the corporal works of mercy. In 1839 the order founded houses in New York and Saint Augustine, Fla., and the fathers have churches for the French population in Brooklyn and Manhattan. The mother house was originally at Paris, but was removed to Rome in 1903 as a result of the Association Law. Con-

sult Delaporte, 'Vie de Jean-Baptiste Rauzan' (1857).

Mercy-seat (Heb. *Kapporeth*, covering or lid, that is, of the sacred ark in the ancient Jewish tabernacle), an unfortunate and inappropriate term as applied to the cover of the chest or ark containing the two tables of the law, and overspread by the wings of the Cherubim. Between these wings appeared the Shekinah or fiery symbol of the divine presence hovering over the mercy-seat, which consisted most probably of a sheet of the finest gold (Ex. xxv. 17, etc.; xxx. 6; xxxi. 7, etc.). The New Testament writers seem to hold that the term contains by implication the idea of the propitiation (q.v.) (Heb. ix. 5; Rom. iii. 24). The high priest sprinkled on it the blood of the yearly atonement, and some writers think that the term covering as applied to it refers more to the covering of or atonement for sins than to its use in covering the treasures of the ark. In any case the idea of a seat, as if the expression in Psalms xcix. 1, "he sitteth between the cherubims" referred to the earthly tabernacle, is inappropriate. Consult: Pratenias, 'De Judæa Arca' (1727); Werner, 'De Propitiatoria' (1695). See SHEKINAH.

Mercy, Sisters of, a name given to members of several religious communities founded for the purpose of nursing the sick at their own homes, visiting prisoners, attending lying-in-hospitals, superintending the education of females, and the performance of similar works of charity and mercy. Communities of Sisters of Mercy are now widely distributed over Europe and America. There are also religious under the same name connected with the Anglican Church. The term is applied more specifically to the Order of Our Lady of Mercy, a Roman Catholic order founded for the objects above enumerated in Dublin 1827. The first house in America was established in Pittsburgh, Pa., 1843, and from it have sprung 65 convents. Consult 'Leaves from the Annals of the Sisters of Mercy' (1881). See MCAULEY, CATHERINE.

Mer de Glace, *mâr dê glâs*, France, an Alpine glacier on the northern slope of Mont Blanc, with an area of 16 square miles, and an extreme length of about nine miles. It ends as the Glacier des Bois whence flows the Arveyron River, in the valley of Chamouni. From the village of Chamouni the Mer de Glace is easiest visited and Mont Blanc ascended. The glacier has an average flow of two feet a day during summer and autumn.

Meredith, *mêr'ê-dîth*, George, English novelist and poet: b. Hampshire 12 Feb. 1828. He was educated partly in Germany and after returning to England studied law for a time. At 21 he published in 'Chambers' Journal' his first poem, 'Chillianwallah' and having married a daughter of Thomas Love Peacock (q.v.), dedicated to Peacock his first volume of poems (1851). Four years later appeared his first prose work, 'The Shaving of Shagpat: an Arabian Entertainment' (1855); followed by 'Farrina: a Legend of Cologne' (1857). Then in 1859 his great novel, 'The Ordeal of Richard Feverel: a Story of a Father and a Son,' was published. It is concerned with the moral aspects of education and by many critics is classed as his finest work. Less wilful, less obscure in style than much of his later work, it is quite as

MEREDITH — MERGUI ARCHIPELAGO

strong in epigram, and as distinctively original as anything that has followed. Succeeding works were 'Evan Harrington' (1861) in which more humor appears than in many of his other books; and 'Modern Love and Poems of the English Roadside' (1862). 'Modern Love' is a sonnet sequence which though sharply criticised, is frequently named as Meredith's highest attainment in poetry. Later works of his are 'Emilia in England,' now called 'Sandra Belloni' (1864); 'Rhoda Fleming' (1865); 'Vittoria,' a sequel to 'Emilia in England' (1866); 'The Adventures of Harry Richmond,' perhaps the most generally liked of all his novels (1871); 'Beauchamp's Career' (1875); 'The House on the Beach' (1877); 'The Case of General Opie and Lady Camper' (1877); 'The Tale of Chloe' (1879); 'The Egoist' (1879); 'The Tragic Comedians' (1880); 'Poems and Lyrics of the Joy of Earth' (1883); 'Diana of the Crossways' (1885); 'Ballads and Poems of Tragic Life' (1887); 'A Reading of Earth,' verse (1888); 'One of our Conquerors' (1891); 'The Empty Purse,' verse (1892); 'Lord Ormont and his Aminta' (1894); 'The Amazing Marriage' (1895); 'Comedy and the Uses of the Comic Spirit' (1897); 'Odes in Contribution to the Song of French History' (1898); 'Poems,' a collected edition (1899). For many years after his work was well known to a few cultivated readers, the world at large was wholly ignorant of it. About 1885 it began to attract an increasing number of English readers and the efforts of a few young American critics the next year revealed Meredith to Americans, and won for him a moderate popularity here. He still remains unread by the general public where his subtlety, wilfulness, and rugged style will always repel, but his audience if not large is appreciative and discriminating. If not the greatest living English novelist to-day, he is distanced only by Thomas Hardy. Consult: Le Gallienne, 'George Meredith: Some Characteristics' (1890); Lynch, 'George Meredith' (1891); Cross, 'The Development of the English Novel' (1899); Brownell, 'Victorian Prose Masters' (1901).

Meredith, Louisa Anne Twamly, Australian author and artist: b. Birmingham, England, 20 July 1812; d. Hobart Town, Tasmania, 21 Oct. 1895. She had already published a volume of verse (1835); and 'The Romance of Nature,' illustrated by herself (1836), before she married her cousin Charles Meredith (1839) and removed to Australia, whence they went to Tasmania five years later. She continued her literary activity till the end of her long life, and for many years before her death had been the most prominent Tasmanian author. Among her many books, often illustrated by herself are: 'My Home in Tasmania' (1852); 'Over the Straits' (1860); 'Tasmania: Friends and Foes, Feathered and Furred' (1880). Her prose works were popular in Australia and had also a circulation in England and this country; and her verse, of which she published several collections, was at once pleasing and unpretentious.

Meredith, Sir William Ralph, Canadian jurist: b. Westminster, Ont., 31 March 1840. He was educated in the University of Toronto and was admitted to the bar in 1861 when he established a law practice in London, Ont. He was a member of the Ontario legislature 1872-94 and became queen's counsel in 1876. In 1894

he was appointed chief justice of the Court of Common Pleas which office he still holds, and he is chancellor of the University of Toronto. He was knighted in 1896.

Merganser, or **Fish-duck**, a duck of the genus *Mergus*, distinguished by the slender cylindrical bill, the upper mandible terminating in a strong hooked "nail," and the margins presenting the appearance of rows of tooth-like processes. The most widely distributed is the red-breasted (*Mergus serrator*), known as shel-drake in America where it is less numerous than in the Old World. The goosander (*Mergus merganser*) and the nun or smew (*M. albellus*) are familiar European and Asiatic species, while the hooded merganser (*Lophodytes cucullatus*) or sawbill is familiar in North America. The mergansers feed chiefly upon fishes, and swim and dive after their prey with great ease and dexterity. They are essentially northern in their distribution, breed in the far north, and migrate southward on the approach of the colder season. The nest is built of grass and roots, and is lined with down. It is usually placed in a hollow of the bank near water; but some species prefer the greater security of a hollow tree. The flesh is coarse and rank. Eight or ten species are known in various parts of the world. The female alone incubates, but the male watches near the nest. From eight to fourteen eggs are laid, and the young enter the water as soon as they are hatched.

Mergenthaler, mër'gan-tä-ler, **Ottmar**, American inventor: b. Württemberg, Germany, 10 May 1854; d. Baltimore 28 October 1899. He was a watchmaker by trade; came to the United States at 18; entered the employ of the United States government at Washington, where he kept clocks and electrical bells throughout government buildings in order; improved apparatus used in the signal service; and in 1876 removed to Baltimore, where he devoted himself to perfecting a type-setting machine. On this he spent several years, his scheme going through four stages, the last of which was the linotype (q.v.). When he had patented this machine he had much difficulty in introducing it. It was perfected by the addition of the Rogers spacer, brought its inventor large profits, and is now in very common use in large printing establishments. Mergenthaler also invented a basket-making machine.

Merger, (1) in law, the sinking or obliteration in conveyancing of lesser estates or property, into greater ones; or the consolidation of two or more estates; (2) a term used in financial or business circles, meaning the consolidation or combination of a particular class of manufactories, railroads or other business interests; generally in the nature of a trust.

Mergui (mër-gé') **Archipelago**, a chain of islands in the Bay of Bengal, off the coast of Tenasserim in Burma, the more northern ones forming a part of the British district of Mergui; area, 10,000 square miles. They are generally covered with trees, and present many picturesque features, rising at some points to the height of 3,000 feet. The inhabitants belong to a race called Selungo. They give little attention to agriculture, obtaining a sustenance mainly by fishing, pearl gathering, and selling edible birds' nests. The Selungos are peaceful and industrious, but few in number. The adjoining seas

abound in fish and excellent oysters; pearls of good quality and lustre are found. The wild animals include tigers, rhinoceroses, and deer. Pop. (1901) 88,667.

Merida, mā'rē-dā, Mexico, city, capital of Yucatan, about 25 miles from the port of Progreso, on the Mexican Gulf, with which it is connected by a railroad opened in 1880. It has a Moorish aspect generally, having been built at a time when that style prevailed in Spanish architecture. It has manufactures of cotton goods, cigars, panama hats, leather, soap, etc., and a considerable trade in sisal hemp and other articles. The city contains a number of fine squares, the principal of which, the Plaza Mayor, 600 feet square, stands in the centre. The square is bounded by the cathedral, bishop's palace, government house, and private dwellings. The cathedral has a most imposing appearance, being surmounted by well-proportioned domes, pinnacles, and turrets. Merida was founded in 1542. Pop. (1903) 40,500.

Merida, Venezuela, town, capital of the state of Los Andes; 5,290 feet above sea-level, at the foot of the Sierra Nevada de Merida, and 70 miles south of Lake Maracaibo. It was founded in 1558 by Juan Rodriguez Saurez. It was almost wholly destroyed by an earthquake in 1812. It is the seat of a bishop, contains one of the two National universities of Venezuela, and has several high schools. Its manufactures are carpets, woolen and cotton goods. Pop. about 11,862.

Meriden, Conn., city, in New Haven County; on branches of the New York, New Haven & Hartford railroad; about midway between Hartford and New Haven. To the west are hills in which there are many springs. Originally the town of Meriden was a part of Wallingford until 1806 when the town of Meriden was incorporated. In 1867 it was granted a city charter. It is situated in an agricultural region, but the city is noted for its large number of manufactories. Some of the principal manufactures are cutlery, silver and plated ware, steel pens, hardware, machinery, screws, vises, glassware, cut glass, malleable iron, bronzes, firearms, brass castings, curtain fixtures, gas and kerosene fixtures, self-playing attachments for pianos and organs, woodenware, tinware, granite, agate-ware, lamp trimmings, etc. The shipments are principally manufactured articles, fruit, vegetables, and tobacco.

The educational institutions are the public and parish schools, a high school and the Curtis Memorial Library. It has the Curtis Home for Orphan Children and Aged Women, the Connecticut School for Boys, and the Meriden Hospital. Lake Merimere, a beautiful body of water, is near, and another attraction is Hubbard Park, area 900 acres, within which are the Hanging Hills, peculiar elevations which are from 100 to 1,000 feet above sea-level. The government is administered under a charter of 1897. The mayor, who holds office two years, appoints fire and park commissioners board of taxation and apportionment, police and board of public works. The council elects the health officer, board of compensation, tax collector, plumbing inspector, boiler inspector and fire marshal. The treasurer, sheriff, clerk, and auditor are chosen by popular vote. Pop. (1890) 21,652; (1900)

24,296. Consult: Perkins, 'Historical Sketches of Meriden.'

Meridian, Miss., city, county-seat of Lauderdale County; on the Mobile & Ohio, the New Orleans & Northeastern, and the Southern R.R.'s; about 90 miles east of Jackson. Meridian is one of the oldest places in the State. It was a Confederate supply depot during the Civil War until 1864 when it was attacked by General Sherman. From 14 February until the 20th he destroyed the store houses, railroads, and took possession of the supplies. The city is surrounded by fine farm land on which a large quantity of cotton is raised. The chief industrial establishments are cottonseed-oil mills, cotton mills, lumber mills, railroad shops, cotton-gins and cotton compresses. Meridian is the trade centre for a considerable section of country; large shipments of cotton and lumber are made annually. It is the seat of the East Mississippi Female College (M. E.), founded in 1867 and opened in 1869. It has the Lincoln School (Congregational) and the Meridian Academy (Methodist Episcopal South) both for colored students. Pop. (1890) 10,024; (1900) 14,050.

Meridian (Miss.), **Expedition to**. In January 1864 Gen. Sherman concentrated two divisions of 10,000 each at Vicksburg under Gens. McPherson and Hurlbut, and 3 February marched eastward with the purpose of destroying Meridian, 150 miles distant, as a railroad centre, and possibly penetrating to Selma, Ala., or, if the opposing forces did not seem too strong at Mobile, to turn southward from Meridian and attempt the capture of that city. Gen. Sooy Smith was to co-operate with a cavalry force from Memphis; Gen. Dodge, in command at Pulaski, Tenn., was to hold Logan at Bellefonte, Ala., for a diversion toward Rome, Ga.; and Gen. Thomas was to demonstrate toward Dalton to prevent troops being sent by Gen. Johnston to Sherman's front.

Sherman entered Jackson on the 6th, after heavy skirmishing with cavalry. Decatur was reached on the 12th. Sherman arranged to spend the night at a farm house. By mistake the regiment on guard had moved forward. The house was attacked, and just as Sherman, his clerks and orderlies were climbing into a corn-crib at the back of the house to defend themselves, the regiment which had gone on by mistake came rushing back and saved Sherman and his headquarters force from capture.

Meridian was taken the 14th, the Confederate force, under Gen. Leonidas Polk, being much less than Sherman's, withdrawing toward Demopolis. The arsenal, extensive storehouses, and cantonments were burned. The work of destroying the railroads centring at Meridian began on the 16th, 60 miles being rendered utterly useless to the north and east, and 55 miles toward Mobile. This destruction was of the most systematic and thorough character; 10,000 men worked at it for five days; 61 bridges and culverts, and more than a mile of trestles over swamps were burned; all rails were rendered useless. This object of the expedition was fully gained, as Meridian was not wholly restored as a railroad centre during the war. Thereafter, the transporting of supplies eastward from the State of Mississippi was seriously interrupted for a long time, and was greatly impeded up to the close of the war, while

MERIDIAN—MERINO

all military operations which required railroad facilities were rendered extremely difficult.

The expedition, however, was not as successful as had been hoped. The Confederates, by the exercise of great energy in the face of many difficulties, so strengthened Mobile as to forbid an advance in that direction. Sherman, not receiving the cavalry support under Gen. Sooy Smith which he had reason to expect from Memphis, was unable to push on to Selma, Ala., one of the great manufacturing cities and storehouses for military supplies of the Confederacy. Smith, in turn, had been unavoidably detained, and Sherman returned to Vicksburg, reaching its vicinity 26 February. His command had marched between 300 and 400 miles, had crossed Mississippi, and inflicted well-nigh irreparable military damage; but had been prevented from carrying out his full programme by Confederate activity in assembling forces in his extreme front.

H. V. BOYNTON.

Meridian, one of the innumerable imaginary lines on the surface of the earth that may be conceived of as passing through both poles and through any other given place, and serving to settle the longitude of places, and thus to mark their exact position. There are also corresponding lines called astronomical or celestial meridians, which are imaginary circles of the celestial sphere passing through the poles of the heavens and the zenith of any place on the earth's surface. These correspond exactly to the geographical meridians, that is, the celestial is exactly above the geographical meridian of any place. Every place on the globe has its meridian, and when the sun arrives at this line it is noon or midday, whence the name (Latin, *meridianus*—*medius*, middle, and *dies*, day). (See LONGITUDE.) The inconvenience arising from having a fixed meridian in different countries is sufficiently obvious, and geographers, navigators, and astronomers have all found it frequently a source of confusion. After years of fruitless discussion the question of a reference or first meridian for the world came before an international conference held at Washington, 1 to 22 Oct. 1884. There, although the representatives of France and Brazil dissented, it was agreed to recommend the meridian of Greenwich both as the astronomical and as the geographical reference meridian of the world, longitude to be reckoned east and west from this up to 180°. At the same time it was advised that the astronomical day should begin at midnight, mean Greenwich time, the hours for astronomical purposes being reckoned as before from 0 to 24. This arrangement began on 1 Jan. 1885. Previously many foreign map-makers had accepted the meridian of Greenwich as first meridian, Germans and Americans apparently having no jealousy of Great Britain in regard to the matter. The change of time has had some importance for astronomers, but ordinary civil time is still computed much as before. The zone system of reckoning standard time was adopted in the United States in 1883 and in Australia in 1895. In the former country there are four zones: the Eastern, taking time from the meridian of 75° W. (5 hrs. slow on Greenwich time); the Central, with standard meridian 90° W. (6 hrs. slow); the Mountain, 105° W. (7 hrs. slow); and the Pacific, 120° W. (8 hrs. slow). There are three Australian zones: Queensland, New South Wales, Victoria, and Tasmania, with 150°

E. (10 hrs. fast) as standard; South Australia, with 135° E. (9 hrs. fast); and Western Australia, with 120° E. (8 hrs. fast). Other standards adopted with reference to Greenwich are: 15° E. (1 hr. fast) for Mid-Europe; 22½° E. (1½ hrs. fast) for Cape Colony; 30° E. (2 hrs. fast) for Natal; 135° E. (9 hrs. fast) for Japan; and 172½° E. (11½ hrs. fast) for New Zealand.

Meridian Circle, in astronomy, an instrument used in observatories to combine the functions of a transit instrument and of the old mural circle. A vertical circle is carried on the axis of the transit instrument and revolves with it, its divisions being read by micrometer microscopes mounted solidly on one of the piers. In this way both co-ordinates of the position of a heavenly body, its right ascension and declination, are determined at the same meridian passage—a great saving of time over the old method with the instruments.

Meridian Conference, an international convention, held in October 1884, at Washington, D. C., for the purpose of adopting a common prime meridian from which to reckon longitudes, and for other kindred purposes. See MERIDIAN.

Mérimée, mǎ-rē-mǎ, Prosper, French author: b. Paris 28 Sept. 1803; d. Cannes 23 Sept. 1870. He was educated at the Collège Henri IV. and studied law though he never practised it. Under the pseudonym "Joseph Lestrangé" he published in 1825 'Theatre de Clara Gozul, Comedienne Espagnole,' an assumed translation from the Spanish of eight prose comedies, but in reality his own work. From that time onward he continued to publish works at frequent intervals and at the same time had an official career of importance. Following the revolution of July 1830, he was made secretary to the ministers of commerce and marine, in 1831 was appointed inspector of ancient monuments, in 1844 became a member of the Academy, and senator of France in 1853. He was a commander of the Legion of Honor in 1860. Beside publishing several important works connected with his duties as inspector of ancient monuments he was the author of 'Colomba' (1840), a very popular novel of the Corsican vendetta; 'Carmen' (1847), a romance upon which the famous opera 'Carmen' by Bizet is founded; 'Lettres à une Inconnue,' his most famous work (1873); 'Lettres à une autre Inconnue' (1875); 'Lettres à Panizzi' (1881); 'Une Correspondance Inédite' (1896). The four works last named are Mérimée's most characteristic writings revealing him as a most loyal devoted friend. They differ widely from his other works, which though often brilliant are hard and unsympathetic, while these are tender and romantic. As a master of style Mérimée had few equals in his day. Consult: Filon, 'Mérimée et ses Amis' (1894); Haussonville, 'Mérimée' (1888); Tourneux, 'Prosper Mérimée, ses Portraits, ses Dessins, etc.' (1879).

Mer'ington, Marguerite, American playwright: b. England about 1860. Among her dramas are 'Daphne,' 'Captain Letterblair,' 'Love Finds the Way.'

Merino, a woolen or worsted fabric, introduced about 1826, and so named because made from the wool of merino sheep. See WOOL.

MERINO SHEEP—MERMAID

Merino Sheep. See **SHEEP.**

Merit, Order of, a British order instituted by King Edward VII., 26 June 1902, to confer distinction on persons in military, scientific, artistic and professional circles. The order follows the Order of the Bath. Twelve persons were decorated with the new order during 1902-3.

Merit System, The. See **CIVIL SERVICE REFORM.**

Merivale, mēr'i-vāl, Charles, English historian and ecclesiastic; b. Barton Place, Devonshire, 8 March 1808; d. Ely 27 Dec. 1893. He was educated at Cambridge, took orders in the English Church, was rector of Lawford, Essex, 1848-69, and dean of Ely from 1869. He published 'The Fall of the Roman Republic' (1853), which forms the first part of his popular 'History of the Romans under the Empire' (latest ed. 1890); 'General History of Rome' (1875); 'Lectures on Early Church History' (1879); etc. Consult, 'Autobiography and Letters' edited by his daughter (1899).

Merivale, Herman, English statesman and political economist; brother of Charles; b. Dawlish, Devonshire, 8 Nov. 1806; d. London 9 Feb. 1874. He was educated at Oxford, where he was professor of political economy 1837-42. He was under-secretary for the colonies, 1848-59 becoming perpetual under-secretary for India in 1859. He wrote 'Colonization and Colonies' (1841), a much valued work; 'Historical Studies' (1865); 'Memoirs of Sir Philip Francis' (1867).

Merivale, Herman Charles, English author; b. London 1839. He was educated at Harrow and Oxford, became a barrister of the Inner Temple in 1864 and edited the 'Annual Register' 1870-80. Among his publications are: 'The White Pilgrim and Other Poems' (1875); 'The Cynic' (1882); several plays; 'The Whip Hand' (1884); 'The Dove' (1888). He was a son of J. H. Merivale.

Meriwether, Lee, American lawyer, social reformer, and author; b. Columbus, Miss., 25 Dec. 1862. Having obtained a secondary education at Memphis, Tenn., he there published the 'Free Trader' with a brother, Avery, in 1881-3, and in 1885-6 toured Europe afoot from Gibraltar to the Bosphorus for study of the condition of Continental workmen and of the protective tariff. He was appointed by the secretary of the interior to write for the United States Labor Bureau a report on the 'Condition of European Labor,' published in the annual report of the bureau for 1886. In 1886-9 he was employed as a special agent of the department of the interior for which he made investigations of labor in the United States and the Hawaiian Islands, and in 1891 visited the island prisons of the Mediterranean. He was admitted to the bar in 1892, and in 1893 entered practice at St. Louis. In 1889-90 and 1895-6 he was labor commissioner of Missouri. His reports on municipal government and street-railway franchises led to his nomination in 1897 for the mayoralty of St. Louis on the Democratic ticket. He was defeated at that time and also in 1901, when he was candidate of the Public Ownership party. Besides his various reports, he has published 'A Tramp Trip: How to see Europe on Fifty Cents a Day' (1887); 'The Tramp at

Home' (1890); 'Afloat and Ashore on the Mediterranean' (1892), and other works.

Merle d'Aubigné, Jean Henri. See **D'AUBIGNÉ, JEAN HENRI MERLE.**

Merlin, mēr'lin, a semi-legendary British prophet and magician, supposed to have flourished toward the end of the 5th century. The accounts of him are hopelessly mixed with fiction. He was said to be the son of a demon and the daughter of a British prince, and was brought up at Caer-Merlin, a city supposed to be the modern Carmarthen. He received from his father the power of working miracles and was the greatest sage of his time, the counsellor and friend of English kings. Vortigern, according to the legend, on the advice of his magicians, had resolved to build an impregnable tower for security against the Saxons; but the foundation was scarcely laid when the earth opened by night and swallowed it up. The magicians informed the king that to give firmness to the foundation he must wet it with the blood of a child born without a father. After much search the young Merlin was brought to the king. Merlin disputed with the magicians and showed them that under the foundation of the tower was a great lake, and under the lake two great raging dragons, one red, representing the British, one white, representing the Saxons. The earth was dug open, and the dragons began a furious battle; whereupon Merlin wept, and uttered prophecies respecting the future state of England. Merlin is a character in Tennyson's 'Idylls of the King.' A collection of the prophecies attributed to him appeared at Paris in 1498, at London in 1529 and 1533, at Venice, 1554. They can be traced back to about 1360. His prophecies were published at Edinburgh in 1615 and contain also those ascribed to the Cambrian or Welsh Merlin.

Merlin, or Stone-falcon, a small and handsome European falcon (*Æsalon regulus*) pre-eminently blue, known throughout the temperate parts of the old world, and very similar to the American pigeon-hawk (q.v.). It is fierce and courageous, and is trained in falconry for the pursuit of the birds that form its natural prey.

Mermaid, a mythical being living within and under the sea, having the form of a woman above the waist and that of a fish below it. They are usually described as having great personal charms, and as using these for the purpose of luring imaginative and amorous men to destruction by enticing them into the depths of the sea; and, as a correlative, they are sometimes represented as securing their own destruction by quitting the sea, through marriage with some favored human husband by which they magically obtain temporarily a complete human form and soul, but always end in bringing disaster to one or both of the sacrilegious pair. Mermen are also occasionally heard of, but take an unimportant part in the legendary lore of the sea.

This mediæval notion is doubtless a survival of the primitive fancies, half fearful, half poetic, which created the classic conceptions of tritons, nereids, and the like. Shakespeare wrote (*Ant. and Cleop.*, II., 2, 211):

Her gentlewomen, like the Nereides,
So many mermaids, tended her.

All of these ideas probably arose from a mixture of observed human resemblances in certain marine animals with purely mystical fancies.

MERMAID'S GLOVE — MEROË

which peopled the ocean with similitudes to terrestrial creatures. Primitive men have everywhere derived a large part of their sustenance from the natural products of the waters; and always the vastness and mystery of the sea, full of strange creatures and incomprehensible phenomena, have powerfully affected the imagination of the ignorant and superstitious. To this day the ocean is more familiar and more important in the life of many isolated peoples, who dwell upon its margin and derive their support almost exclusively from it, than is the land; and they invest it and everything it contains with a wondering regard which the inlander can neither share nor understand. To these, even in civilized regions (as on the coast of Ireland or the Hebrides) mermaids remain only one of many present realities, herding sea-cattle and lying in wait for unwary humanity as surely as when sea-horses raced over the Ægean waves with the car of Poseidon or the Sirens tempted the mariners of ancient Greece. In one form or another such stories have been rife in the folk-lore of all maritime peoples since prehistoric times; and, although not so widespread, the belief in mermaids, and their kith and kin, is still a matter of firm faith with hosts of persons in all parts of the world. Folk-lore abounds in evidence of this.

The physical basis for these notions rests upon the resemblance which some marine animals bear to human beings when seen at a distance and in certain attitudes. Such, in northern countries, are various seals, which formerly abounded upon the coasts of western Europe, and still are to be seen in the less frequented spots. They have a way of lifting their round heads and shoulders from the water, with a queer human intelligent look upon their faces, and hugging their young to their bosoms with motherly affection. Impressed with this resemblance, easily turned into a story to beguile a long winter evening or to amuse a child, and growing with imaginative repetitions, the northern peoples were quick to believe the similar and more elaborate stories brought to them by early voyagers from the Mediterranean, and so the tales grew and changed into the rich folk-lore of the coasts of the North Sea.

The southern stories, embellished by classic culture into the sea-myths of Neptune, Proteus and the sea-nymphs of old, and descending into the mermaids and mermen of mediæval folk-lore, yet alive around the Mediterranean and Oriental seas, and among sailors generally, probably have their root in the aspect of the East Indian and African dugongs (q.v.). Near at hand these uncouth monsters would never be mistaken for human beings; but seen at a distance, by fearful and wondering voyagers along the coast, such an error might easily happen, for they frequently stand upright among the weedy shallows of the coasts, perhaps draped with loosened vegetation like long hair, and holding to their breasts a young one who nurses from pectoral mammae much as a human baby would do. Such reports, brought back to the enquiring poetic minds of Greece, might easily blossom into the tales of sea-mythology which formed so large and real a part of the popular belief as well as of the legendary lore of the classic age of India, Persia and the Mediterranean peoples. The fish-gods of the Phœnicians and other idolaters are closely related.

From this has come down to us the extensive and varied use of mermaids and mermen in heraldry. "In French heraldry," says Robinson, "the mermaid is called the Siren; in German she has two tails; in the Italian she carries a harp; and in many cases in each country she is crowned. In England it is a very ancient crest, and among others the lords Byron, the earls of Portsmouth . . . and many others display the sea-maiden in their armorial bearing. With her comb and looking-glass she smiles at us from the shields of the Holmes, Ellises, Lapps; and as a supporter holds up the arms of the Viscounts Boyne and Hood, the earls of Howth and Caledon, and is borne by the heads of the families of Sinclair of Rosslyn, and Scott of Harden. Two mermaids crowned are the supporters of the Boston arms."

Artificial mermaids, claiming to be preserved realities, have formed a part of the stock of curiosities of wonder-shows since time immemorial; and most of those exhibited since the days of Barnum have been the products of Japanese ingenuity.

ERNEST INGERSOLL.

Mermaid's Glove, a large branching sponge (*Halichondria palmata*), bearing a remote resemblance to a glove with extended fingers, frequently found on North Atlantic beaches. The same name is applied to the objects more usually called deadmen's fingers (q.v.).

Mermaid's Head, a globose sea-urchin, as one of the heart-urchins.

Mermaid's Purse, the egg-case of the skate (or shark), which is often cast up empty on the shore.

Merman. See MERMAID.

Mero, or **Merou**, a West Indian name for a jewfish (q.v.).

Merodach, mēr'ō-dāk, or **Bel-Merodach**. See BEL.

Meroë, mēr'ō-ë, Egyptian Sudan, a city and state of ancient Ethiopia, in the north-eastern part of Africa. The city is still represented by ruins and pyramids near Kabati on the Nile north of Khartum, and the state forms the district often spoken of as the Isle of Meroë, extending southeast to Abyssinia, and in the northwest forming a part of Nubia. It was distinguished for its mineral and cereal wealth, and at an early date was the centre of an active and varied commerce including the great caravan trade between Ethiopia, Egypt, Arabia, northern Africa and India. The government was in the hands of a caste of priests, who chose a king who was obliged to live and act according to certain prescribed rules. The priests could sentence the king to death in the name of the gods, and he was forced to submit. The priests were of a lighter complexion than the other inhabitants, and may have come from India. Ergamenes, king of Meroë in the 3d century B.C., during the reign of Ptolemy II, in Egypt, first made himself independent of this oppressive priesthood by murdering the priests in the golden temple. Meroë and Axum (in Abyssinia), which appears to have been a colony of Meroë, remained the centre of the southern commerce till the time of the Arabians. The existing monuments of their architecture, and many other vestiges, exhibit an advanced religious and social cultivation.

MEROSTOMATA — MERRILL

Merosto'mata, a sub-class of arthropods, allied to the *Crustacea*, and represented by only a single survivor (the horsefoot crab), but including a large series of fossil forms which flourished in the Palæozoic Age. They were somewhat scorpion-like in form, although sometimes of gigantic size, and ranked between the superior trilobites and inferior arachnids. The Merostomata are characterized by having six pairs of ambulatory limbs about the mouth, the first of which terminate in some, if not in all, cases in chelicerae. The others serve as organs of locomotion, and their coxal joints for prehension and mastication. The prevailing opinion is that the body is divided into two parts (cephalothorax and abdomen) instead of three (head-shield, thorax and abdomen). The sub-class comprises three orders, *Xiphosura*, the horsefoot crabs (q.v.), several species of which still exist; the *Synxiphosura*, Silurian and Cambrian fossil forms; and *Eurypterida* (see EURYPTERUS). Consult Packard, 'Zoology' (1897), and Zittel-Eastman, 'Text-book of Paleontology,' Vol. I. (1900), which contains an extensive bibliography.

Merovingians, mēr-vin'jī-anz, the first dynasty of Frankish kings which ruled in the northern part of Gaul, since called France. They derived their name from Merowig (Merovæus), the grandfather of Clovis. They ruled from 496 till 752, when they were supplanted by the Carolingians. See FRANCE.

Merriam, mēr'ī-am, Clinton Hart, American biologist and author: b. New York city, 5 Dec. 1855. He was graduated from Yale in 1877 and from the College of Physicians and Surgeons in New York in 1879, and practised medicine, 1878-85. He was United States Bering Sea commissioner in 1891 and visited Alaska in the interest of fur seal investigations. He has held various commissions from the government in the field of biology and has made explorations in its interest in the far West. He has written: 'Birds of Connecticut' (1877); 'Results of Biological Survey of San Francisco Mountain Region and Desert of Little Colorado in Arizona' (1890); 'Life Zones and Crop Zones of the United States' (1898); etc.

Merriam, Florence. See BAILEY, FLORENCE MERRIAM.

Merriam, Henry Clay, American soldier: b. Houlton, Maine, 13 Nov. 1837. He was graduated from Colby University, and began the study of law; but in 1862 entered the Union army as captain in a Maine regiment. He was at the battle of Antietam in 1862, and organized the colored troops in 1863, being lieutenant-colonel of the Louisiana Native Guard (a negro regiment) at the close of the war; he led the assault on Fort Blakely 9 April 1865, and obtained a medal of honor from Congress for gallant conduct. In 1866 he was appointed major in the regular United States army, and rose to the rank of brigadier-general in 1897 and major-general of volunteers in the Spanish War, 1898. He served in many expeditions against the Indians, and protected American citizens in the valley of the Rio Grande in the revolutionary troubles (1873-6). In 1898 he was commander of the departments of the Columbia and California, and organized, equipped and forwarded the troops to the Philippines; and in 1899 was sent to the Philippines in command of

the army of occupation. In January 1900, he was placed in command of the Department of the Colorado, and in 1901 was retired from active service. He is the inventor of the Merriam infantry pack.

Merriam, William Rush, American financier: b. Wadham's Mills, N. Y., July 1849. He was graduated from Racine College, Wisconsin, in 1871 and entered the First National bank of St. Paul where he was cashier in 1873. In 1880 he was president of the Merchants' National bank there and in 1882 became a member of the State legislature of Minnesota and was speaker in 1886. He was elected governor of Minnesota in 1889 and was director of the United States Census in 1898-03.

Merrick, mēr'ik, Leonard, English novelist: b. Belsize Park, London, 21 Feb. 1864. He was educated at Brighton College, and among his novels, several of which have been reprinted in this country, are: 'Mr. Bazalgette's Agent'; 'The Man Who Was Good'; 'Cynthia: a Daughter of the Philistines'; 'When Love Flies Out of the Window.' He is also the author of several plays.

Merrifield, mēr'ī-fēld, Webster, American educator: b. Williamsville, Vt., 27 July 1852. He was graduated from Yale in 1877 and was an instructor there 1879-83. From 1884 to 1891 he was professor of Greek in the University of North Dakota, becoming professor of political economy and president of the institution in 1891.

Merrill, mēr'il, George Edmands, American Baptist clergyman and educator: b. Charlestown, Mass., 19 Dec. 1846. He was graduated from Harvard in 1869, and from the Newton Theological Seminary in 1872. Entering the Baptist ministry, he was pastor at Springfield, Mass. (1872-7); at Salem, Mass. (1877-85); at Colorado Springs (1885-7); and at Newton, Mass. (1890-9). In 1899 he was called to the presidency of Colgate University, Hamilton, N. Y., where his administration has been of a constructive nature, improving the standard and awakening interest in many new lines of college activity. He has written 'Story of the Manuscripts' (1881); 'Crusaders and Captives' (1890); 'The Reasonable Christ' (1893); 'The Parchments of Faith' (1895).

Merrill, Lewis, American soldier: b. New Berlin, Pa., 28 Oct. 1834; d. Philadelphia 27 Feb. 1896. He was graduated from West Point in 1855, and at the outbreak of the Civil War was appointed colonel of a volunteer cavalry regiment and served with distinction through the war. He was active in warfare with the Indians and performed the notable service of breaking up the Kuklux Klan in 1868, which was recognized by Congress after some delay by promotion to the rank of lieutenant-colonel of cavalry.

Merrill, Selah, American Congregationalist clergyman and archaeologist: b. Canton Centre, Conn., 2 May 1837. He was educated at Yale and at the New Haven Theological Seminary and was ordained to the ministry in 1864 when he entered the Federal army as chaplain. He held pastorates in Leroy, N. Y., and in San Francisco, and was for a time professor of Hebrew at Andover Theological Seminary. In 1882-6, 1891-4 and since 1898 he has been United

MERRILL — MERRY

States consul at Jerusalem and has made valuable archaeological researches and discoveries there. He has written: 'East of the Jordan' (1881); 'Galilee in the Time of Christ' (1881); 'The Site of Calvary' (1885); etc.

Merrill, Stephen Mason, American Methodist bishop: b. Jefferson County, Ohio, 16 Sept. 1825. He studied for the ministry and was ordained by the Ohio Conference in 1846, and in 1868-72 was editor of the 'Western Christian Advocate.' In 1872 was appointed bishop. He has published: 'Christian Baptism'; 'Union of American Methodism'; 'Sanctification' (1901); 'Miracles' (1902); etc.

Merrill, William Emery, American military engineer: b. Fort Howard, Wis., 11 Oct. 1837; d. near Edgefield, Ill., 14 Dec. 1891. He was graduated from West Point in 1859 and for a year prior to the outbreak of the Civil War was assistant professor in engineering at West Point. He went to the front in 1861, and served with distinction at Yorktown, Chickamauga, Missionary Ridge and other famous battles and in 1864-5 had charge of the railroad which supplied the armies in Georgia and Tennessee and was brevetted colonel for his services. After the war he served as chief engineer on the staff of General Sherman and was engaged in western surveys and the improvement of rivers. He was in charge of the improvement of the Ohio River at the time of his death which occurred on a railroad train. He wrote 'Iron Truss Bridges for Railroads' (1870) and 'Improvement of Non-Tidal Rivers' (1881).

Merrill, Wis., city, county-seat of Lincoln County; on the Wisconsin River, and on the Chicago, Milwaukee & Saint Paul railroad; about 145 miles north of Madison. It was settled in 1875 and incorporated in 1880. It is in a part of the State where the chief industries are connected with lumbering. Merrill has manufacturing establishments for shingles, laths, planed lumber, sawed lumber, sash, doors, and blinds, clapboards, lumber for interior finish, flooring, etc. It has a high school, an opera house, a court-house which cost about \$100,000, and the T. B. Scott Public Library. Pop. (1890) 6,809; (1900) 8,537.

Merrimac, mēr'ī-māk, a river of New Hampshire, which has its source at Franklin where the Pemigewasset and Winnipissaukie rivers unite. The Winnipissaukie is the outlet for the lake of the same name; the Pemigewasset has its rise in the northern part of Grafton County, in the White Mountains. The Merrimac flows nearly due south into the State of Massachusetts when it turns, continuing its course east, then northeast to the Atlantic Ocean. The mouth of the river is a tidal estuary which is navigable for steamers of good size. At the entrance is a sand bar which is constantly changing, and which is a hindrance to navigation. The river is navigable for small steamers as far as Haverhill. The extensive water-power of the Merrimac made it one of the most important rivers of the country when the chief motive power for machinery was water. The largest cotton-mills of the country were erected on its banks, and many woolen mills, carpet mills, and other manufactories. Newburyport is at the mouth of the river. Other important places on its banks are Haverhill,

Lawrence, and Lowell, in Massachusetts, and Nashua, Manchester, and Concord in New Hampshire. The length from the source of the Pemigewasset to the ocean is 183 miles.

Merrimac, The, a frigate of the United States navy. See MONITOR and MERRIMAC, THE.

Merriman, mēr'ī-man, **Henry Seton**. See SCOTT, HUGH STOWELL.

Merriman, Mansfield, American civil engineer: b. Southington, Conn., 27 March 1848. He was graduated from Yale in 1871 and in 1872-3 was assistant engineer in the United States corps of engineers. He was instructor in civil engineering at Sheffield Scientific School, Yale, in 1875-8 and since 1878 has been professor of civil engineering at Lehigh University. In 1880-5 he was also a member of the United States Coast and Geodetic Survey. He is a member of many scientific societies, and has published: 'Theory of Continuous Bridges' (1876); 'Mechanics and Materials' (1885); 'Treatise on Hydraulics' (1889); 'Precise Surveying and Geodesy' (1899); etc.

Merriman, Titus Mooney, American Baptist clergyman: b. Charleston, P. Q., 23 April 1822. He was graduated from Canada Baptist College, Montreal (now McMaster Hall, Toronto), in 1844, served in the United States Christian Commission during the Civil War, and became a naturalized citizen of the United States in 1882. He was a professor at Laselle Seminary, Auburndale, Mass., 1864-95. He published 'William, Prince of Orange' (1874); 'Pilgrims, Puritans and Roger Williams Vindicated' (1892); etc.

Merritt, mēr'it, **Weasley**, American soldier: b. New York 16 June 1836. He was graduated from West Point in 1860 and served with honor through the Civil War and for bravery at Gettysburg was brevetted major. His services at the battles of Yellow Tavern and Winchester gained for him the rank of brigadier-general and major-general. He was assigned chiefly to frontier duty from the close of the Civil War until 1882 when he was made superintendent of West Point and in 1887 placed on duty at Fort Leavenworth, Kan. He commanded the Department of the East 1897-8 and in May 1898 was put in command of the United States troops in the Philippines and conducted the campaign to a successful termination. After the close of the Spanish-American War he was ordered to Paris in order to assist the work of the American peace commissioners. He was retired from active service in June 1900.

Merry, Robert, English poet and eccentric: b. London April 1755; d. Baltimore, Md., 14 Dec. 1798. He was educated at Christ's College, Cambridge, and studied law at Lincoln's Inn; inherited a good deal of money from his father, but quickly squandered it; and about 1784 settled in Florence, where he was made a member of the Della Crusca Academy, and wrote much sentimental verse, some of it answered by Hannah Cowley. He returned to England in 1787; printed some of his verse, which was sarcastically praised by Walpole and was the butt of Gifford's 'Baviad'; and in 1791 married an actress. In the meantime he had become infatuated with the principles of the French Revolution and had lived in Paris. In 1796 they

came to America, where his wife acted with great success and where Merry was regarded as a very superior poet. 'The Abbey of Saint Augustine,' a play by him, was acted in Philadelphia in 1797.

Merry, William Walter, English Anglican clergyman and classical scholar: b. Worcestershire 6 Sept. 1835. He was educated at Oxford and has been rector of Lincoln College there from 1884. In 1861 he became vicar of All Saints Church, Oxford, was select preacher to the University 1878-9, and again in 1889, and public orator in the University in 1880. He is widely known for his editions of the classics published by the Clarendon Press and including the 'Odyssey' (Books I. to XII., 50th thousand; XIII. to XXIV., 15th thousand); and the plays of Aristophanes. He is the author of 'The Greek Dialects' (1875).

Merry England, a popular name for England. The word merry is used, not in the sense of gaiety, but according to its earlier meaning, that is, agreeable, or pleasant; as in the phrase, "merry month of May."

Merry Mount, a district near the present town of Quincy, Mass., which in the early colonial days of New England was occupied by a party of men belonging to the Church of England. They paid little respect to the rigid and austere habits of the Puritans whom they greatly offended by the laxity of their manners. An attack was made upon this settlement by the forces of the Plymouth colony in 1630. John Lothrop Motley, the historian, produced in 1849 a romance entitled 'Merry Mount.'

Merry Wives of Windsor, a comedy by Shakespeare, first produced about 1600 and first printed in its present form in the 'First Folio' of 1623. An imperfect quarto edition appeared in 1602. According to Rowe it was written at the request of Queen Elizabeth, who wanted to see Falstaff in love, but there is no proof of this. An opera by Nicolai with words adapted from Shakespeare by Mosenthal was brought out in Berlin in 1849. It was entitled 'Die lustigen Weiber von Windsor.'

Mersey, mēr'zī, England, a river rising in the range of hills on the southwest confines of Yorkshire, at the point where Cheshire and Derbyshire join the former. It flows in a general southwest direction to Runcorn, where it expands into an estuary two to three miles broad, near the mouth of which, on the north side, is Liverpool, with Birkenhead opposite, and below which it joins the Irish Sea. Since 1886 a railway tunnel under the Mersey has afforded communication between Liverpool and Birkenhead. The entire length of the river, including the estuary, is from 55 to 60 miles. Principal affluent, the Irwell, to which it is navigable. The Bollin and the Weaver are affluents from Cheshire. With the Mersey and Irwell is now closely connected the great Manchester ship-canal (q.v.) which opens into it.

Merson, Luc Oliver, French painter: b. Paris 21 May 1846. He studied at the Ecole des Beaux Arts and was a pupil of G. Chassevent and of Pils. His first picture exhibited in the Salon was 'Leucothea and Anaxandros' (1867). In 1869 he carried off the Grand Prix de Rome, the supreme ambition of art students, by his painting 'The Soldier of Marathon.' He pro-

duced the same year 'Apollo the Destroyer,' now in the Museum of Castres. In 1872 he painted 'The Martyrdom of Saint Edmund of England' (Museum of Troyes). Since then he has devoted his pencil to the portrayal of legendary and mythological scenes and incidents. His chief works in this class are: 'The Vision, a Legend of the 14th Century' (1873); 'A Patriot Sacrifice' (1874); 'Saint Michael' (1875); 'Saint Francis and the Wolf of Agubbio' (1878); 'Saint Isidore' (a triptych) (1879); 'The Judgment of Paris witnessed by Eros' (1884); 'Mankind and Fortune' (1892). He has also frescoed with scenes from the life of Louis IX. the walls of the St. Louis gallery in the Palais de Justice at Paris.

Merthyr-Tydfil, mēr'thēr-tid'vil, or **Tydfil**, Wales, a market and manufacturing town of Glamorganshire, 24 miles by rail northwest of Cardiff, on the Taff, at the northern end of Taff Vale. From an unimportant village in 1780, Merthyr-Tydfil has become a prosperous centre of steel and iron manufactures, owing to its situation near the valuable coal and mineral fields of South Wales, its exports of these various products being considerable. The town has undergone much modern improvement and is noted for its municipal enterprises. Pop. (1901) 69,227.

Mer'ton, Walter de, English bishop: d. 27 Oct. 1277. He was graduated at Oxford University, of which he was appointed chancellor by Henry III. in 1261, and three years later instituted the collegiate, or separate house system of the English University, by establishing the college which is called after his name. Here the secular clergy were to be educated in philosophy, the liberal arts and theology. The system he thus introduced has been the secret of success both to Oxford and Cambridge, and was originated chiefly with the object of raising up secular schools which might check the power of the monasteries and eventually supersede them as centres of education. He was appointed bishop of Rochester in 1274.

Merton College, Oxford, England, was originally founded in 1264 at Malden, Surrey, by Walter de Merton (q.v.), and removed to Oxford in 1274, where its collegiate buildings are among the oldest and most interesting in the city, the chapel especially being noted for its proportions and beauty. The foundation consists of a warden, twenty fellows, eighteen post-masters or scholars, ten exhibitioners, four lecturers, two chaplains, and in 1902, 150 undergraduates. Among its famous alumni are Harvey, Anthony Wood, Sir Thomas Bodley, and Sir Richard Steele.

Meru, mēr'oo, in Hindu mythology, the sacred mountain on whose summit resides Siva, sustaining and uniting earth, heaven, and hell.

Merv, mērv, Russia, an oasis in Central Asia, in the south of Western Turkestan, and about 120 miles north of the frontier of Afghanistan, now traversed by the railroad from the Caspian to Samarkand. It is watered by the Murghab, and produces wheat, cotton, sugar, silk, etc. In the midst of the oasis are the ruins of the ancient town of Merv, founded by Alexander the Great, and subsequently held by Syrians, Arabs, Mongols, and Persians. A new town has grown up on the Murghab, where the

railway crosses the river, with a citadel and 10,000 inhabitants. The oasis generally is the principal seat of the Tekke Turcomans, who from this centre used to make predatory incursions into Persia and Afghanistan. In 1815 the oasis was subjugated by the Khan of Khiva, to whom it remained tributary for about 20 years. Subsequently Persia attempted to make good the claims which it had long made to this district, and in 1860 fitted out an expedition for the purpose, which, however, miscarried completely, as did another expedition in 1876. In 1881 General Skobelev led a Russian expedition against the Tekke Turcomans, captured their stronghold of Geok-Tepe, and received the submission of their principal leader. The district of Merv subsequently came under the power of Russia. Merv is of great strategical importance, and the interest now attached to it is connected with the recent advances by Russia in the direction of India. Pop. 200,000.

Merwin, Henry Childs, American lawyer: b. Pittsfield, Mass., 5 Aug. 1853. He was graduated from Harvard in 1874 and was for some years lecturer in the law school of Boston University. Beside editing several legal works he is the author of 'Patentability of Inventions' (1884); 'Road, Track and Stable' (1893); 'Life of Aaron Burr' (1899); 'Life of Thomas Jefferson' (1901).

Merwin, Samuel, American author: b. Evanston, Ill., 6 Oct. 1874. He was educated at Northwestern University (Evanston, Ill.), and published with H. K. Webster (q.v.) 'The Short Line War' (1899), and 'Calumet K.' (1901), independently 'The Road to Frontenac' (1901) and 'The Upper Hand' (1903).

Meryc'odus, or **Cosoryx**, a small antlered antelope fossil in the Miocene formations of the western United States. It was about the size of a dorcas gazelle, but with shorter limbs and neck and belonged to the family *Antilocapridæ*, now represented only by the pronghorn (q.v.); but it bore relatively tall three-tined antlers, which were deciduous and precisely like those of deer. Minute lateral toe-rudiments hung high above all the hoofs, but these were relatively smaller than in deer; in the modern pronghorn no trace of these remains. It was probably a collateral ancestor of the antelopes. *Blastomeryx* is a closely related genus somewhat more primitive. A very complete skeleton, collected by W. D. Matthew, is exhibited in the American Museum of Natural History at New York.

Méryon, Charles, shārl mā-rē-ôn, French etcher: b. Paris 23 Nov. 1821; d. Charenton 14 Feb. 1868. He entered the navy, after studying at Brest, but failing health forced his resignation, and he settled in Paris, studying etching there. His chief works were picturesque spots in old Paris, many since destroyed. A series of 23 plates by him appeared 1850-4. His last years were spent in an insane asylum at Charenton. Consult Wedmore, 'Méryon and Méryon's Paris' (1879); Burty, 'L'Œuvre de Charles Méryon,' translated by Huish (1879); Bouvenne, 'Notes et Souvenirs sur Charles Méryon' (1883).

Me'sa, a table-land, or plain; a term common in southern California and Mexico.

Mescal', a fiery liquor produced in Mexico from several species of *Agave* (q.v.). The most

famous liquor however is made from the "hearts" of the species recently described as *Agave tequilana*. The city of Tequila, in the state of Jalisco, is the centre of this particular industry. The Tequila *Agave* resembles in the appearance of its stiff lance-like leaves the sisal hemp plant, though it sends out its leaves from a great bulb-like cellular mass which forms the heart of the plant. This heart, when denuded from its leaves and detached from the root, is cleft in two, and a dozen of these pieces make a fair load for a mule, for they must be transported from the fields where grown to the city, sometimes a journey of several miles. These hearts are roasted in pits, within the distillery enclosures, dug four or five feet deep and considerably wider. A hot fire is built of mesquite wood, and large stones distributed through the fuel. The "heads" are then heaped over the burning mass until a huge mound is formed, which is covered first with grass and then with earth, and the mass left several days to cook. When the mound is opened the raw product is found to have changed to a dull brown in color, and the juices to have been converted into sugar. While hot and steaming the mass is taken to another pit, stone-paved, on the bottom of which revolves a heavy stone crusher, driven by a sweep and mule power. Here it is ground into pulp, and the semi-liquid mass carried in deep trays on the heads of Indians to the vats where it remains to ferment. Then it goes to the rude stills, and is run off as mescal.

The commercial mescal is a colorless liquor sometimes with a slight amber tint, though much of it is like alcohol. Some of the higher grades are given fancy names which serve as trademarks. It is far too strong a liquor to be drunk by Americans with impunity, though its fiery quality seems to suit the Mexican taste for hot things. Zotol is another liquor, made in the same way from the bulb-like heart of a species of *Dasylium*, which is said to be as strong as 95 per cent alcohol. These liquors should not be confounded with aguardiente, which is made from sugarcane. The Mexican name means burning water.

CHARLES RICHARDS DODGE.

Mesca'la. See MEXCALA.

Mesdag, mēs'däg, Hendrik Willem, Dutch marine painter: b. Groningen 23 Feb. 1831. He was a banker, following in his father's footsteps, until his 36th year, when he devoted himself to art, studied under Alma Tadema, who was a relative, and under Roelofs, and lived at The Hague, with a studio at Scheveningen. He takes a foremost rank among modern painters of the sea, and conveys the idea of water-masses and motions very felicitously. The report circulated in American newspapers of his death 4 Aug. 1902 was false. Mesdag's pictures include 'Fishing Boats at Scheveningen,' 'Strand of Scheveningen,' 'Morning on the Scheldt,' 'In Peril,' and many other views of the North Sea. Consult Zilken, 'H. W. Mesdag' (English version by Bell, 1896).

Meshed, mēsh'ed, or **Messhed**, mēsh'hēd, Persia, capital of the province of Khorasan, in an extensive valley 500 miles northeast of Ispahan. It is surrounded by walls, and has many ruinous houses, but its principal street is spacious and handsome, having a water-course, the banks of which are shaded by trees, passing

MESMER — MESOPOTAMIA

through it, while at its extremity are seen the splendid cupola and gilded minarets of the mosque containing the shrine of Iman Riza, the son of Ali, the founder of the Shiites. This tomb has a gorgeous interior, a vast hall, like the central nave of a cathedral, rising loftily into a central dome ornamented with the richest colors and a profusion of gilding. This shrine attracts a vast number of pilgrims. Here also is the mosque of Gohur Shah, considered one of the most beautiful and splendid in Persia. The chief manufactures are velvets, sword-blades, and some silk and cotton goods. A considerable number of the inhabitants are employed in cutting the turquoises obtained in the vicinity. The situation of Meshed, on several great caravan routes makes it an important entrepôt for the produce of surrounding countries. Pop. est. 61,500.

Mesmer, Friedrich (or Franz) Anton, fréd'rih an'ton mēs'mēr, German physician: b. Itzmang, near Constance, Baden, 23 May 1733; d. Meersburg, Baden, 5 March 1815. He was educated in medicine by Van Swieten and De Haen of the University of Vienna, made some study of astrology, came to believe in the influence of the stars, and attributed this supposed influence to magnetism. Having at first believed in the cure of diseased bodies by the use of magnets, he came wholly to discard the magnets and declared that an occult force, which he called animal magnetism, pervading the universe, resided in himself and afforded him an influence over others. In 1778 he went to Paris and set the town astir. He had undoubtedly an honest belief in the efficacy of his discoveries and the reality of the phenomena displayed; but he took advantage of popular interest to enshroud his methods with mystery. Finally the government appointed a committee of noted physicians and members of the Academy of Sciences, including Benjamin Franklin, to investigate the matter; and the committee in a report admitting many facts but attributing them to physiological causes and not to any such supposed agency as animal magnetism, so discredited Mesmer that he went to London, and later to Germany. The name mesmerism was formerly applied to the entire class of phenomena now known as Hypnotism (q.v.). Among his writings are 'Mémoires sur la Découverte du Magnétisme Animal' (1779); 'Histoire Abrégée du Magnétisme Animal' (1783); and the 'Mémoire de F. A. Mesmer sur ses Découvertes' (1799). See MESMERISM; HYPNOTISM.

Mes'merism. See ANIMAL MAGNETISM.

Mesne (mēn) Process, in law, an intermediate process which issues pending the suit upon some collateral interlocutory matter. Sometimes it is put in contradistinction to primary and final process, or process of execution, and then it signifies all such processes as intervene between the beginning and end of a suit.

Mes'oderm. See ANATOMY, COMPARATIVE; EMBRYOLOGY.

Mesohip'pus. See HORSE, EVOLUTION OF.

Mes'onyx, a primitive carnivorous animal of the group called *Creodonta* (q.v.), which must have resembled in external aspects, when alive, the modern Tasmanian wolf of Australia. Its remains are found fossil in the fresh-water formations of Eocene Age along the eastern base of

the Rocky Mountains, and a complete skeleton is mounted in the museum of Princeton University. This specimen (*Mesonyx obtusidens*) indicates an animal as large as a St. Bernard dog, with its hindquarters drooped somewhat, like those of a hyena. Consult Woodward, 'Vertebrate Palæontology' (1898).

Mes'ophyte (Gr. "mid-grower"), in botany and forestry, a term used of plants which grow naturally in soil of moderate moisture. Thus the term is contrasted on the one hand with xerophyte, "dry-grower," and hydrophyte, "wet-grower," these latter terms being applied to plants requiring very little or very much moisture. Since soil of moderate moisture varies from moist to dry, whereas both the dryer and wetter soils are comparatively invariable in this respect, it naturally follows that Mesophytic plants show more adaptability to conditions of moisture than either hydrophytes or xerophytes. For the same reason, no doubt, the mesophytic flora, being comparatively stronger, is denser and marked by much wider variations of species, than the scanty and monotonous growths of poorer, because wetter or dryer, soils.

Mesopotamia, mēs'ō-pō-tā'mī-a (Gr. *mesos*, middle, and *potamos*, river, signifying the land between the rivers, and called by the Arabians *Al Jezireh*, or the island), Turkey. The Greeks called by this name the extensive region enclosed by the Tigris and Euphrates, and bounded on the north by the Taurus and Masius; but the name is generally applied to the northern part of this region, which is mountainous, and rich in grain, wine, and pasturage; the southern part being flat, dry, and unfruitful. Its Old Testament name is *Aram Naharaim*, or Syria of the Two Waters; and also *Padan Aram*, or Syria of the Plain. It is mentioned in the Old Testament in connection with Isaac and Jacob (Gen. 24 and 27). The Greek title was probably not in use till after Alexander the Great invaded the East. This country has always been inhabited by husbandmen, who live a settled life, and by shepherds, who wander from place to place. The Mesopotamians sprang from the Chaldeans, the primitive inhabitants; from the Cushites, who in the reign of Nimrod built the cities of Edessa and Nisibis; and from the descendants of Shem, of the tribe of Thara. It was originally a part of Nimrod's dominion. After an interval of more than 700 years (2000 B.C.) Cushan Rishathaim reigned in Mesopotamia, who extended his dominion over the Euphrates. The Israelites, who then possessed Palestine, were compelled to pay him tribute for the space of eight years. In the golden age of the Assyrian power (700 B.C.) Mesopotamia was entirely subjected to that empire, and suffered the fate of its subsequent conquerors. Trajan subjected it to the dominion of Rome 106 A.D., but the Persians did not suffer the Romans to remain long in undisturbed possession of it. It was a constant cause of war between the Persian and Roman empires, and at last Jovian surrendered it to the Persians, 363 A.D. When the Arabs in 651 established a new empire upon the ruins of the kingdom of the Sassanids, Mesopotamia was also obliged to submit to the storm. In the year 1040 it fell into the hands of the Seljuks. From that time it had many rulers in rapid succession. Genghis Khan made himself master of it in 1218, but in the year 1360 it fell

MESOZOIC ERA — MESSENIA

into the hands of Tur Ali Bey. Forty years afterward Mesopotamia was conquered by Timur, and in 1514 Ismael Sophi incorporated it with the Persian empire. The Persians were, however, in 1554 compelled to cede more than half of it to the Turks; and though they again in 1613 recovered the lost portion, they were unable to withstand the attacks of Amurath IV., who united this in 1637, with many other provinces, to his empire. The people are mostly Arabs, a few Kurds in the north, and some Syrian Christians and Armenians. The people are nearly independent of the Turkish government, although the country is a part of Turkey.

Mesozoic Era, in geology, the mid-period of life in geologic time, also called the Secondary Period. Palæozoic precedes and Cenozoic follows this era, these two terms referring respectively to "older" and "newer," or "earlier" and "later," forms of prehistoric life. The mid-period is marked by the great development of reptilian life, and is sometimes styled the Age of Reptiles. The subdivisions of the Mesozoic are Triassic, Jurassic, and Cretaceous (qq.v.).

Mesquita, mäs-kē'tä, **Salvador de**, Brazilian poet: b. Rio de Janeiro 1646; d. Rome, in the early 18th century. He went to Rome, where he entered holy orders, and was well known for his Latin scholarship. His 'Sacrificium Jephthæ' (1680), a sacred drama, established his poetic fame among contemporaries. His tragedies from profane history, 'Demetrius,' 'Perseus,' and 'Prasias Bithyni,' all appearing at Rome between 1690 and 1700, also had once high rank.

Mesquite (mēs kēt') **Tree**, **Algaroba**, **Honey Pod**, **Honey Locust**, or **Cashaw**, a shrub or tree (*Prosopis juliflora*) of the natural order *Leguminosæ*. It is a native of the arid southwestern United States, extends southward to Argentine Republic and Chile, and is found in the Hawaiian Islands, where it was introduced by the missionaries. When well supplied with water it often becomes a widespread tree of sixty feet in height and three feet in diameter, but ordinarily it is a straggling shrub only a few feet tall. It is usually spiny, bears pinnate leaves, small flowers in cylindrical spikes, and numerous straight or sickle-shaped pods about six inches long. The wood is used for fuel, and when large enough, for building purposes, posts, etc., for which, being very durable, it is well adapted. The leaves and tender shoots are valued stock food, resembling alfalfa hay in composition. The pods, which are very saccharine, are also greedily eaten. They should be dried and ground to obtain the greatest value, since the highly nitrogenous seeds are likely to resist the digestive process. A clear or light yellow gum, which oozes from the trunk and branches in tear-like drops, is used in confectionery and in laundries; and a black gum, probably the same mixed with some coloring matter, is obtained from wounds. Being rich in tannin (sometimes containing 20 per cent) it is used with iron compounds for dyeing. In California, the tree is often planted for hedges. A closely related species (*P. pubescens*) known as tornillo, curly mesquite, and screw bean, is a smaller growing tree or shrub ranging from Texas and Mexico to California. It is characterized by its twisted pods only a couple of inches long. Both species are important sources of honey; the flowers being plentiful for about ten weeks.

Mess, in the army and navy, and particularly the latter, a company of officers, or crew of a ship, who eat, drink, and associate together; in military language, a sort of military ordinary, established and regulated by the rules of the service, for all the officers in a regiment, and supported by their joint subscriptions, supplemented by a small government allowance. Similar institutions are extended to the non-commissioned officers of a regiment.

Messala (mē-sā'la) **Corvinus**, **Marcus Valerius**, Roman soldier, orator, and writer: b. about 65 a.c.; d. about 2 b.c. He received a part of his education in Athens, returned to Rome before the second triumvirate, and joined the Senatorial party. He fought with Brutus and Cassius at Philippi, 42 a.c., and afterward attached himself successively to Antony and Octavius, served at the battle of Actium, 31 a.c., and the same year was chosen consul. He subdued Aquitania, of which he was made proconsul, and was honored with a triumph. For a time he was a prefect of Rome, and held the office of augur. Messala was the friend of Horace and other distinguished men of the age, a zealous patron of literature and art, notably of the poet Tibullus, and one of the most eminent of Roman orators.

Messalina, mēs-a-lī'na, **Valeria**, Roman empress. She married Claudius (later emperor) in 38 a.d.; bore him a daughter, Octavia, and a son, Britannicus; proved herself vicious, licentious and vulgar by her many open amours; and in her husband's absence formally married Gaius Silius, whom she attempted to make emperor. Claudius refused or delayed to punish her, and Narcissus, the emperor's favorite, had her put to death (whether with Claudius' knowledge or not is not known) in 48 a.d. Her reputation was whitewashed in Stahr's 'Agrippina, die Mutter Neros' (1880).

Messene, mē-sē'nē, the capital of Messenia in Peloponnesus, founded by Epaminondas (369 n.c.) after his victory of Leuctra over the Lacedæmonians, and situated at the foot of the hill of Ithome, the fortress of which formed the acropolis of the new capital. The latter was surrounded by massive stone walls, flanked with towers, of which there are still considerable remains at the modern village of Mavromati. The Greek Archaeological Society, in 1895, excavated a colonnade and other parts of the ancient agora. Messene with its acropolis was, next to Corinth, the strongest city of Peloponnesus. It was supplied with water from a fountain called Clepsydra, the spring of which still exists.

Messenia, mē-sē'nī-a, Greece, a nomarchy in the western part of Morea (Peloponnesus), bounded on the north by Elis and Achaia and Arcadia, on the east by Arcadia and Laconia, on the south and west by the Ionian Sea. The greater part of the surface is a fertile plain, but there are mountainous lands in the east and northeast. Kalamata, the capital, is in the south-east on the Gulf of Koron (Messenian Gulf). When Messenia was a state of ancient Greece its chief cities were Methone and Pylos (Navarino). Later Messene (Mavromati) was the capital, and the strong mountain fortress was Ithome. A ridge of Mount Taygetus separated Messenia from Sparta. Messenia is celebrated for the long struggle of the inhabitants with the Lacedæmonians in defense of their liberty. In the

MESSED — MESSIAH

first Messenian war (743-723 B.C.) the Lacedæmonians, with the Athenians, invaded Messenia. For twenty years the Messenians defended themselves valiantly under their king Aristodemus, who in consequence of an answer of the Delphic oracle which promised them the victory on condition of the sacrifice of a virgin of the royal family, offered his own daughter as the victim. Her lover, to save her life, declared her to be pregnant by himself; and Aristodemus, to prove her innocence, stabbed her with his own hand, and caused her to be opened and sacrificed. The Messenians, though for some time successful, were finally obliged to submit by the loss of Ithome. About forty years after, they again rose, and thus commenced the second Messenian war (685 B.C.), which ended in their entire subjugation. A part of the Messenians emigrated to Sicily, and there founded Messana (see *MESSINA*) on the site of the ancient Zancle (668 B.C.). Those who remained were reduced to the state of helots. After 200 years of servitude they again took up arms. This third Messenian war lasted ten years (465-455 B.C.), and resulted in the expulsion of the Messenians from the Peloponnese. Epaminondas restored them, gathering together the exiles from the various lands in which they were scattered. Within the space of 85 days, they completed and fortified Messene (369 B.C.), and maintained their independence till the country was conquered by the Romans (146 B.C.). The Messenians remained true to their customs, manners, and language through all changes of fortune.

Messed. See *MESHED*.

Messiah, The (Greek, *Messias*, a transcription of the Aramaic *Mesluha*, from the Hebrew *Mashiach*, the anointed one, the Christ), the prince or king, who in the historic expectation of the Jews is to restore Israel and bring in an era of political power and godliness. The term Messiah, anointed, is applied in Hebrew literature to all kings, and sometimes to priests (Lev. vi. 22; Isa. xiv. 1); but in some of the Psalms the term denotes something more than a mere earthly king. The prophets over and over again state their anticipation of Jehovah's coming at some future day, "the Day of the Lord" to establish his kingdom upon earth. He will make Zion his dwelling place and rule all nations as their king (Zech. xiv. 16). But his instrument in perfecting the kingdom of God is to be a king in the house of David: "I the Lord will be their God and my servant David a prince among them" (Ezek. xxxiv. 24). This prince of the house of David is the anointed one, the Messiah.

Prophecies of the Old Testament.—In some places in the Old Testament (q.v.), a great king of the line of David, who must be the Messiah, is foretold. He is the "king" and the "king's son" of some Psalms (Ps. lxi. 1). The king who is also a "priest" (Ps. cx. 4) is the "Immanuel" and "Prince of Peace" of Isaiah; the "messenger or angel of the covenant" of Malachi iii. 1.

Apocalyptic Literature.—The age of the Old Covenant like that of the New had its books of Revelation, in which the coming of the Messiah is plainly intimated. In the book of Enoch (100 B.C.) which breathes the most ardent spirit of Messianic hope, he is the "White Steer" whose pre-eminence is to be acknowledged by

the beasts of the earth (the Hebrew nation), and the fowls of the air (the pagan world). In the 'Psalter of Solomon,' composed soon after the destruction of Jerusalem by Pompey, he is the "King, the anointed of the Lord." But the apocalyptic literature of the Jews made a profound impression even upon the heathen world. In the Sibylline books (an Alexandrian production of 140 B.C. (much of whose contents must have been taken from the prophecy of Daniel)) the coming glory of Israel and the triumph of Messiah over the heathen world is announced in Greek hexameters. This is the more remarkable because Greek and Roman alike looked back to their Golden Age as part of the irreparable past, and saw nothing in the future, though Virgil in his Eclogue Pollio mimicked the Sibyl in foretelling of a future which he describes in terms full of Messianic imagery.

Messianic Hopes in the Apocrypha.—The apocryphal books of the Old Testament make no mention of a personal Messiah, though they contain passages faintly tinged with joyful anticipations of the future, founded on the promises made to the patriarchs and to David (Ecclus. xlv. 21; xlvii. 2) and the coming of Elias (Ecclus. xlviii. 10). These anticipations are most plainly reflected in the prayers and aspirations of Ecclus. xxxvi. In the Book of Wisdom the future predominance of the Jews, the righteous people, is plainly predicted, "They shall judge the nations, and have dominion over the people, and their Lord shall reign forever," but no mention of Messiah, the Son of David, is made. So in the book of Baruch the restoration of Israel to "joy and gladness forever" (iv. 23), the dawn of happier days to Jerusalem (36) are distinctly promised, but no personal deliverer is ever alluded to. A reference is made in Tobit to the conversion of the Gentiles (iv. 21) but not to the coming of a political ruler and anointed Saviour. In the Maccabæan period the minds of the Jews seem to have been confused about the coming of the Messiah, whose character some of them may have found realized in John Hyrcanus, prophet and priest as well as king. Philo's writings are absolutely destitute of anything like an intimation that he looked for the coming of the Messiah.

Messianic Hopes in History.—Nevertheless the great national anticipation of the Jewish people was not dead. Their expectation of the imminent advent of the Messiah raised them in revolt against the Roman yoke and brought on the war that terminated with the destruction of Jerusalem. Even the ruin of the temple did not quench their hopes. In the reign of Hadrian these hopes revived under Bar-Cocheba (130 A.D.), who was greeted as Messiah by Rabbi Akiba, and by his pretensions was able to lead his ever sanguine countrymen to that final revolt which proved their death struggle. There were, however, some traces of a division in Jewish opinion on this point as early as the time of Constantine, when Hillel the Second declared that Messiah had already appeared in the days of Hezekiah. To which Rabbi Joseph replied, "God forgive Hillel for that." Hillel the Second was the precursor of those Reformed Jews who in our own time have rejected a belief in a future Messiah and the restoration of Jerusalem. There can be no doubt, however, that this belief is embedded in rabbinical theology, and that the coming of a political restorer of Israel is implied

MESSINA

as a part of current Hebrew faith in the prayers still used by the Hebrews. In the Jewish creed, as compiled by Maimonides in the 11th century, are found the words, "I believe that the Messiah is yet to come." One of the most remarkable chapters in the history of the Jewish race is that which details the temporary success of those visionaries or impostors who announced from time to time that the Messiah had come in their person. Such was Moses Cretensis who in the reign of Theodosius the Younger, 434 A.D., induced the Jews of Crete to look upon him as "the prophet like unto Moses" of Deuteronomy, the Messiah, and promised to prove it by parting the waters of the Mediterranean. Men, women and children flung themselves at his bidding from a height into the sea and were drowned. Such was Dunaan in the reign of Justin, 520 A.D., who called himself the Christ and persecuted the Christians of Arabia Felix, and was followed by many fanatics whom Elesban, the Ethiopian general, crushed in battle and slew their leader. A more remarkable man was the Syrian Jew Srenus who deluded the Messianic hopes of the Jews in Spain, drawing great numbers after him for a while, in the time of Leo the Isaurian, 721 A.D. In the 12th century there were false Messiahs in France, Germany, and Spain. David Alruï, the false Messiah of Fez (1167), is familiar through Lord Beaconsfield's 'Alroy.' In the same year a fanatic Arabian attracted thousands to follow him by proclaiming himself the promised deliverer. "Cut off my head," he said, when brought before the king, "and I will prove my claims by returning to life." He was taken at his word, and his claims being of course discredited, his adherents were scattered. Three false Christs arose in Persia between the years 1138 and 1199. The persecution of the Jews in Spain and Portugal and the decree enjoining their compulsory baptism had crushed that people in the dust during the 14th and 15th centuries. Their Messianic hopes were almost quenched; they declared that oppression was forever to be their lot; they felt that theirs was worse than a Babylonian exile. Then the learned Rabbi Abrabanel wrote a series of books announcing the coming of the Messiah, and fixing the date as 1503. This was a signal for a series of impostors to arise. Among others a German rabbi, Arches Lämmlin, in 1502 declared himself to be Elias the Forerunner. His proclamation went through all Europe and won thousands of adherents, even among Christians in Germany, Italy, France, and Spain. His sudden death brought grief and confusion on his followers. But the greatest of all these impostors was Sabbathai Zebi (q.v.), a native of Aleppo, who formed a sect which still has great influence in the East. A Polish Jew named Frank (see FRANK, JACOB) arose about 1850 and professed to carry on the work of Sabbathai Zebi, though he made no Messianic claims, and in a posthumous work of his counseled the Jews to embrace Christianity. While the conservative Jews of the present day still cling to that hope of a Messiah which cheered their nation through the Oppression, the Exile, the Roman Conquest, the Dispersion, and the long and bitter era of mediæval persecution, the Reformed Jews who originated in the 19th century have rejected the doctrine of a Messiah and look to the natural progress of humanity for the advance-

ment and deliverance of their race. Consult Birch, 'De Messia' (1789); Stehelin, 'The Traditions of the Jews' (1751-2); De Rossi, 'Della Vana Aspettazione degli Ebrei del Loro Re Messia' (1773); Delitzsch, 'Messianische Weissagungen' (1890); Drummond, 'The Jewish Messiah' (1877); Goodspeed, 'Israel's Messianic Hope' (1900); Briggs, 'Messianic Prophecy' (1902).

GEORGE E. RINES,

Editorial Staff, 'Encyclopedia Americana.'

Messina, mēs-sē'nā, Sicily, town and seaport, capital of the province and on the strait of the same name. Messina is walled, flanked by bastions, and defended by a citadel on the south, and several forts both on the east and west. The harbor is one of the best in the Mediterranean, and so much resembles a sickle that the town took its original Greek name from that implement, called *zancle*. Fronting the harbor is a broad quay called the Marina, adorned with statues and fountains and forming a favorite promenade. The streets of the old town are narrow and dirty, but the modern town, built since the earthquake of 1783, is generally composed of houses of two stories, and has spacious streets, well paved with blocks of lava. Among the public edifices are included nearly fifty churches, many of them of great beauty, and adorned with fine sculptures and paintings. The cathedral is a Gothic structure, with a somewhat heavy exterior, but supported within by vast pillars of granite, supposed to have belonged to a temple of Neptune. The viceroy's palace, the archiepiscopal palace, the senate house, grand seminary, college, large and well-endowed hospital, numerous convents, two theatres, lazaretto, and arsenals, are some of the other buildings worthy of notice. The manufactures consist chiefly of silk goods. The trade, both transit and general, is extensive. The principal exports are silks, olive oil, linseed and other seeds, oranges, lemons, and other fruits; corn, wine, and spirits; salted fish, licorice, lemon-juice, shumac, essences, rags, brimstone, etc. The tunny and other fisheries are carried on to a considerable extent. In 1901 the exports were \$10,852,164, and the imports were \$4,122,600. Messina has a government university, founded in 1549, which had 692 students in 1901. It has departments of law, medicine, science, and classics. It has also a naval seminary, and a number of elementary schools.

Messina, under the name of Zancle, is said to have been founded 1004 B.C. The Messenians obtained possession 668 B.C. Pop. (1901) 149,823.

Messina, Strait of (Italian, *Faro di Messina*; Latin, *Fretum Siculum*), a channel which separates Sicily from Italy, and connects the Tyrrhenian and the Ionian Sea. It has a length of about 20 miles, and gradually widening toward the south, attains, on the parallel of 38°, a width of 11 miles; but in the north, where it is narrowest, does not exceed two miles. The depth is great, in some parts over 4,000 feet, and a strong current continually running with the tide makes the navigation somewhat difficult, but by no means so formidable as was fabled by the ancients, to whom the rock of Scylla, and the whirlpool of Charybdis, on the opposite side, but at some distance to the south, seemed so dangerous that it was generally believed to be

MESSMATES—METACHROSIS

almost impossible to avoid the one without being dashed upon the other.

Mess'mates, Animal. See COMMENSALISM.

Messmer, mēs'mēr, Sebastian Gebhard, American Roman Catholic bishop: b. Goldach, Switzerland, 29 Aug. 1847. He was educated in Switzerland and at the University of Innsbruck, Austria, and ordained to the priesthood in 1871. He then removed to the United States and accepted the chair of theology at Seton Hall College, South Orange, N. J. In 1890 he was appointed professor of canon law at the Catholic University in Washington, D. C., in 1892 was consecrated bishop of Green Bay, and in 1903 became archbishop of Milwaukee. He has written: 'Praxis Synodalis' (1883); 'Spirago's Method' (1901); etc.

Mestizos, mēs-tē'zōs, or Metis (Spanish, mixed). In countries where Spanish Europeans have settled and intermingled with the natives, the descendants are called *Mestizos*. In Mexico the European Spaniards were called *Chapetones* or *Gachupines*. The pure descendants of Europeans are called *Creoles* (see CREOLES) in similar countries. The *Mestizo* is described as having a transparent skin, a thin beard, small hands and feet, and a certain obliquity of the eyes. If a *Mestizo* marry with a white, the fruit of the union differs but slightly from a European.

Meta, mā'tā, a river of South America, which has its rise on the eastern slope of the Andes Mountains near Bogota in Colombia. It is formed by the junction of two small mountain streams, which unite about 40 miles southeast of Bogota, then flows east-northeast into the Orinoco; a course of about 500 miles. A number of small rivers flow into the Meta from the north; the junction of the Meta and the Orinoco is on the boundary between Colombia and Venezuela.

Metabetchouan, mēt'a-bēt-choo-ān', Canada, a river of Quebec flowing into Lake St. John from the south. It is a broad stream, 90 miles long, and navigable for a considerable distance. The celebrated Falls of Metabetchouan over 230 feet high are near its mouth.

Metabolism (Greek *μεταβολή*, a change), the whole series of physico-chemical processes connected with the manufacture of protoplasm and with nutrition and growth. It has been divided into constructive metabolism (anabolism), and destructive metabolism (katabolism). The former comprises the processes by which the substances taken as food are converted into protoplasm, while katabolism is the means by which the protoplasm breaks down into simpler products, such as the excretory or waste matters. Metabolism thus comprises the elementary vital phenomena of plant and animal life. These are the occurrences associated with changes of substance, of form, and of energy. All organisms undergo continual changes of their substance or protoplasm, etc., alterations of their form, and transformations of their energy. Thus as regards food, since all living matter is continually undergoing decomposition, it must take in substances that contain all the chemical elements of which it is constructed, but the food differs with every form of cell. Plants live on inorganic substances and animals on organic, that is, material already prepared; no animal being able to live on simple inorganic compounds. Among

animals there is a remarkable adaptation to a single kind of food. For example the larva of the fur-moth lives exclusively upon the hairs of fur, which consist of pure keratin; this substance, which is closely allied to proteid, is therefore capable of furnishing all the elements necessary for the formation of the protoplasm of this caterpillar. Dogs when worked hard have been found to be able to live on pure proteid food. On the other hand, according to Verworn, it is impossible for an animal to live solely on carbohydrates or fats, or even on the two together, since there is no nitrogen in these substances.

Vital motion or metabolism is a complex sharply characterizing living organisms, and the taking in of food and the excretion of waste products give to the organism the material with which to regenerate itself and to grow. Metabolism is increased by heat, the consumption of oxygen being increased in cold-blooded animals, but warm-blooded animals undergo a decrease under heat. Thus man in winter has a much more active metabolism than in summer, since he consumes more food at low temperatures.

It is claimed by Verworn that every species of animal possesses a specific metabolism, and that under certain conditions products of metabolism may stimulate an animal to increased growth, while under other circumstances they may retard growth. Thus the usually deadly uric acid in moderate amounts exerts a favorable influence on the size of larvæ of sea-urchins. Illustrations are afforded by experiments in raising snails and water-fleas (*Daphnia*) in small volumes of water; besides the diminished volume, the water fouled by their excretions may not only dwarf but gradually kill them, or produce changes of form.

Consult Verworn, 'General Physiology' (New York, 1899); Vernon, 'Variation in Animals and Plants' (New York, 1903).

Metacen'tre, in mathematics, the point of intersection of the vertical line passing through the centre of gravity of a floating body in *equilibrium*, and a vertical line through the centre of gravity of the fluid displaced, if the body be turned through a small angle, so that the axis takes a position inclined to the vertical. If the metacentre is above the centre of gravity, the position of the body is stable; if below it, it is unstable.

Metachro'sis, the change of color brought about in the surface of certain animals, either voluntarily or involuntarily, to make them conform to their surroundings. It is exhibited in many of the lower animals as a protective device, especially in cuttlefishes, caterpillars, various amphibians, especially frogs, and certain lizards, notably the chameleons. The dark pigment to which the brown or gray colors of metachroic caterpillars are due is deposited in the cells of the outer skin, while the green coloring matter is found in the underlying fat; and, as Carpenter says, experiments have shown that the presence or absence of both kinds of pigment is determined by the surrounding objects through the quality of the light reflected from them, the suppression of the superficial dark pigment allowing the deeper green to show through the skin, and thus give its hue to the caterpillar. It has been shown that the formation of the dark pigment is hindered by the action of certain yellow rays which are absorbed

METACINNABARITE — METAL

by dark objects, but reflected from green leaves and shoots.

The process of change in squids, frogs, etc., through nervous and muscular control of pigment sacs, called chromatophores, is somewhat different, and is explained in the article CHAMELEON. The power possessed by these animals of adapting their color to their surroundings must be of great value in ensuring preservation from enemies. Consult Beddard, 'Animal Coloration' (1892).

Metacin'abarite, a native sulphid of mercury, occurring amorphously, when it is black or dark gray, or in tetrahedral crystals. To its black color it owes its early popular name, Æthiops mineral. Metacinnabarite is found in California.

Metagen'esis, or Heterogony, a term proposed by Owen for a form of parthenogenesis. It is that form of alternation of generations (q.v.) of which one generation reproduces only asexually, by division or budding, the other exclusively by laying eggs. A good example is the mode of reproduction of hydromedusæ in which the hydra-like stage gives rise to medusæ, the latter laying eggs. Another case is that of the aphides, whose asexual individuals produce multitudes of young by budding, the next generation consisting of males and females, the latter laying fertilized eggs. An individual of the first generation is called the nurse; one of the second generation the sexual animal.

Another term for this phase of reproduction is heterogony (or heterogenesis), which Hertwig defines as "regressive alternation of generations." He mentions another form of heterogony where two generations with different forms and structure alternate. For example, a hermaphroditic thread-worm (*Ascaus nigrovenosa*) lives in the lungs of frogs; it produces a form (*Rhabdonema nigrovenosum*) which lives in mud, and which lays eggs giving rise to the ascaris of the frog.

Metal. The elements are usually divided by chemists into two classes, metals and non-metals. Formerly the classification was based on physical properties, and the metals were then elements which were opaque, had a metallic lustre and were good conductors of heat; now the division is made on chemical properties, and a metal is defined as an element which has the power to replace hydrogen of acids and form salts, in other words it is a base-forming element. However, no sharp line can be drawn between the metals and non-metals, since some of the elements belong to both classes. Some metals have a high specific gravity, but lithium, sodium, potassium, etc., float on water, and in general the metals of highest specific gravity are least active chemically. Some 45 elements are usually classified as metals.

A mass of any metal is believed to be composed of atoms arranged in molecules, and any change in the arrangement of the molecule means a change in physical characteristics. Thus crystalline structure may be obliterated by rolling or hammering a metal and by the same means the specific gravity may be increased, since the molecules are forced nearer together.

All metals with exception of bismuth are lighter when molten than when cold. Bismuth, like water, reaches its greatest density just before solidifying. The relative specific

gravities of some common metals in the solid and in the liquid state are shown by the following table, compiled by Sir Roberts-Austen:

METAL	Sp. g. of solid	Sp. g. of liquid
Iron (pig)	6.95	6.880
Zinc	7.20	6.480
Tin	7.50	7.025
Copper	8.80	8.217
Bismuth	9.82	10.55
Silver	10.57	9.510
Lead	11.40	10.370

The fracture of metals is not a property, but a feature which gives much information about the manner in which it cooled, the presence of impurities, etc., and is of great practical value. Thus foundry iron is graded and sold by its fracture, and in smelting copper and refining lead the decisive points in the processes are determined by the fracture of test samples. Slow cooling, as with chemical solutions, helps the formation of large crystals, giving a coarse fracture, while a sudden cooling may prevent the formation of crystals and thus give a fine fracture. Crystalline structure, which determines fracture, may be affected by repeated shocks or vibrations. In this way the wrought-iron chains on railroad cars to prevent accident in case of a coupler breaking may by the jolting of ordinary service become so crystalline as to break when needed. Very low temperatures, as shown by the experiments of Dewar, also affect in a marked manner the crystalline structure of some metals. Any metal is fusible, though arsenic sublimates at 180° C.; it may be fused under the pressure of its own vapor. When heated, metals give a red and finally a clear white color. The temperatures corresponding to these colors are approximately: incipient red, 525° C.; dark red, 700°; incipient cherry red, 800°; clear cherry red, 1000°; white, 1300°; dazzling white, 1500°.

Certain physical constants of some of the metals are shown in the following table, the figures being from Roberts-Austen's 'Introduction to the Study of Metallurgy.'

METAL	Symbol	Atomic Weight	Specific Gravity	Melting Point °C
Aluminum	Al	27.00	2.56	649°
Antimony	Sb	120.00	6.71	632°
Arsenic	As	74.90	5.67
Bismuth	Bi	207.50	9.80	268°
Cadmium	Cd	111.70	8.60	321°
Chromium	Cr	52.40	6.80	higher than platinum
Cobalt	Co	58.60	8.50	1500°
Copper	Cu	63.20	8.82	1083°
Gold	Au	197.20	19.32	1063°
Iron	Fe	55.90	7.86	1600°
Lead	Pb	206.40	11.37	326°
Magnesium ...	Mg	24.36	1.74	750°
Manganese ...	Mn	54.80	8.00	1900°
Mercury	Hg	199.80	13.59	-39°
Nickel	Ni	58.60	8.80	1600°
Platinum	Pt	194.30	21.50	1775°
Silver	Ag	107.93	10.53	961°
Tin	Su	119.00	7.29	236°
Tungsten	W	184.00	19.10	higher than manganese
Zinc	Zu	64.90	7.15	418°

The color of a metal depends on its selective absorption of light waves of different wave lengths. Unless the light penetrates the metal, it is reflected and the metal looks white. The

METAL TRADES ASSOCIATION—METAL WORKING MACHINERY

selection of light rays may be from several parts of the spectrum; this is the case with copper which has a reddish hue. Anything which increases the absorption deepens the color. This can be done by reflecting a ray of light many times from two or more surfaces made of a given metal. Silversmiths and goldsmiths accomplish the same result by finely grooving a metal surface. Owing to this absorption of light by a metal the color of the light reflected differs from that transmitted. Thus gold can be made so thin that some light will get through. This light is bluish green, while as we all know, gold looks yellow. Silver is white by reflected light, while the transmitted light is blue.

Malleability is the property that permits a metal to be hammered or rolled into sheets. Ductility that which permits it to be drawn into wire. Both are dependent on the tenacity of the metal, the latter more than the former. The relative malleability and ductility of the principal metals is as follows:

Order	Malleability	Ductility
1	Gold	Gold
2	Silver	Silver
3	Copper	Platinum
4	Tin	Iron
5	Platinum	Nickel
6	Lead	Copper
7	Zinc	Zinc
8	Iron	Tin
9	Nickel	Lead

The mobility of the molecules of a metal is increased by temperature. Thus a coiled nickel wire may be made absolutely straight by suspending a weight from one end and heating the wire to white heat by the flame from an alcohol lamp or Bunsen burner. Zinc at its melting point is brittle, but at a temperature of 150° is quite malleable.

Metals can occlude gases. Thus a given volume of palladium cooled from red heat in hydrogen absorbs 900 times its volume of that gas. Hydrogen passes through red hot iron or platinum, and nascent hydrogen, assisted by atmospheric pressure will pass through a thin plate of cold iron as shown by Deville. A liquid metal can penetrate a solid; a bar of tin rubbed with mercury absorbs enough in a very short time to become brittle. A solid metal may penetrate another when both are cold. This can be shown with plates of gold and lead rolled together and allowed to stand.

For further information about the different metals, see ALUMINUM; ANTIMONY; IRON; LEAD; SILVER; etc.

SAMUEL SANFORD,
Assoc. Editor (Eng. & Min. Journal.)

Metal Trades Association, The National, an association of 220 firms in the metal trade, organized in 1899, for the purpose of resisting excessive demands of labor. The association will not arbitrate any question after a body of employees have declared a strike.

Metal Work, a form of decorative art in which the materials are metal and the methods casting and repoussé. The term includes jewelry (q.v.) and goldsmith's work; hence its materials are often the precious metals and its end, personal adornment. The more intensive use of the word makes it apply to larger work and especially to metal decoration in architecture, apparently a later development in the arts than was the jeweler's trade, which flourished in

classical antiquity, and everywhere seems to have quickly followed the most primary knowledge of metallurgy in industrial evolution. The Middle Ages was the great period of metal work, notably in connection with Gothic art. Even the more valuable metals were lavishly used in this epoch, as before in the Byzantine period, and since in the architecture of the Greek Church, above all in Russia. One of the foremost instances of Italian metal work is to be found in the altars of St. James at Pistoria and of the baptistery of St. John in Florence. Each of these was the work of a line of great artists, whose elaborate work upon them covered more than a century. Cellini (q.v.) was the greatest metal worker of the 16th century. Even more important than this work in silver and gold are the great bronze doors in the Florence baptistery, one by Ghiberti, and another by Pisano, each the product of a score of years of labor and both dating from the 15th century. Wrought iron work began to be used in the 12th century; between the 13th and the 18th centuries in the shape of gates, grilles and screens in ecclesiastical art, and in German locks and hinges of great beauty, it came to its most perfect form. The sepulchral brasses of German, French, and English churches should also be mentioned; see BRASSES, MONUMENTAL.

Metal Working Machinery, a term including practically all machines by which metals are converted into shapes required by modern structural work and the industrial trades. They may be conveniently arranged under the following named classes: Lathes; borers or drills; punches; shears; milling-machines; riveters; drop hammers; bending rolls; rolling machines; presses; planers; saws and special machines.

Lathes are turning machines used to obtain cylindrical surfaces by rotating a bar of metal against a cutting tool. The principal parts are the head stock holding the driving cone and revolving spindle; the tail stock supporting the back centre, and capable of being clamped at any point on the centre line of the bed or frame, and the rest or carriage bearing the tool head. The bar of metal to be worked is fastened to the head and tail stocks and rotated or turned by belts from shafting, or by electric motors, while the rest carrying the cutting tool is moved parallel with the axis of the bar from the surface of which a spiral shaving is removed. These machines are made in a great number of sizes, of which the principal forms may be designated as follows: (1) The Hand Lathe; without self-acting feeding devices for regulating the cutting tool, and in which the operation of turning is performed by hand tools; (2) The Foot Lathe; small and light, worked by the operator's foot and adaptable to work as delicate as that of the watchmaker and jeweler; (3) The Self Acting Lathe; in which the cutting tool is held by mechanical means causing it to move automatically over the object being turned; (4) The Chucking or Face Lathe; for turning cylinders several feet in diameter and many feet in length, such as engine cylinders and the tubing and jackets of large ordnance; (5) The Boring Lathe, used for working on internal cylindrical surfaces. Any lathe may belong to the single geared or back geared type. In the former the machine is not provided with gear wheel attachments to the revolving cone or stepped pulley

2. Steam Engine and Pump.

METAL WORKING MACHINERY

for regulating the speed of the spindle; while in the latter such attachments are provided.

150-Ton Fixed Riveter.

Borers or Drills.—Boring machines are of two types, the horizontal and the vertical. The cutting tool is an axially rotating spindle designed to bore or drill cylindrical holes. They vary greatly in size and form; in the number of spindles employed and the manner of their arrangement. In boring large holes, either horizontal, vertical or inclined, such as engine cylinders, tubing for ordnance, and hollow shafting, the machines usually have two or more separate spindles clamped in a cylindrical tool head. They are especially useful as reamers to finish holes made by punches, and also to give exact cylindrical forms to the internal surfaces of hollow castings of any kind.

Punches.—Punching machines are of the single or multiple type, capable of punching one or several holes at a time. They are used for punching rivet holes in boiler and armor plates, plates for girders and other structural metal work. The perforation is accomplished by the thrust of a cylindrical punch under great pressure instead of a rotating spindle. The power employed is steam or hydraulic, generated by individual engines for large and belt-driven machinery for small work.

Shears.—Shearing machines and punches are similar in general construction and operation, excepting that in the former cutting edges which pass each other like the blades of a pair of scissors take the place of the punching tool. Their name and action sufficiently describe the purposes for which they are used.

Milling Machines.—Are of great importance in the manufacture of iron work of small dimensions such as the small parts of sewing machines, rifles and pistols. In general construction, a frame-work carries a spindle actuated by a pulley, and a table upon which chucks or holding devices are arranged. Gear-wheel attachments to the cone pulley provide for changes of speed or greater driving power at the cutters. The advantages gained by their use are as follows: The rotary cutters insure a continuous cutting operation; the outlines of the work and the form of the cutting edges are exactly similar; once adjusted, all work is turned out uniform in size and shape, and any unlimited variety of shapes may be obtained by simply vary-

ing the form of the cutters, while the only special operating skill required is to maintain the form of the cutters, and set the work.

Riveters.—Riveting machines are made in two forms, stationary and portable; the former used in heavy work are operated by steam and hydraulic power, while in the portable form the moving die is actuated by steam or compressed air. They are employed to drive and head hot rivets in boiler work, bridge building and other structural work with results far superior to hand work in rapidity and efficiency. The usual form of construction is a U-shaped frame or yoke. The ends of the arms are provided with dies projecting inwardly, one being fixed while the other has a reciprocating motion. The rivet being placed in the hole is compressed endwise between the dies; the pressure forces the metal of the rivet into the irregular edge of the hole, clamps the plates together and forms the rivet head.

Drop Hammers.—Heavy drop hammers are used for forging purposes and are operated by hydraulic and steam power. They consist of an anvil fixed upon a solid base of steel blocks laid over oak timbers to give elasticity to the machine. Above the anvil vertical housings capped by steel arches support the hammering

Light Drop-Hammer.

ram and the platforms upon which the piston cylinder and other actuating machinery is placed. The largest hammer of this kind was erected in 1891 at Bethlehem (Pa.) Steel Works. Its general dimensions and weight are as follows: Height 90 feet; width 42 feet; weight of anvil and foundation 1,800 tons; weight of housings, steam chests, pressure cylinders and piston about 1,000 tons. Ram 19 feet long, 10 feet wide and 4 feet thick, weighing 100 tons. Lighter forms of drop hammers are actuated by compressed air and are called pneumatic hammers. They are used principally as cornice bending machines.

METALLOID—METALLURGY

Bending Rolls and Benders are used generally in boiler and tank work; the metal plates being drawn by rotation between three rolls arranged in the form of a triangle, their relative adjustment determining the curve to which the plate is bent.

Rolling Machines are used to flatten out metal bars into plates and shapes. As designed at present they accomplish in a short space of time a great variety of work which in times past was turned out by the more laborious and expensive processes of lathe turning and forging. One class is used to manufacture boiler and armor plate, and the general run of heavy sheet metal; while another class produces the thin sheet metal down to the finest grades such as tin-foil.

Tin-foil Rolling Mill.

Presses.—By the use of presses sheet metal is converted into utensils of any desired form. Their action depends on the principle that fluids exert an equal pressure in all directions, and that, if the pressure applied to the plunger of the force pump be multiplied by the square of the diameters of the plunger and the ram, the product will be the pressure applied to the ram. They are operated by steam, hydraulic or other power; are provided with dies between which the sheet metal is pressed into the required form, and are capable of being constructed to exert an unlimited amount of pressure. Forging presses are made in all sizes adapted for uses ranging from the pressing of watch-cases to the forging of steamship shafts, and of armor plates weighing 14,000 tons. They are designed for both hot and cold working metals.

Planers.—Planing machines are used to obtain flat surfaces on metal. There are two types; those in which the motion of the table relative to the cutting tool is rectilinear, and those in which that motion is rotary. In general construction a planer consists of a traversing table on which the work is fastened; a bed to receive the table and guide it in a right line; a cross slide to support the slide rest carrying the tool; standards bolted to the bed and supporting the cross slide, and the mechanical devices for feeding and regulating purposes. The power supplied from shafting by belts is transformed by gear wheel attachments into the reciprocating motion of the table, causing it to slide back and forth between the vertical guides, thus bringing the work against the cutting tool which shaves off successively, side by side, narrow thin strips of metal until a perfectly flat surface is produced. Planers are built in various sizes, the

larger machines being equipped with tables 7 to 8 feet in width and 20 feet long.

Saws.—In metal working, saws belong to the class commonly termed finishing machinery. For cutting plates and bars into shorter lengths they are in extensive use, affording a great economy of time. They are built in a great many sizes and forms, both stationary and portable, equipped with single cutters or cutters arranged in gangs. For cutting off large bars such as steel beams, rails and similar shapes, saws with single cutters are generally used, the object being fastened to a carriage and moved into contact with the edge of the circular cutter. Some machines used for lighter work are so arranged that the circular saws are moved into contact with the bars. The cutters are of two kinds. The friction disks made of soft mild steel, without teeth, measuring about 44 inches in diameter and 3-16 of an inch in thickness, are used for cutting off either hot or cold metal. They are run at a high rate of speed, about 15,000 feet per minute, rim velocity. The toothed cutters vary greatly in diameter and thickness; are made of highly tempered steel, and are used for clean cutting in cold metal. They are usually run at a low rate of speed the rim velocity varying from 130 to 150 feet per minute. Friction disks run at rim velocities between 20,000 and 25,000 feet per minute are called fusion disks, from the fact that the intense heat generated by the friction actually melts the metallic dust ground off by the cutter.

Special Machines.—This term includes an almost endless variety of metal working machinery, capable of enumeration only in a very general way. They are used for special purposes such as making pins, nails, rivets, and pens; the tapping of nuts and the threading of bolts. Although often of very complex construction they turn out work with great rapidity and precision. In its special field metal working machinery has not only replaced hand labor in all countries, and especially in the United States, but by its use, accomplishments have been achieved in structural work such as the building of magnificent buildings and bridges, powerful engines, and mammoth ships, far beyond the capabilities of that which is known industrially as hand labor.

W. MOREY, JR.,
Consulting Engineer, New York.

Metalloid (Gr. "metal-like"), in chemistry, any non-metallic element. These are 13, namely, sulphur, phosphorus, fluorine, chlorine, iodine, bromine, silicon, boron, carbon, nitrogen, hydrogen, oxygen, and selenium. The distinction between the metalloids and the metals is slight. The former, excepting selenium and phosphorus, do not have a "metallic" lustre; they are poorer conductors of heat and electricity, are generally not reflectors of light and not electropositive; that is, no metalloid fails of all these tests. The term seems to have been introduced into modern usage instead of non-metals for the very reason that there is no hard and fast line between metals and non-metals, so that "metal-like" or "resembling metals" is a better description of the class than the purely negative "non-metals." Originally it was applied to the non-metals which are solid at ordinary temperatures.

Metallurgy. Metallurgy deals with methods of separating metals from their ores and of

METAL WORKING MACHINERY

1. Planer.

2. Boring and Turning Machine.

METALLURGY

adapting metals to their commercial uses. It had its beginnings when men first wrought the metals; but was long an art rather than a science, in fact only within comparatively recent years has metallurgy had anything like a scientific basis, but to-day it covers a wide range of facts, and the trained metallurgist has a sound understanding of inorganic chemistry, physics and mechanics.

Of all metallurgical processes that of the separation of lead from its ores is one of the oldest. Lead smelting was known to the ancient Hebrews, and Schliemann found silver ornaments on the site of ancient Troy that were so pure as to show that the Trojans knew how to separate silver from lead by cupellation. Lead ores were wrought by the ancient Egyptians perhaps 3,000 years B.C. The ancient Greeks and Romans extracted gold, silver, iron, lead, copper, and tin, and the Romans made brass although they did not extract zinc from its ores. The alchemists of the Middle Ages did a vast amount of experimental work and made important discoveries. Thus Geber in 707 found that a given volume of metallic lead changed to lead oxide shows an increase in weight, but apparently he made little or no attempt to determine the reason for this increase, and like the later alchemists, passed by discoveries that might have been of high scientific value in the search for the fantastic and impossible. It is of interest to note that the study of the action of oxygen and the effects of heat have, more than anything else, extended our knowledge of the metals, that lead has furnished more experiments than any other metal and that the action of oxygen on lead has been more studied by chemists and metallurgists than any other in the whole realm of chemistry.

Metallurgy is the mother of chemistry, but there is to-day no sharp dividing line between the two. Both deal with reactions between elements, and these reactions can be expressed by symbols. Most chemical reactions take place at comparatively low temperatures, generally at or below the boiling point of water, while most metallurgical reactions have to do with much higher temperatures. It is difficult to govern conditions exactly in experiments at temperatures above a red heat, and as a difference of less than 50° in temperature will determine whether or not a given reaction takes place, metallurgical processes have not been developed with the exactness of chemical. Again the brilliant results achieved in organic chemistry during the past 50 years and the attention given that branch of science by investigators have tended to keep down the interest in metallurgy. Recently, however, there has been a change, and men of high skill and great knowledge have been investigating metallurgical problems, and much has been accomplished within the past 20 years. The names of Howe, Roberts-Austen, Mathiessen, and Le Chatelier may be mentioned in this connection. Metallurgy like chemistry has benefited by the applications of electricity, and in particular the electric furnace which permits of high temperatures and a fairly close control of conditions has vastly increased the range of experimental investigation. The study of metals and alloys by the microscope has also given a clearer idea of the constitution of metals, their behavior when cooling from fusion, when sub-

jected to stresses, cold, and particularly of the relations of the metals to each other in alloys.

Metallurgy thus covers the separation of ore and gangue, by mechanical methods (concentration or ore-dressing), the reduction of the ore to the metallic state by heat (smelting), or by methods which use electricity (electrometallurgy), the purification of metals (refining), and the study of the composition of alloys by the microscope (metallography). The methods used for the separation of commercially valuable minerals from the waste rock or gangue, and for the reduction of the ores of the various metals, differ and will not be taken up in detail here. Mention is made of them under the metals. (See ALUMINUM; COPPER; GOLD; LEAD.)

In general it may be said that the metallurgy of an ore depends on the physical character of the minerals and of the rocks in which they occur as well as on the chemical composition of the minerals. Metallurgical processes may be divided into mechanical and chemical. Under mechanical are included the various processes of ore dressing or concentration, the object of which is to separate nearly pure mineral (heads) from what is of little or no value (tailings). In this separation a third product (middlings) is often obtained which may be subjected to further concentration. This separation of mineral from gangue depends on the physical properties of the mineral, generally on its specific gravity, but in certain cases on its magnetism or even on the readiness with which oil adheres to it (Elmore process). The processes which depend on the differences in specific gravity between minerals are divided into two general classes, wet and dry. All the many devices and machines used in wet concentration cannot be mentioned here. In gold mining they include the miner's pan, one of the oldest of concentrating devices; the sluice with cross-pieces or riffles to stop heavy particles of gold, while the lighter clay, sand and gravel are washed over by the water.

In what is called a jig a mixture of heavy and lighter ore and minerals is fed to one compartment of a large box filled with water; by means of a piston a pulsating motion is given the water in the box and thus the minerals in the compartment are stratified, the lighter rise to the top and are removed while the heavier collect at the bottom and are also removed by some mechanical device. Jigs are for separating particles of some size. For the separation of smaller particles (sands or slimes) concentrating tables, or belts of various types are used, the principle common to all being the use of a thin sheet of water which washes off the lighter particles, while by rapid shocks given the belt or table the heavier particles are made to travel against or transversely to the flow of the water, and fall off the table at some distance from the waste rock. Particles of mineral too fine to be caught on tables are separated by running the water holding the fine mineral and waste in suspension through tanks so proportioned that the speed of flow is checked long enough to permit the heavier particles to settle.

Electro-magnetic methods, formerly used only for strongly magnetic minerals such as magnetite, are now, by employing powerful magnets, applied with much success to the separation of minerals differing but slightly in magnetism.

METAMERISM—METAMORPHIC ROCKS

In particular have magnetic methods proved valuable in the concentration of zinc ores, making rich concentrates out of ores that a few years ago could not be worked at a profit. Magnetic concentration is a dry process. Other dry processes depend on differences in specific gravity, a current of air instead of water being the medium used to sort the mineral particles.

The methods of extracting metals directly from the crude ore or from the mechanically separated concentrates fall into three classes: (1) extraction of the metal from oxides, carbonates, etc., by the reducing action of carbon, and the treatment of sulphides by the oxidation of the contained sulphur; (2) the extraction of a metal by getting it in solution and replacing it by another; (3) amalgamation. In the first class come the smelting of all iron, tin, gold, silver, and lead ores. Of replacement methods may be mentioned the precipitation of copper from a solution of copper sulphate by the use of iron, and the precipitation of gold from a solution of its cyanide by the use of metallic zinc. Amalgamation, used in the treatment of an ore containing free gold and silver, consists in bringing a finely crushed ore in contact with quicksilver, when the gold and silver particles form an amalgam with the quicksilver. The progress of electrometallurgy is developing wet processes which aim to separate the metal from the ore by a direct transfer of the metallic atoms or ions.

Most metals are obtained ultimately by the use of heat, either by treating the crude ore or by treating the concentrates obtained by some method of ore dressing. This application of heat may be either for roasting or for smelting an ore. The object of roasting is generally to prepare an ore for smelting by removing sulphur, though it may be the preliminary step, making the ore more porous, to the use of a leaching or lixiviation process, such as the leaching of copper ores by a solution of sulphurous acid or the leaching of gold ores by a solution of potassium cyanide. Roasting is done either by piling the ore in heaps with enough wood to start and maintain combustion of the sulphur (heap roasting) or in roasting furnaces. These are of a variety of types but are alike in having means for applying and regulating heat, regulating the supply of air to combine with the sulphur in the ore, and means for mixing and keeping the ore in motion that the reaction may proceed evenly. A perfect dead roast, that is, the complete oxidation of the sulphur in a sulphur-bearing mineral, is seldom obtained. In what is known as chloridizing roasting, the mineral to be extracted is changed to a chloride by adding common salt to the furnace charge.

Smelting is done in furnaces either of the hearth, shaft, reverberatory or closed-vessel types. The commonest type of shaft furnace is the blast furnace used in smelting iron ores. Ore, limestone and fuel are fed in at the top while hot air is forced through openings near the bottom, the molten iron being led off below. In reverberatory furnaces the fuel is burned in a separate fire-box and its flame is made to play over a horizontal hearth on which the ore lies. Some roasting furnaces give a reverberatory effect and do not smelt simply because a high temperature is not used. Reverberatory furnaces are used in smelting lead and

copper ores. In closed-vessel furnaces the ore is contained in a pot or similar receptacle made of a silicious clay or other infusible material and the heat applied externally. Furnaces of this sort are used in smelting zinc ores.

To the ore put in a smelting furnace is often added a certain calculated amount of limestone, iron ore or other material, to act as a flux, that is, to combine with the silica, alumina, etc., forming a readily fusible mixture or slag. This is lighter than the molten metal and floats upon it. Hence the slag and metal can be tapped separately from the furnace.

For the metallurgical processes used with the different metals see ALUMINUM, ANTIMONY, ELECTRO-CHEMICAL INDUSTRIES, etc. Consult also Percy's 'Metallurgy' (1875), and Roberts-Austen's 'Introduction to the Study of Metallurgy' (1902).

SAMUEL SANFORD,
Assoc. Editor 'Eng. & Min. Journal.'

Metamerism. When two or more chemical compounds have the same empirical formula, but consist of different radicals united by an element (or a radical) that is common to them all, the compounds are said to be "metameric," and the property itself is called "metamerism." The common element that unites the radicals is usually oxygen or nitrogen. Good examples of metamerism are afforded by the compound ethers and amines. Dipropyl ether, methyl-amylyl ether, and ethyl-butyl ether, for example, all have the empirical formula $C_6H_{12}O$; but dipropyl ether contains two propyl radicals (C_3H_7), methyl-amylyl ether contains one radical of methyl (CH_3), and one of amylyl (C_5H_{11}), and ethyl-butyl ether contains one radical of ethyl (C_2H_5) and one of butyl (C_4H_9); the two radicals being connected, in each case, by an oxygen atom. The structural formulæ of these respective compounds are therefore as follows:

Dipropyl ether.	Methyl-amylyl ether.	Ethyl-butyl ether.
$C_3H_7 > O$	$CH_3 > O$	$C_2H_5 > O$
C_3H_7	C_5H_{11}	C_4H_9

The following amines, which all have the empirical formula $C_6H_{15}N$, illustrate metamerism in which nitrogen is the connecting element:

Propylamine. Methylethylamine. Trimethylamine.

$N \begin{cases} C_3H_7 \\ H \end{cases}$	$N \begin{cases} CH_3 \\ C_2H_5 \\ H \end{cases}$	$N \begin{cases} CH_3 \\ CH_3 \\ CH_3 \end{cases}$
---	---	--

Metamerism may be regarded as a species of accidental isomerism. When metameric compounds are treated with reagents which destroy the bonds between the constituent radicals and the atoms (of oxygen or nitrogen) by which they are united, the several members of the metameric group that is so treated yield totally different products, because they contain totally different radicals.

Metamorphic Rocks, in geology, those rocks whose present form is the result of far-reaching and extreme change, the most frequent metamorphosis being an increase in hardness and in crystalline formation. Thus, both volcanic and sedimentary rocks have been greatly altered. Metamorphic igneous rocks have the original textures characteristic of igneous rocks partially obscured by fissile planes. Metamorphic sedimentary rocks have more clearly the character of the unaltered original in composition; and they furnish the commonest examples

METAMORPHISM—METAMORPHOSIS IN ANIMALS

of metamorphism, namely slate, an altered form of argillaceous rocks, and marble, a metamorphosed limestone. The third class of metamorphic rocks is that whose origin is not clearly traced. See METAMORPHISM.

Metamorphism (Gr. "alteration"), a lithological change, especially chemical alteration and rearrangement, exclusive of the chemical change due to atmospheric action, the product of which is styled residual and not metamorphic. Metamorphism is a more profound change than that effected by decomposition or weathering. Its nature is uncertain, but its result is in general an increase in hardness and in crystallization. See METAMORPHIC ROCKS.

Metamorphism is "contact" or "regional." Contact alteration is due to the near presence of intrusive rock, usually igneous; in this way it is supposed that shales and slates were metamorphosed from argillaceous matter. Regional alteration is the result of movements of the rocks changed and of the areas they occupy; hence it is frequently styled dynamical metamorphism. Under this influence the rock passes through various stages, first hardening, and then becoming crystallized (or re-crystallized), usually with increased schistosity. See GEOLOGY.

Metamorphosis in Animals, the changes which in many animals take place between the time of birth and maturity. The causes are most probably changes of habitat, of seasons, of food, and the acceleration in growth resulting from the approach of sexual maturity. Familiar examples are the change of the caterpillar into the butterfly, of the tadpole into the toad or frog.

In the frog and toad, metamorphosis is complete and thoroughgoing. The embryo on hatching from the egg has a large head and body, but no tail; in a few days its tail grows out and it becomes a tadpole, when it is fish-like, but without fins or limbs. With the growth of the tail, the external gills appear, and the mouth is formed, while the intestine becomes very long and closely coiled. The mouth is armed with horny, comb-like plates, on which develop great numbers of microscopic teeth, which are shed continuously. In changing from the tadpole to the toad or frog, the body, including the skull and rest of the skeleton, and the viscera are made over anew; the external gills disappear as the lungs develop, the true teeth appear in the jaw, the intestine becomes short and straight, and the creature instead of nibbling decaying leaves or dead animals, feeds on living snails and insects. Soon the front legs bud out, the tail becomes absorbed, finally the hind legs grow out, the gills disappear and the adult form is attained. While most amphibians pass through such a metamorphosis, in a few forms, owing to the absence of water or other changes in the environment, development is direct, the metamorphosis being suppressed. Metamorphosis may be retarded by cold, and shortened by hunger, and in the amphibians or in insects the changes are greatest in modern and specialized forms, as frogs and toads.

The metamorphosis of the butterfly is the most complete of those of all insects. The life of the insects is divided into four stages, that is, the egg, larva, pupa, and imago or adult. During the larval and pupal periods the insect is, so to speak, a different animal from the adult.

The caterpillar is provided with big jaws and eats voraciously; in shape and structure it differs widely from the winged adult. The pupa or chrysalis is also different from the larva, and also from the imago; it takes no food and rests almost motionless. On the other hand, the butterfly has no jaws, while its maxillae form a long coiled up tongue beautifully adapted for probing the corollas of flowers. Though these changes appear to be sudden, the internal alterations of cells and tissue which lead to them are gradual. From one to three days before assuming the pupa state the caterpillar becomes restless and stops eating. If a spinner it spins a cocoon, or if not it enters the earth to undergo its transformation into a chrysalis, or if a larval butterfly it attaches itself to some fixed object as a tree or fence. Profound changes now take place in the mouth-parts as well as the nervous, muscular and other systems of internal organs.

But the changes are most marked in the flesh-flies and their allies. At the end of the maggot-stage, the internal organs are destroyed, breaking up and forming a creamy mass, and the appendages and wings arise from minute internal masses of cells called "imaginal buds" which are present in the maggot. The body is thus entirely made over anew. But while the process of destruction of the larval organs and appendages goes on, there is also a constructive process, during which the organs of the adult state are being built up. It is thus evident that the sharp division of the life-history of the insect into larval, pupal and imaginal stages only applies to the external surface of the body. The internal processes of development, on the other hand, form a continuous series of transformations between which is no sharp line of demarcation. Yet as a whole the forms of the larva, pupa, and imago are kept distinct in adaptation to their separate environments and habits.

Hypermetamorphosis.—This name is applied to the changes undergone by certain beetles (*Meloë*, *Stylops*, etc.), in which there are more than the usual number of larval and resting or pupal stages. Thus in the common oil-beetle (*Meloë*) and in the blister-beetles (*Epicauta*) the larva hatches as a minute, active, triungulin creature which is a parasite in bees' nests, feeding on their eggs; it passes into a second larval stage, when it is grub-like, inactive, the body being thick, cylindrical, soft and fleshy; this passes into a motionless semipupa, and thus after molting assumes a footless larval form; it then transforms into a true pupa like that of other beetles. There are thus four distinct larval stages, besides the pupa and beetle. Now these stages correspond to the habits and food of the young beetle, and these supernumerary stages and marked changes of form are evidently due to changes of environment, of habits, and of food, resulting in the atrophy of limbs in certain stages. This throws light on the causes of metamorphism in general.

No Distinct Metamorphosis in the Primitive Insects.—The wingless insects (*Synaptera*) do not pass through a metamorphosis. And it appears, as first suggested by Fritz Müller, that the habit of metamorphosing is an acquired one. Thus in the more primitive winged insects, such as the cockroach, grasshopper, bugs, etc., metamorphosis is incomplete, the young differing mainly from the adult in not having wings. Also the most primitive arthropod animals such as

METAPHOSPHORIC ACID — METAPHYSICS

the horse foot crab (q.v.), the spiders and myriapods, pass through no metamorphosis.

Metamorphosis in the Lower Animals.—The more specialized coelenterates (*Medusæ*), the echinoderms, mollusks and crustaceans, as well as many worms, undergo remarkable changes of form. (See LARVA.) The larva of the marine annelids is a top-shaped ciliated creature (*trochosphere*) entirely different from its parent. The marine mollusks pass through a larval condition (*veliges*). The young of the sea-urchin, starfish and holothurians differ remarkably from their parents in being bilaterally symmetrical, transparent, and free-swimming; they serve as scaffolds from which the body of the adult is developed. The shrimps, etc., are hatched in a nauplius or six-legged form, and crabs in a zoea form.

Metaphysics. Metaphysical reflection began with Parmenides of Elca, who, not finding the phenomenalism of the Ionians, or the more formal reflection of the Pythagorean School, satisfactory, was led to deny the reality of the whole world of appearance and to penetrate deeper in his search for the real. In doing so he observed that while the objects of sense are always changing, it is the very essence of thought that it should seize its object as a place of rest and deal with it as a fixity. Τὸ ὄν then, or being, is the permanent and the one. Metaphysically, the world is static and unitary, and the vision which the senses give of it as a plurality of phenomena in a state of incessant motion and change, is illusion. Zeno, another member of the school, developed his dialectic in order to prove the self-contradictoriness of plurality and motion. Plato is at one with Parmenides in regarding being as the object of thought, and as therefore fixed and static in its character. But Plato has also learned the lesson of "becoming" from Heraclitus, and meets the destructive dilemmas of the latter by affirming that being is not one but many, and that the world-process to which Plato ascribes a degree of reality arises from the introduction of the stable or determinate world-elements or ideas into a formless matter, or ὄλη, which stubbornly resists the form-giving principle and thus gives rise to the movement or process of the world. But Plato is still so far in bondage to the Eleatic tradition that he regards the ideas, or metaphysical reals, as eternal archetypes prior to the individual beings of the world, and only entering into these beings under the pressure of some *Deus ex machina*. Thus, in the 'Timæus,' he represents his Demiurge as compounding things out of the ideas as patterns, and the resisting and formless matter. Aristotle overcomes the Platonic dualism by an act that completely emancipates him from the Eleatic tradition. He translates Plato's ideas into forms, endows them with dynamic quality and conceives them to be the immanent principles of the world's order and movement. He is then able to translate the notion of being into terms of becoming, without depriving it of its fixed and stable character. The world of Aristotle is just as much a flux as that of Heraclitus, but Aristotle has an intuition which the older thinker lacked. He sees that the flux itself is

not lawless, but in a sense predetermined, as a passage from the potential to the actual. There is an inner nature of things which constitutes their immanent destiny, and this going on to realize itself determines the whole constitution and process of the world. From this point of view all the terms of Aristotle's metaphysics are to be construed. Matter is simply the world-system regarded as a possibility; form is the same system as actual. ἡδύναμις, potentiality, expresses the material aspect and the material elements of things; ἐνέργεια, potentiality realized, their actuality, life and movement. The four causes are simply the sum total of conditions material and formal which determine the passage of things from mere potency to actuality. God is the immanent nature, the spring of self-activity, that mediates and determines the world-evolution from the potential to the actual. He is the completely actualized world.

It may be very truly said that the metaphysical intuition of the ancients completed itself in Aristotle. Neo-Platonism contains no real advance on old Platonism, and the mediæval metaphysics that culminated in the system of Saint Thomas does not in any important sense transcend that of Aristotle. In modern times the first real effort toward metaphysical advance is found in the thought of Spinoza. This celebrated thinker is the first to effectually call in question the metaphysical presumption of the ancients that the real is the immediate object of thought. Spinoza rebels against the dualism that represents the real as composed of thoughts and things corresponding to them. He proposes that there shall be only thought and its content. For Spinoza does not identify his two terms in the sense that he regards thinking and being as identical. The world of Spinoza is static, non-dynamic; and the two aspects of it, as he sees it, are (1) thought, regarded as a form of intellection; (2) being, regarded as the immanent object, that is, the content of intellection. God or *Natura naturans* is the world viewed from the standpoint of intellection; Nature or *Natura naturata* is the world viewed objectively as the content of intellection. As objective content, it is manifestation or outer phenomenon; as subjective thought or intellection, it is inner nature or God. If we add to this the fact that the thought of Spinoza is universal rather than individual, we will have noted all the essential terms of his metaphysics which may be characterized as a species of Pantheistic Monism. What is most distinctive in the thought of Kant is his definite and final occupation of the standpoint of epistemology, as the true ground for the determination of the problems of metaphysics. Now in so doing, Kant is making thought the measure of reality, and this seems to be only repeating the judgment of Spinoza. But there is a great difference. Kant declines to accept Spinoza's doctrine of thought and reality. The real is more than the content of thought. In fact Kant returns to the ancient intuition of thought as formal, and the real as in some sense its correspondent. This was also the tradition of Locke and his school, from which Hume departed, and fell, as a result, into skepticism. Now the history of Kant's thought shows that, while he clung to the belief in the mere formal character of thought, his tendency was also strongly in the direction of skepticism. More-

METAPHYSICS

over it was on account of his failure to completely achieve what he calls his Copernican revolution, and which was in fact a reaction toward a constitutive doctrine of thought, that he was never able, during the whole of his critical period, to reach a satisfactory conception of the relation of thought to reality. Had Kant completely achieved the mental revolution he proposed, the result would have been, that in epistemology he would have reasserted the doctrine of Spinoza, the identity of the real with the content of thought. The knowable world would thus have been identical with the real world and Kant would have escaped the dualism between knowledge and reality into which he actually fell. Kant also denies the universality of thought; at least in the ontological sense. The thought that functions epistemologically is my human relative thought which can only pronounce judgments that are subjectively valid for me, but have no ontological value for reality. The Kantian metaphysics is a corollary from his epistemology. What Kant calls critical idealism is first an epistemology, secondly a metaphysic. As an epistemology it teaches that my thought is constitutive for me; that is, that its content is valid for my subjective connation. It gives me a world, in other words, in which I can work out the practical issues of my life, but it does not give me the world of real things in themselves with respect to which my attitude must be one of renunciation. As a metaphysic critical idealism simply carries its programme out in the field of ontology. The presumption of the identity of what is thought with the real cannot be carried out objectively. Kant's metaphysics is therefore necessarily negative. Thought is able to complete itself ontologically, it is true, but the ideals it reaches have no other than subjective value. Their hypothetical content can never be identified with the real, and the Kantian is per force obliged to represent the whole ontological region as an indeterminate X and to look for the satisfaction of his wants to extra-metaphysical forces. In Hegel we have also an example of a thinker who approaches metaphysics along the epistemological way. But Hegel is a much more thorough-going thinker than Kant. He starts no doubt with the Kantian traditions in mind and his first great task, the development of his logic, is formal. But Hegel is not a formal thinker, in the sense that he divorces content and form. Thought is formal. This Hegel is not afraid to confess, but it is also ontological. At the same time there are no outlying realities, like the Kantian things in themselves. How is this? Are we to have the spectacle of a lapse into Spinoza? Our apprehensions are ungrounded, for Hegel asserts calmly that the form creates the content. Hegel asserts the identity of thought and reality in the sense that the real is, and is only, what the thought thinks it to be. It is the real by virtue of the thought thinking it to be. This sounds like a dangerous kind of subjectivity, till we learn that by thought Hegel means, not my thought or yours, as simply my or your intellectual function, but the thought that is universal and that thinks the universal. So much for Hegel's epistemology. In Hegel's system epistemology and metaphysics are simply two aspects of the same thing. In epistemology we have the system logically conceived; that is

in view of the process which the finite thought of the individual must pass through in order to apprehend it; whereas in the metaphysics we have the system presented in its unity as a self-completing whole. Epistemologically the dialectic is the movement by which results are achieved; metaphysically it is the Divine Spirit of the system as a whole. After Hegel there is no other thinker of great metaphysical significance, except Lotze, in whom we have a reversion to the Kantian tradition in regard to the formal character of thought. Like Kant, Lotze is primarily an epistemologist, and he adheres to the formal character of thought in the Kantian sense; that is, in the sense of Kant's actual achievement in which the Copernican revolution is left incomplete. Lotze not only asserts the formal character of thinking, but also more distinctively than did Kant, the distinctness of the order of thought from the order of things. The great question in epistemology for Lotze is, how the order of thought is to be made valid for the order of things. Now we are directly concerned with epistemology here, and can only stop to indicate that this is to be achieved by a kind of breaking in of the real order on the order of thought at various points; in short by the working of an epistemological miracle. It is true that Lotze attempts to buttress his miraculous intervention with the *a priori* necessities of thought itself; an attempt which supplies an interesting topic for criticism. The nexus between the Lotzean epistemology and metaphysics is to be found in the conclusion of the former; namely, that the order of thought may be taken as valid for the order of reality and consequently thought may be employed as an agent of metaphysical judgments. From this point the Lotzean metaphysics may be summarized as follows: Starting with Kant's doctrine of things in themselves, Lotze is dissatisfied with their negative and indeterminate character. This leads him back of Kant to Leibnitz in whose monads he finds conceptions of reals which have a determinate nature and which are, therefore, to some extent knowable. Fundamentally, however, this monadology is a system of pure pluralism. The reals are independent and relationless. Leibnitz is nowhere able to overcome the atomism of his system. Now Lotze, in adopting the Leibnitzian real, modifies it by conceiving it, after the analogy of sociality, as internally susceptible to modification from its fellow reals. The form which this susceptibility takes is the dynamic one of interaction. Out of the mutual and reciprocal interactions of the metaphysical reals emerge all the movements and changes that make up the phenomenal world. Lotze also qualifies the pluralism of Leibnitz by postulating, as the necessary ground of the existence and unity of things, a universal substance or unitary being, which supplies the absolute term in the metaphysical conception of the world. This absolute is open to two criticisms that may be simply indicated here. Ontologically it threatens a return to the Pantheism of Spinoza, while epistemologically it is in danger of succumbing to the pluralism for which it was postulated as a cure.

II. All metaphysics arises out of the question whether thought is adequate to the apprehension of reality. This question may be answered

METAPHYSICS

either negatively or affirmatively, and each of these answers will have two generic forms. The negative answer will take the form either of skepticism or agnosticism, while the positive answers may be characterized as materialism or spiritualism. The first form of negation, skepticism, will arise either directly out of a dogmatic denial by reason of its own powers, or, as is more often the case, from the standpoint of sensationalism. In general, it may be said, that ancient skepticism was dogmatic; while modern forms are as a rule sensational. Thus, the earliest form of skepticism on record, that of Heraclitus, arose immediately out of the perception that a system of perpetual flux supplies no points of sufficient stability for the judgment, so that while being pronounced it loses its ground. Could Heraclitus have discovered a single point of rest in his world he would have been in a position to become a positive thinker. The early Sophists became skeptical because they had lost faith in reason. The first proposition of Gorgias was that nothing exists; meaning, that our thought or reason supplies us with no rational data for asserting anything to exist. The other propositions of his negative creed depend on this ontological pronouncement and have little relevancy apart from it. Coming down to Pyrrho and the later skeptics of the Academic School, we find that their skepticism, while differing in degrees, has this one point of agreement that the object of its denial is the ontological value of thought or reason. Thus, while Pyrrho seems more radical in his negations than the Academic of Cicero's time, the reason is psychological rather than metaphysical and is to be found in the development of the category of probability which came gradually into vicarious service for reason. The judgment of probability thus gradually asserts itself as an organ of certitude, and we find Cicero restating all the Platonic proofs of immortality in order to establish its probability. Modern skepticism, of which that of Hume may be taken as representative, springs directly out of sensational soil. Hume asserts that all real data of knowledge are sensible; consequently reason, which professes to go beyond sense and assert the metaphysical, is a faculty of illusion. Metaphysics is therefore a science of illusion and the judgment of reason is valueless; except so far as it can find its guarantee in the data of sense. The Humian, as a rule, becomes sceptical of reason for its own sake; but the ground of his denial of the value of his ontological judgments will be to seek in his already adopted sensational criteria of reality. There are modern forms of metaphysical skepticism that do not spring directly out of sensational soil, as for example that of Kant which finds its immediate motive in the inevitable self-contradictions into which reason is said to become involved in dealing with metaphysical issues. Kant, however, is not to be ranked as a skeptic, but rather as an agnostic. The term Agnosticism, as well as the thing it signifies, is a distinctive product of the modern mind. It could arise only after a critique of recognition had shown that dogmatic negations of an ontological character are without value; in other words, that no *a priori* limits to existence can be determined. Having reached this insight the agnostic is the one who finds, in this inability of reason to determine the negative limits of

existence, evidence of its inability on the positive side to determine the nature of existence. The starting point of agnosticism is thus epistemological; it is primarily a question of knowledge, but in the last analysis its motive is metaphysical. Agnosticism is a name for the denial that metaphysical reality can be satisfactorily asserted. In modern thought it has taken two forms: the one, which has allied itself with Positivism, taking the radically phenomenistic ground that neither the existence nor the nature of what Mr. Lewes has styled the suprasensible can be affirmed; the other form being that of Herbert Spencer and his school, in which the existence of the metaphysical is asserted, but the possibility of intelligently defining its nature is denied. Of this species of negation Kant is the progenitor in the general position which he develops in the third section of his great work, the 'Critique of Pure Reason.' Here he maintains the necessity of postulating in thought the existence of the metaphysical objects, while denying to such postulates ontological validity.

On its positive side metaphysics has tended to be either materialistic or spiritualistic. Metaphysical materialism is a theory that admits the competence of reason to determine the ultimate nature of the real. Its distinctive feature is its assertion that the original type of being to which the world is to be reduced is to be found in the object rather than in the subject, in matter rather than in mind. Such a doctrine may be crudely phenomenal, like the hylozoic theories of the Ionians. It may be ontological and mechanical, like ancient atomism and its modern counterparts, in which the attempt is made to conceive the mechanical evolution of the world out of the movements of the pure material elements. Or it may find its objective term in the nervous system and its metaphysics be a postulate of brain psychology. On whatever data it essays to build, matter rather than mind will supply it with its ontological categories and types of being. Thought, wherever it may show itself, will not be regarded as a *vera causa* but rather as a phenomenon or even an epi-phenomenon of the material. The modern forms of materialism are more subtle than the ancient, and they are less dogmatic in their tone; this result arising partly no doubt from the confessed inability of a materialistic metaphysics to deal rationally with many of the vital concerns of humanity.

Materialism stands, on the whole, discredited before the bar of modern thought. The insight of the modern mind is one that owes more to Plato and Aristotle than to Democritus. Its metaphysical systems have for the most part been spiritualistic, if we use that term in the broad philosophical sense. Now we have defined materialism in the light of its ontological character, and spiritualism may be defined in the same way as a metaphysical construction of the world that seeks its ultimate categories and types of being in mind rather than in matter. The first genuine spiritualistic insight which the history of philosophy records is that of Anaxagoras, who finds in thought or intelligence the only principle that can supply an adequate explanation of the order and unity of the world. This germ is developed by Socrates, Plato, and Aristotle into a system of thought that may be called spiritual idealism. Modern spiritualism has embodied itself in both realistic and idealistic

METAPHYSICS

tic forms. Under the former we may note, first, Scottish realism, in which on an intuitional epistemology, a spiritualistic metaphysics of a pronounced theistic type is built; secondly, the German school of transcendental realists beginning with Herbart and completing itself in Lotze. This school, as we saw in another connection, rests on a Kantian epistemology, but through the mediation of the Leibnitzian monad achieves a thoroughly spiritualistic metaphysics of reality. The idealistic forms have played, on the whole, a more important role in modern thought than have the realistic. Space will permit only a brief mention of three of these forms. First, Berkeleyanism, which proceeds from the empirical epistemology of Locke to a spiritualistic and distinctively theistic metaphysics; secondly, the movement called transcendental idealism starting with Fichte's moral egoism and culminating in the absolute idealism of Hegel, a system in which epistemology and metaphysics are related to each other as thought and content. Later developments of Hegelism have received the name of speculative idealism, a rubric under which it is possible to include such diverse thinkers as Edward Caird, F. H. Bradley, and Josiah Royce. The third form is that of Schopenhauer and may be called voluntarism. This form finding its types and analogies in will, rather than in thought, leads to a metaphysical doctrine of the world, in which the will holds a central place. The voluntaristic type of idealism is one that tends either toward the metaphysical ideal indicated; or setting aside the distinctively metaphysical motive, it may under the name of Pragmatism seek to construct a theory that will combine the purely phenomenalist with the practical.

III. Attention has been called above to the widespread negative attitude that has been taken, in modern times especially, toward metaphysics. This has been caused partly by the despair of philosophers of ever arriving at results on which men could come to definite agreement. This despair has been reinforced from the outside by the wholesale denial of the value of metaphysics that has been indulged in by men of science. We are not concerned with this situation further than to call attention to it, and to infer from it the possible necessity of developing a concept of metaphysics that will make the connection of the metaphysical enterprise with experience, and with the investigations of science, more obvious than they have been made by the older conceptions. Let us start with the presumption that neither science nor metaphysics exists by any divine right, but are instruments which man employs in order to satisfy his demands and interpret his experience. Man finds himself related through his experience to a world which he seeks to penetrate by his intelligence and overcome by his will, in order that it may become the means of the realization of the ends of his existence. This struggle antedates both science and metaphysics. And as the physical needs are most clamorous, the first efforts will be devoted largely to their satisfaction; and it will be only through the physical struggle for existence that man will begin to recognize himself as a subject of spiritual experiences and needs. Naturally, then, the first need of man in order to supplement his ordinary experience will be science that will enable him to increase

his command over the forces and resources of nature. But just as the physical struggle awakes the spiritual in man, so the effort of science to penetrate the physical secrets of nature will lead to points where the physical will be transcended and the necessity of the spiritual interpretation will assert itself. In order to show how normal the demand for the metaphysical is, it is only necessary for us to realize clearly the standpoint and method of its rise. To this end, let us consider briefly the points of view, categories and methods employed respectively by science and metaphysics. Reverting to our representation of man as a being who seeks through his experiences to penetrate and overcome his world, we find, by considering his situation, that there are at least two points of departure from which he sets out to actively overcome his world. The first and most obvious is the external and objective in which, taking the position of an observer or spectator, he observes the movements of his world, with a view to generalizing them and, through these generalizations, getting command of the underlying forces or agencies of which the movements are the phenomena. Now this standpoint is the identical one occupied by science, and the presumption with which it sets out is that of non-community of nature between the investigating subject and the object investigated. In other words, the consciousness that observes the object must be careful to abstain from any and every assumption that the nature of its object may be conscious like itself. The investigator must, in short, restrict his activity to observing the conduct or movements of things in their pure externality, uncolored by any presumption as to what the things they manifest may be in themselves. The most obvious categories in this stage will be those of space, time, and motion and the method will be physical and mechanical. As the scientific construction advances the necessity for something deeper than this will, of course, arise. The motions of things, of themselves, are mere phenomena until they have been connected by the notion of cause, to the persistent but hidden agencies to which science applies the term forces; or in their aggregate, matter. In short, science, in order to justify its own procedure, must at a certain point rationalize its world by connecting the outer movements, with which it deals directly as symbols or phenomena, with a system of underlying grounds or forces. These forces themselves will be construed, however, by science as physical, therefore as spatial, and their relations will be quantitatively, that is, purely externally and mechanically, conceived. Science will thus end as she began, an instrument for the interpretation of the world in the terms of the physical. And this character will be maintained even when the object investigated is mind itself, for then the psycho-physical parallelism will be introduced as a means of translating all mental phenomena into physical equivalents.

In all this effort to explain its world, however, the subject has abstained conspicuously from the employment of its own analogies in the interpretation of its world. We are led naturally to ask, is there not a legitimate and necessary function somewhere for these analogies to perform? and our question leads to the discovery that there is another point of view in experience, beside that from which man spec-

METAPHYSICS

tates his world, and that is the central standpoint in consciousness, from which his consciousness goes out in its volitional effort to overcome and realize its world. The effort here takes the form of the agency of a conscious self and this agency embodies itself in teleological rather than mechanical form; that is, in a process that is motivated by an ideally formed interest, which, through the mediation of purpose, passes on to the realization of an end. This end is the ideal embodied in the purpose, and conceived in the ideally formed interest. A man has only to study his self-activity, as involved in his volitional agency, in order to realize the truth of this description. Now, just as we saw that science seizes upon the standpoint of outer observation, and translates it into an organ for the physical interpretation of the world; so here metaphysics lays hold of this inner movement of realization and translates it into an organ of spiritual interpretation. And, as science employs the analogies of the physical alone, on the assumption that the object is alien to the nature of the consciousness, so here metaphysics employs the analogies of the spiritual, on the presumption of a community of nature between its object and consciousness. The standpoint of metaphysics is, then, that of the inner conscious effort that springs directly out of our self-hood. The categories of metaphysics are those of ideapurpose, and end-realization, and it is of teleological rather than mechanical interpretation.

Having indicated as briefly as possible the most characteristic features of what we call the metaphysical interpretation of things we are in a position to consider two questions: (1) the real connection of science and metaphysics; and (2) the relation of metaphysics to general philosophy. As to the first question, the relation of the two disciplines is so obviously not one of conflict or mutual exclusion, but rather of complement and mutual completion, as to give to the persistent blindness that reigns in some quarters a certain air of absurdity. The foes that are being girded exist only in imagination. But seriously speaking, the motive of metaphysics is that and that alone which animates any serious-minded man when finding the physical world too narrow and cramping, in his effort to achieve an interpretation of things that will leave more scope and freedom for the realization of that which he cannot but deem highest, uses as a key to this interpretation the categories of a nature that lives and consciously aspires in his own breast. Man needs the metaphysical interpretation, whether he be consciously a metaphysician or not; and the man of science, if he be gifted with reflective powers and some insight into experience, will be the last to cast a stone at a discipline for which he so clearly prepares the way. (2) The relation of metaphysics to general philosophy may be expressed in various ways. In the first place by way of inclusion; philosophy embraces epistemology as well as metaphysics. Or if we have regard to the disciplines ordinarily included under philosophy, then metaphysics will find itself in company with psychology, ethics, logic, æsthetics, and the philosophy of religion. Here, however, the vital category is not inclusion but synthesis. The comparison of the aims and methods of science and metaphysics teaches us that neither alone is adequate to meet the demands of man,

or to completely interpret the world. The demand of knowledge, as well as the demand of our practical interests, is for a synthesis of the insights, methods, and results of science and metaphysics. This synthesis, in which the unity of knowledge and life is realized, is the function of philosophy. True philosophy conserves the needs both of science and metaphysics.

In view of the skepticism with which they are often met, the central task of metaphysics becomes that of enforcing the legitimacy of its own interpretation. So long as the claims of metaphysics are debated in connection with the abstract questions of existence and reality or universality and individuality, there may be difficulty in maintaining them against the objections of either science or common sense. Let us, however, set out by understanding the demand for the metaphysical interpretation of things arises in the experience of both the plain man and the man of science, and that it takes the form of a refusal to be satisfied with a world in which the first as well as the last issues are strictly and fatalistically determined by material forces and agencies; in short, with a world from which forethought and will are rigidly excluded. This refusal rests on man's conviction that it is in this field of conscious thought and will-determination that the most vital interests and most fundamental issues of his being arise, and that to those a mechanically-determined world would be indifferent, if not inimical. Once convinced of this, the mind of the most determined foe of the traditional metaphysics will be prepared to admit that a very natural and legitimate interest attaches to the question whether the scheme of world-interpretation may not be so enlarged as to include the problem of the co-ordination of the two spheres of experience: that of material and mechanical agencies on the one hand, and that of the agency of forethought and purpose on the other. If the legitimacy of such a consideration be conceded, the whole problem of metaphysics is on our hands, for the claim of metaphysics is simply that an adequate conception of things is one in which forethought and purpose are to be regarded as necessary pre-suppositions of the material and mechanical. In view of this we may add to Mr. Bradley's definition of metaphysics as "an unusually stubborn effort to think clearly," this other that metaphysics is an unusually stubborn refusal to admit the adequacy of a world-theory that does not refer the world in the last analysis to forethought and purpose.

METARGON — METEORITES

Metar'gon, a gaseous substance obtained, apparently from the atmosphere, in the experiments of Ramsay and Travers upon argon and krypton (qq.v.). It was for a time believed to be a new element, but was later shown to be merely carbon monoxid, which had been introduced by the unsuspected presence of carbon in the phosphorus that they had used for depriving the air of its oxygen.

Metastasio, Pietro, pē-ā'trō mā-tās-tā'zē-ō (properly PIETRO TRAPASSI), Italian poet: b. Rome 6 Jan. 1698; d. Vienna 12 April 1782. His poetical talents were early displayed in improvisations, and often he drew about him a crowd to listen to some versified narrative. The jurist Gravina, who thus accidentally became acquainted with his talents, took him under his protection, called him (by an Italianized translation of his name into Greek) *Metastasio*, paid great attention to his education, and on dying in 1717, left him an estate of \$20,000. On 15 April 1718 he was received into the Arcadian Academy with the name of Artino Corasio, and in 1720 entered at Naples the office of the attorney Castagnola, who discountenanced literary work, and kept him severely to the law. He wrote anonymously 'Gli Orti Esperidi' (1722), but the authorship was soon revealed, and Metastasio left the lawyer's office, studied further, and wrote a series of musical dramas, or melodramas in the true sense, which were set by leading composers and given with great success. In 1730 he settled in Vienna as court poet, and there in 1730-40 wrote his best works, 'Demetrio,' 'Issipile,' 'Demofonte,' 'La Clemenza di Tito,' 'Attilio Regolo.' In the consideration of Metastasio's rank as a poet, his work must be viewed not absolutely, but with regard to its original environment, as done in collaboration with a composer, and rendered by great artists. He wrote, too, for the predominantly vocal system of Italian musical drama; and with this his poetry fell into comparative neglect. His writings have been praised by so good a critic as Symonds for excellent versification, ease of diction, effective simplicity of construction, and frequent imagery of the highest rank. His lyrical verse and criticisms are also of value. The best collected edition of his works is that of 1780-2 (Paris). Consult: Massafia, 'Pietro Metastasio' (1882); also Lee, 'Studies of the 18th Century in Italy' (1880).

Metastasis, (1) in medicine, a change in the seat of a disease, attributed to the translation of morbid matter to a part different from that which it had previously occupied, or to the displacement of the irritation. (2) In botany, a change produced upon a substance designed for the nutriment of a plant, to make its assimilation more easy. Thus, when the starch formed in the leaf of a potato has to be transferred to the tubers as a depot of nutritive material, it is first changed into a soluble substance — glucose.

Metathē'ria, a group-name, not now used, applied to the *Didelphia*, or marsupials, indicating their distinction as a medium subclass between the *Prototheria*, or monotremes, and the *Eutheria*, or higher mammals; but such distinction does not exist in the latter case. See MAR-SUPIALIA.

Metaurus, mē-tā'rūs, or **Metauro**, mā-tow'-rō, Italy, a river in the Marches, which flows

northeast past St. Angelo in Vado, and falls into the Adriatic, southeast of Fano; total course, about 50 miles. It is noted for the victory gained by the Romans under the consuls Claudius Nero and Livius Salinator near its banks over the Carthaginians under Hasdrubal 207 B.C.

Metavoltine. A sulphur-yellow mineral occurring in aggregates of hexagonal scales at Madeni Zakh, Persia. Dichroic. Hardness, 2.5; specific gravity, 2.53; composition: Sulphuric acid, 46.90; sesquioxide of iron, 21.20; protoxide of iron, 2.92; potash, 9.87; soda, 4.65; water, 14.58. Much of the mineral called misy belongs to this species.

Matayer, mē-tā'yēr, Fr. mā-tā-yā. (L. Latin, *medietarius*), a name given in France to the cultivator of a *metairie* or farm who reserves for himself one portion of the produce as the price of his labor and gives the proprietor the other, which represents the rent of the land after deducting what is necessary to keep up the stock. The greater part of the centre and south of France, and almost the whole of Italy, is cultivated by matayers, who are in general upright, economical, and industrious, but ignorant, poor, unenterprising, and not disposed to adopt those systems of agricultural improvement which alone can fully develop the productive powers of the soil. It has, therefore, been keenly debated whether or not the suppression of this class of cultivators would be a national benefit.

Metazo'a, one of the two great sections into which Huxley divides the animal kingdom, the other being the Protozoa. The Metazoa embrace all animals composed of more than a single cell. See ANATOMY, COMPARATIVE.

Metelli, mē-tē'l'i, a Roman family of the gens *Cæcilia*. QUINTUS CÆCILIVS METELLVS MACEDONICVS defeated the Achæans, took Thebes, and invaded Macedonia, etc., and received a triumph 146 B.C. QUINTUS CÆCILIVS METELLVS NUMIDICVS rendered himself illustrious by his successes against Jugurtha, the Numidian king. He took, in this expedition, the celebrated Marius (q.v.) as his lieutenant; was soon recalled to Rome, and accused of extortion and ill-management, but was acquitted of these charges. He celebrated a triumph at Rome 107 B.C. His son, QUINTUS CÆCILIVS METELLVS received the surname of PIUS on account of the love which he displayed for his father when he besought the people to recall him from banishment in 99 B.C. In 83 B.C. he joined Sulla, with whom, three years later, he was united in the consulship. QUINTUS CÆCILIVS METELLVS CRETICVS conquered Crete, and reduced it to a Roman province in 67 B.C. QUINTUS CÆCILIVS METELLVS PIUS SCIPIO, the adopted son of Metellus Pius, in 52 B.C. was colleague in the consulship with Pompey, who had married his daughter Cornelia. Hence he exerted himself to the utmost to destroy the power of Cæsar and strengthen that of his son-in-law. He commanded the centre of Pompey's army at the battle of Pharsalia, and thereafter fleeing to Africa was defeated by Cæsar at Thapsus 46 B.C. He died by his own hand.

Metempsycho'sis. See TRANSMIGRATION.

Meteorites. It is not certain that the distinction commonly made between the smaller meteors, called shooting stars, and meteorites

METEOROLOGICAL SOCIETY—METEOROLOGY

rests upon any essential difference in their physical nature. It has been suggested that while meteorites are solid compact bodies, often of great size and weight, shooting stars may be mere puffs of dust or gas. Both, however, move before encountering the earth with great velocity, in orbits controlled by the gravitation of the sun. The fall of a meteorite is a sporadic occurrence, and no connection has been proved to exist between such falls and the recognized showers of shooting stars, although a small meteorite did fall at Mazapil in Mexico during the display of the Andromedes in 1885. This meteorite, which weighs about ten pounds and is composed of iron alloyed with nickel, is now in the Vienna Museum.

Meteorites are of two classes—the stony meteorites and the iron meteorites. The former are about ten times more numerous than the latter. In the iron meteorites iron usually forms more than 90 per cent of the entire mass, but it is almost invariably alloyed with nickel. In the stony meteorites mineral combinations occur which are peculiar to these bodies, and serve as one of the ear marks by which they may be recognized when they were not seen at the time of their fall.

Other distinguishing marks of meteorites are found in their physical appearance and structure. They are covered with a blackish crust formed by surface melting during their passage through the air. This crust consists mainly of oxide of iron, and is magnetic. Pits and hollows scooped in the surface of a meteorite by the fusing of the less refractory minerals also form a characteristic feature.

When a portion of the surface of an iron meteorite is polished and then etched with acid peculiar markings, called from the name of their discoverer Widmannstätten figures, make their appearance. These are among the most trustworthy criteria of the meteoric origin of suspected masses of native iron.

About one third of the chemical elements known in the laboratory have been found in meteorites. But no new element has ever yet been discovered in them. The following elements occur, in greatly varying quantity, sometimes a mere trace being present:

Iron	Carbon	Oxygen
Nickel	Sulphur	Hydrogen
Cobalt	Phosphorus	Nitrogen
Copper	Silicon	Chlorine
Aluminum	Sodium	Chromium
Tin	Calcium	Titanium
Magnesium	Potassium	Lithium
Argenic	Manganese	Helium

As the true nature of shooting stars was not understood until after the investigation that followed the great shower of 1833, so the true nature of meteorites was recognized only after a remarkable fall of those bodies which occurred at L'Aigle in France about noon on 26 April 1803. Nine years before, in 1794, Chladni, a German physicist, had formulated the theory that meteorites before encountering the earth traveled in independent orbits in space, but his conclusions were not generally accepted until the occurrence at L'Aigle had focused the attention of men of science. On that occasion between 2,000 and 3,000 meteoric stones were scattered over an area about nine miles long by three miles wide. The French astronomer, J. B. Biot, visited L'Aigle, carefully examined

the fallen stones, and collected and discussed the evidence of eye witnesses. Thereafter the old idea that meteors and meteorites were simply atmospheric phenomena was abandoned, and the fact of their extra-terrestrial origin was generally recognized.

Many records of the fall of meteorites have been found in ancient annals, and in modern times, with so many observers continually watching the sky, the number of meteorites seen in flight is annually quite large, although the actual falls observed are always comparatively rare. The number entering the earth's atmosphere in a year has been estimated all the way from 70 up to 3,000 or 4,000. In 1879, on 10 May, there was a shower of meteoric stones in Iowa, the largest mass weighing more than 400 pounds.

Perhaps the most famous meteorite of antiquity was the so-called stone of Egos-Potamos, which fell in Thrace in 466 B.C., and which was described as equaling two millstones in size. Plutarch speaks of it in his life of Lysander. In the Middle Ages the Stone of Eusisheim was very celebrated and became the object of superstitious reverence. It fell at Eusisheim in Alsace on 7 Nov. 1492, when the Emperor Maximilian was at that place. Fragments of this body were taken to Paris and to London, but the principal mass, weighing more than 200 pounds, was suspended in the choir of the church of Eusisheim.

Almost every large meteorological museum contains specimens of meteoric stones and meteoric irons. There are some remarkable examples in the National Museum at Washington. An iron mass, supposed to be of meteoric iron, discovered at Cañon Diablo, Arizona, proved, on examination a few years ago, to contain minute black crystals resembling the diamond, and a meteorite which fell in Russia contained similar black crystals of carbon.

It is yet a disputed question whether the huge masses of iron, weighing many tons, which were brought from Greenland to Stockholm by Baron Nordenskjöld, are really of meteoric origin. The same question attaches to a similar mass which Lieut. Peary transported from Greenland to New York. Other masses of this kind exist in various parts of the world. There is no record of their having fallen from the sky.

GARRETT P. SERVISS,
Author of 'Other Worlds.'

Meteorological Society, The Royal, a scientific body with headquarters in London. Its organization dates from 1850, and in 1866 it was incorporated. All theories and facts pertaining to meteorology are sought for its records, the development of that science in all departments being the object of the association. Besides fellows, the society consists of honorary members, this membership being bestowed upon distinguished persons of other than English nationality. The society publishes the 'Meteorological Record' and the 'Quarterly Journal.'

Meteorology (ἡ μετέωρα+λογία) literally, the science of the things in the air. Meteorology originally included all the phenomena of the air, but many of them are now brought into the realm of astronomy. Meteorology, as the term is understood at the present day, may properly be considered under two heads:—theoretical

METEOROLOGY

meteorology and applied meteorology. Theoretical meteorology will be treated in this article as briefly as is compatible with an intelligent understanding of the subject, and special prominence will be given to applied meteorology in its practical aspects in the United States, particularly in its relations to the manifold and all-important interests of commerce and agriculture.

Theoretical meteorology aims to explain all the various atmospheric phenomena by physical laws, and to reduce them to an accurate and scientific basis. It must then include a discussion of the control of temperatures by the sun and their distribution over the globe, together with the different winds resulting from temperature differences; the moisture of the air in its various forms of invisible vapor, cloud, dew, frost, rain, and snow; and finally, an investigation of storms (or cyclones as they may properly be termed), of varying degrees of intensity, that from time to time pass over the land and the sea; their causes and growth, together with their concomitants of destructive winds and heavy precipitation. The study of these phenomena is the province of the meteorologist and physicist, and a successful solution of the problems that they offer is a goal worthy of man's highest ambition and most earnest endeavor.

History.—From remotest antiquity men's minds have been occupied with the ever-varying changes of the weather. The kalcidoscope of the sky, the seasonal changes, and all the elements that affected his comfort and the necessities of his life, arrested the attention of primitive man. Living for the most part in the open air, with imperfect protection from the inclemency of the weather, he was quick to note all appearances that experience had taught him heralded future weather changes. Thus there naturally and insensibly came into existence a mass of weather proverbs that were eagerly remembered and handed down from generation to generation, so that to-day there is no science that is so thoroughly incorporated in the language and folk-lore of the past. The name science is hardly applicable, however, to meteorology as it then existed, as there was no definite knowledge of its phenomena or of the laws that governed them, prognostics being based solely upon the shifting of the wind, the actions of birds and animals, and other local signs of impending changes.

Naturally, there was but little progress made until there were some suitable means of measuring the fluctuations of the different elements. The invention of the thermometer previous to 1597 and the barometer in 1643 marked a new era, and with the use of these instruments careful and continuous observations were begun, and an impetus given to systematic study and research, that has resulted in a fairly good understanding of the subject to-day.

In the United States.—The history of meteorology in the United States may well be divided into two periods:—the first ending with the inauguration of a national weather service under the control of the government, the second extending from that date to the present. In the second period the history of the weather service is virtually the history of meteorological progress, the conditions being such that the work of investigation could, in the main, be carried

on more successfully under its control than by individuals or by private enterprise. From the time of the first settlement in America records of temperature and precipitation, of various degrees of accuracy and usefulness, were kept in different parts of the country. The first movement toward bringing any sort of order out of the chaos that reigned was by Benj. Franklin (q.v.), who from correspondence with friends, found that some storms moved in a northeasterly direction over Philadelphia, their force being felt in Boston some 12 hours later. Simultaneous observations in Virginia by Thomas Jefferson and Mr. (afterward Bishop) Madison also showed that some definite law governed the progress of storms, with their accompaniments of precipitation and wind.

In England, Hadley had in 1735 published an article promulgating a theory explanatory of the trade-winds, but unfortunately it was comparatively unnoticed for 50 years. An essay by Dalton, also an Englishman, in 1793, marked an epoch in meteorology, as it was the first instance of an attempt to apply the principles of philosophy to an explanation of the phenomena of the atmosphere. From time to time charts of different kinds were constructed and various views were put forth regarding storms, the consensus of opinion being that they were straight line gales. In 1831 Redfield, in America, published his first essay, which contained the important suggestion that storms were great revolving whirlwinds turning counter clock-wise, with a progressive movement toward the northeast. Later he described the warm southerly winds on the easterly side of storms and the cold northerly winds in the western quadrants, maintaining that these winds neither flowed radially inward to the storm centre nor in circles about it, but spirally inward. In 1841, at about the time that the laws of thermo-dynamics were being formulated, Espy showed that ascending air expands and cools its vapor to the point of saturation, thereby causing rainfall; also that descending air is warmed by compression and clouds are thus dissipated; and that the daily heating of the lower strata of the atmosphere causes convectional currents and the formation of cumulus clouds.

A long controversy ensued as to the respective merits of these two theories of storm formation, it being at the present generally conceded that both causes are effective to a certain extent.

Progress and Development.—A new element was introduced into the discussion by Tracy in 1843, namely, the right hand deflecting component of motion in the northern hemisphere, but his idea also escaped recognition for some years. Coffin and Loomis, with Maury and Henry, added to this physical work statistical results that were of great value. To William Ferrell, mathematician and investigator, is, however, due the honor of first contributing an analytical discussion of the motions of the air and reducing the entire subject to definite mathematical expressions. A careful examination of what had been accomplished in a theoretical way, together with a thorough study of such statistics of storms and their movements as were available, convinced many scientific men that it would be possible to forecast the daily weather changes with a fair degree of accuracy. The invention and use of the electric telegraph more than any other one thing had shown the feasibility of

METEOROLOGY

this, for by means of it, it was possible to collect in a few minutes' time the results of synchronous observations at widely separated points. Previous to the outbreak of the Civil War in 1861, Prof. Joseph Henry of the Smithsonian Institution had collected daily observations from some of the principal cities, and indicated the state of the different weather elements on a large map of the United States by means of appropriate symbols. The war interrupted this work, but after the cessation of hostilities there was a strong sentiment in favor of the establishment of a government bureau for the issuing of storm warnings and weather forecasts, representatives of the Smithsonian Institution, the Engineer Corps of the Army, the Navy, the Department of Agriculture, and the American Association for the Advancement of Science being especially active in the agitation that ensued.

The Weather Bureau.—In 1868 Prof. Cleveland Abbe, then director of the Cincinnati Observatory, with the co-operation of the Chamber of Commerce of that city, and the Western Union Telegraph Company, begun issuing a series of bulletins of weather conditions for the benefit of the mariners of the Great Lakes, the first of the kind ever issued in this country. Prof. I. A. Lapham of Milwaukee wished this service extended to include that region also, and in furtherance of his idea sought the assistance of the Chicago Board of Trade and presented a petition to the Chicago Academy of Sciences. One of its members, Hon. H. E. Paine, then a member of Congress, considered the scope of the plan outlined to be too limited, and advised that it be enlarged so as to include the whole country, and then be brought to the attention of Congress. Through his efforts this was done, the result being the passage of a joint resolution 9 Feb. 1870, the provisions of which were:—"That the Secretary of War be, and he hereby is, authorized and required to provide for taking meteorological observations at the military stations in the interior of the continent and at other points in the States and Territories of the United States, and for giving notice on the northern lakes and on the seacoast, by magnetic telegraph and marine signals, of the approach and force of storms." For this purpose the sum of \$20,000 was appropriated. The work of carrying out the provisions of the resolution was entrusted to the signal service of the United States army under Gen. Albert J. Myer, and steps were immediately taken to place the service on a practical working basis. Points at which observations were to be taken were selected, stations equipped, and the members of the corps instructed in the use of the various meteorological instruments, in other duties incidental to the taking and recording of observations, and in carrying on the routine work of the stations.

This was a task beset with many obstacles and difficulties, but Gen. Myer performed it with such remarkable acumen and foresight that to him is due the credit for most of the methods now in vogue in the service, such as synchronous observations, telegraph circuits, weather maps and synopses, and the publication of weekly, monthly and annual reports, the predominant idea throughout being to furnish the public with as reliable information as possible in timely season.

Under the administrations of Gen. Myer and his successors, Gens. W. B. Hazen and A. W.

Greely, the work was gradually extended, more and more interests being served until July 1891, when the service was transferred to the Department of Agriculture, thus creating the United States Weather Bureau by an Act that shows the greatly enlarged scope of its duties. "The chief of the weather bureau shall have charge of forecasting the weather; the issue of storm warnings; the display of weather and flood signals for the benefit of agriculture, commerce, and navigation; the gauging and reporting of rivers; the maintenance and operation of seacoast telegraph lines, and the collection and transmission of marine intelligence for the benefit of commerce and navigation; the reporting of temperature and rainfall conditions for the cotton interests; the display of frost and cold wave signals; the distribution of meteorological information in the interest of agriculture and commerce, and the taking of such meteorological observations as may be necessary to establish and record the climatic conditions of the United States, or as are essential for the proper execution of the foregoing duties." Prof. Mark W. Harrington of the University of Michigan was named by the President as chief of the bureau, serving until July 1895, when he was succeeded by Prof. Willis L. Moore, its present head.

At the central office at Washington the work, for convenience, has been assigned to different divisions under the direct supervision of the chief of the bureau, each having its special line of work. These divisions are described in some detail, as there is thereby given an intelligent understanding, of the duties incumbent upon the bureau. The forecast division receives and charts twice daily telegraphic reports of the prevailing weather conditions throughout the United States, the West Indies, and the southern portions of the British Provinces. Daily forecasts for periods of 24 and 48 hours, based on these charts, are issued for the whole country, together with the weather that trans-Atlantic steamers may expect as far as the Grand Banks. In the case of severe storms when the winds are expected to attain velocities dangerous to marine interests, storm warnings are sent out, not only to the regular stations of the bureau, but also to some 200 special display stations. There are also issued special warnings of cold waves and heavy snows in the winter and of frosts in the spring and fall, especial attention being paid to the needs of truck farmers and the growers of citrus fruits. The province of the River and Flood Service is to obtain information as to precipitation and the amounts of snow and ice on the ground throughout the water-sheds of the principal rivers, whether navigable or not, and the gauging of their various stages. For this purpose, in addition to 48 regular stations, where gauge readings are made, there are 252 special river stations and 74 special rainfall stations. In times of low or average water it gives information as to the future stages of the rivers, thus facilitating commerce, but its chief duty is the issuance of flood warnings in times of threatened danger to life and property. The duties of the Climate and Crop Division have increased from year to year until now the results of its labors are of the greatest benefit to the agricultural interests of the whole country, its bulletins are recognized as an authority, and are eagerly sought for. It maintains a staff of about 3,000 voluntary meteorological observers

METEOROLOGY

serving without pay, who render reports of temperature, precipitation, and other miscellaneous meteorological and climatic data, that are published in the Monthly Weather Review and in the monthly bulletins of the State Sections of the Climate and Crop Service. There is thus being collected an immense amount of data that is available for the discussion of climate in its relations to man from either a hygienic or commercial standpoint. During the season of planting, cultivating, and harvesting, weekly reports of weather conditions and their effects upon various crops and farming operations are received from some 15,000 crop correspondents and embodied in both the national Weekly Crop Bulletin and in 42 Section Bulletins. Special bulletins are also issued for the benefit of the corn, wheat, cotton, sugar, rice, and fruit interests. In addition to the duties mentioned above this division has charge of the distribution of all the forecasts and special warnings issued by the Forecast Division. The Instrument Division is charged with the examination, testing, comparison, installation and maintenance of the instrumental equipment of the bureau. The Division of Meteorological Records has charge of the compilation of meteorological and climatic statistics and their application to the varied needs of individuals, corporations, cities, and courts of law. The Section of Barometry and Aerial Exploration conducts an investigation of the problems of reducing observations of barometric pressure, temperature, and vapor-tension to homogeneous bases in their relations to the circulation of the atmosphere, storm development, and forecasting. It also has charge of the exploration of the upper air by means of the theodolite, the nephoscope, balloons and kites. The Monthly Weather Review contains information as to the weather conditions of each month and a statement of their influence upon crop conditions of the different States, together with special articles on the progress of Meteorology and Climatology. There are also the Publications, Telegraph, and Supplies Divisions, the duties of which are indicated by their respective titles.

Outside of Washington there are now nearly 200 regular meteorological observation stations manned by some 500 observers, printers and messengers, located at points selected for their favorable situation from a meteorological standpoint, and in the larger cities where the greatest number of commercial and marine interests can be served. Regular observations are now taken twice daily, at 8 A.M. and 8 P.M., 75th meridian time, while in the case of any remarkable disturbance in weather conditions special observations are also taken.

Observations.—An observation, technically so-called, consists of reading the different instruments that record the weather elements, recording, and transmitting the same to Washington and other designated stations. The elements observed are the barometric pressure, current, maximum and minimum temperatures, relative humidity, dew-point, amount of precipitation, if any, state of the weather, with kinds and directions of clouds, direction and velocity of the wind, and any unusual phenomena that may be noted, such as exceptionally high winds, thunderstorms, frost and fog. The instruments consist of standard wet, dry, maximum and minimum thermometers, and the mercurial barometer for measuring temperature and pressure, with wind

vane and anemometer for wind direction and velocity. Most stations are also equipped with self-registering instruments that record continuously the fluctuations in pressure and temperature, velocity and direction of the wind, and the number of hours of sunshine. An automatic rain-gauge also registers the times of beginning and ending of precipitation, together with the amounts that occur. The observation having been taken it is embodied in from three to eight words of an ingeniously constructed cipher code and put upon the telegraph circuit. By means of this code five or six words convey the information that would require 10 times that number in ordinary language. It is easily translated and serves the double purpose of eliminating nearly all chances of error in transmission and making a great saving in telegraph tolls. Below is a sample message as sent in the morning:

Boston. *Burnet. Huckabee. Mense. Immense. Curtsy.* Translated the information is as follows: 8 A.M. report; barometer, 30.10 inches; current temperature, 60; precipitation, 0.14 inch; wind, south; weather, cloudy; maximum temperature, 84; velocity of wind, 6 miles per hour; minimum temperature, 54; clouds, "few" cirrus from the northwest.

The telegraph circuits are so arranged that at any station those reports are taken off that are used in chart making and forecasting at that station. These messages take precedence over all others and the system has reached such a degree of perfection that within an hour after the observations are taken they have all been received at Washington and other stations. From this stage all haste is made to translate and chart the reports so that the forecaster will have before him a graphic representation of the conditions that prevail over the whole country, as it is the aim of the bureau to furnish the forecasts and warnings to the public at the earliest possible moment. In addition to the main chart showing the weather conditions at each station, auxiliary charts are also constructed that are of great importance in making the forecasts.

These comprise a pressure-change map, showing 12- and 24-hour changes at each station and departures from the normal; temperature-change map, showing the maximum and minimum temperatures, with changes from the preceding day and from the normal; cloud-map showing the character, amount, and direction of clouds; and a map showing the dry-bulb and wet-bulb temperatures with the differences between the two.

Whereas, forecasts for the whole country were formerly made at Washington, the United States is now divided into seven forecast districts, with centres at Washington, Boston, Chicago, New Orleans, Denver, San Francisco, and Portland, Ore. In charge of each district is a specially-trained official, whose intimate knowledge of meteorology is joined to a long familiarity with practical forecast work, so that with the charts before him he is able to grasp the situation at a glance and as quickly foresee the conditions that are likely to prevail in any section. The successful forecaster must possess those qualifications that would make him pre-eminent in any other vocation. With a thorough knowledge of meteorology and the topography of the country as a foundation, must be combined the essential attributes of alertness, the power to instantly understand the conditions in their minutest details, and the self-confidence that will enable him to make his forecast without hesitancy and unhampered by any wavering

METEOROLOGY

doubts as to its correctness. Experience and long familiarity with the work are also prime essentials, for although six sevenths of our storms move from the Rocky Mountains eastward over fairly well defined tracks, yet their movements are liable to be erratic, and a knowledge of past occurrences under similar conditions is an important factor in determining the phenomena of any particular storm. The forecasts are distributed to the public in a number of ways, that by which the greater number of people is reached probably being the medium of the daily press. The different press associations receive the forecasts as soon as made and immediately furnish them to the papers to whom they render service. They are also telephoned to Chambers of Commerce and other associations where they are posted on bulletin boards. The more important stations of the Bureau are equipped with plants for printing the daily maps and forecast cards, all the typographical and press work being done on the premises. The weather map consists of three parts: (1) a map on which the direction of the wind and the state of the weather for each station are shown by appropriate symbols, while shaded areas show where precipitation has occurred in the past 24 hours. Continuous lines, called isobars, connect points of equal barometric pressure, being drawn for each tenth of an inch, while the dotted lines, or isotherms, drawn for each 10 degrees, connect points of equal temperature. These data are printed on the map by means of the chalk-plate process, so-called; (2) a table showing the current temperature, the change in the past 24 hours, the maximum and minimum temperatures, current wind velocity, and precipitation; the third section comprises the district and local forecasts, a brief synopsis of weather conditions at 8 o'clock, and other miscellaneous data. The forecasts are also printed on franked cards and mailed to post-offices that can be reached the same day, also to business houses, corporations, and other parties, who post them in conspicuous places where the general public has access to them. The forecasts are likewise telegraphed to a large number of distributing centres, from which further distribution is made. This is partly done by means of the telephone, but large numbers of the cards are printed with rubber logotypes and mailed to the surrounding towns. The establishment and extension of the free rural delivery system has brought the forecasts more directly to the rural districts, thus benefiting a class in the community that was not formerly reached. At certain points forecast slips are printed at night and mailed to such free delivery centres as can be reached before the carriers start out on their routes in the morning, so that each family receives a printed forecast for the succeeding 24 hours. As each forecast issued by the Bureau is read by from 1 to 50 persons, it is easily seen that the total number reached is extremely large. This branch of the work, so far as the general public is concerned, is of the utmost importance, although it entails a considerable expense. Results have, however, amply justified its continuance, and the great majority of the people consider that the money annually appropriated for the purpose is well expended.

The practical value of the forecasts depends, of course, on their accuracy, and while there has been a marked improvement in this respect, and

the period covered has been greatly extended during the 33 years that the Bureau has been in existence, still it seems as if the limit in both has been nearly reached, in the light of our present knowledge. At the outset, and for several years thereafter, all forecasts were made and issued at Washington, and, being for comparatively large areas, were necessarily brief and couched in general terms. For example, rain would be predicted for a whole State, when it was very probable that only a portion of the territory would experience the foul weather. The tendency of later years has been to localize the forecasts to a greater extent, and thus render better service.

While the forecast officials of the Bureau are competent to make satisfactory forecasts for any section of the country, still it stands to reason that the man who has been stationed at Chicago, for example, for 10 or 15 years, and who, in addition to his manifold qualifications as a successful forecaster and an expert understanding of the mechanics of storms, has an intimate knowledge of local weather peculiarities, will be more competent, and will issue forecasts for that region that will satisfy local demands in the best possible manner. This localizing of forecasts is one of the great problems that confronts the professional forecaster to-day, and the policy of the Bureau is to encourage better work in this direction.

Thus far forecasts have been deduced from a discussion of the meteorological elements as they obtain at the earth's surface, but there are many adherents of the theory that a better understanding of the laws that govern the formation and passage across the country of cyclones and anti-cyclones can be obtained from a systematic investigation of the conditions that prevail in the upper strata of the atmosphere. Spasmodic attempts to acquire a better knowledge of the phenomena of the higher altitudes have been made by means of kites and balloons, but the data gained have been too fragmentary and disconnected to form a satisfactory basis for scientific discussion. Renewed efforts with more modern appliances will doubtless be made in the near future, and it is possible that these studies will assist in solving the problem of making greatly improved forecasts. However, sporadic observations at a few irregularly distributed points will avail little if anything in the work, simultaneous reports from a number of properly located stations sufficient for the construction of daily synoptic charts being required for the purpose.

Ignorance of the conditions that prevail over the ocean off the Pacific and Atlantic coasts is a serious handicap many times to successful predictions. If the experiments in wireless telegraphy now under way result in instruments that will be of practical use, that system can be utilized to great advantage in collecting information. At present no reports are available from west of the Pacific coast, while messages are received regarding West Indian hurricanes, the most destructive storms that visit the Atlantic coast, from the West Indies alone.

Future Possibilities.—It is quite probable that in the future there will be anchored stations along both coasts, from which meteorological observations at sea will be received by wireless telegraphy. Although the storm warnings now sent out in advance of hurricanes are of

METEORS

inestimable benefit, the advantages accruing from them would be greatly enhanced by such an establishment. The question of seasonal forecasts is also of great moment and is daily brought home to the forecaster, as he is often questioned as to what the coming season may be, whether wet or dry, hot or cold. So far it has been impossible to give any answer based on facts and reason, but the more optimistic of meteorologists are hopeful that ultimately the weather of a season may be foretold with as great a degree of accuracy as that of the coming 24 hours. With wireless telegraphy sufficiently perfected to adapt it to daily use in the transmission of weather messages, a synoptic weather chart embracing the inhabitable globe would be feasible, and the use of it, combined with a knowledge gained from upper air observations, may be the means of enabling the forecaster to overcome the obstacles to long-range forecasts, that is, forecasts for a week, a month, or a season.

Again, as all mundane conditions of heat and cold, life and growth, are attributable to the influence of the sun, it may be possible that a careful consideration of the varying phenomena of that body may show that climatic fluctuations on the earth are directly dependent upon certain changes there. Imbued with this idea, scientists are turning their attention to the recurrence and frequency of sun-spots and solar prominences, hoping by a comparison of data to trace some definite connection between those disturbances of the sun's photosphere and the ever-varying seasons of the earth. The theory has a certain degree of plausibility, and in view of the many remarkable scientific discoveries of the last generation, it is not impossible that the next may find that it is based on facts. Then the mariner can regulate his times of sailing with a certain knowledge of the weather that he may expect to experience during his voyage. Then agriculture will be reduced to a scientific and absolute basis. Droughts and floods may occur, but, forewarned, the husbandman will take every advantage of favorable periods and be prepared to minimize the deleterious effects of adverse conditions. The solution of many questions in astronomy relative to the solar system entailed a vast amount of work distributed over many years, and when it is remembered that meteorology is as yet in its infancy, the world may well feel proud of the degree of success that has so far been attained, in the limited time that the science has been under investigation. Encouraged by the past, it can look hopefully forward to a future even more fruitful of blessings to mankind.

JOHN W. SMITH,
Forecast Official, U. S. Weather Bureau.

Meteors, or Shooting Stars, are those bodies that enter the earth's atmosphere from without and, being intensely heated by impact with the air, are generally consumed before reaching the ground. Meteors vary greatly in size, but the vast majority probably do not exceed a single grain in weight. A few may be seen on any clear night, and the number entering the atmosphere every 24 hours has been estimated by Professor Newton at not less than 15,000,000. The appearance of meteors is graphically described by the phrase "shooting stars." Most of them are no brighter than ordinary stars, but some rival the brightest planets in

luminosity. They seem to leave shining trails behind them, due in the case of small meteors probably to persistence of vision. But the larger ones, resembling brilliant fireballs, leave trails which sometimes remain visible for many minutes. Occasionally large meteors are seen to separate into a number of pieces, or even to burst asunder like exploding shells with loud detonations audible many miles away. Some of the more massive meteoric bodies reach the earth's surface. These are called meteorites and will be found described under a separate heading.

Meteors before encountering the earth are invisible to us, traveling in their own orbits about the sun. The moment they strike the atmosphere their kinetic energy begins to be transformed into heat, and they become visible at an elevation of from 75 to 100 miles, where the air is more rarefied than under the exhausted receiver of an air-pump. This rarefaction of the upper air does not, however, save them from the effects of their impact with the atmospheric molecules. Sir William Thomson (Lord Kelvin) has shown that the effect of the friction of the air upon a meteor is the same as if the latter was enveloped in a blowpipe flame having a temperature of many thousands of degrees, and the degree of temperature thus developed does not depend upon the density of the medium, but is as great in rare as in dense air. In these circumstances the small meteors may be consumed in the fraction of a second. Even if meteors, instead of moving independently about the sun, stood fast in space to be encountered by the earth in its annual flight round the sun, their fate would be similar, for the velocity of the earth in its orbit is more than 19 miles per second, and Professor Newcomb has pointed out that the rise of temperature produced by the impact of our atmosphere with a meteoroid at rest would be nearly 600,000 degrees! But before such a degree of temperature is actually attained the meteor, even though composed of the most solid metal, must be burned up or volatilized with an immense evolution of light and heat. This accounts for the visibility, at the height of 50 to 100 miles, of meteors whose mass may not exceed a single grain.

The height of a bright meteor may be ascertained by comparing observations of its apparent track among the stars made simultaneously from two points on the earth's surface, a number of miles apart. Each observer sees the meteor projected in a different direction, and the fixity of the star-marked background of the sky across which it moves affords the means of determining the angle between the lines of sight of the two observers. This gives the parallax of the meteor, and, the length of the base line between the observers being known, the meteor's distance and elevation can thence be calculated. It is probable that most meteors are entirely consumed by the time they have descended to within 40 or 50 miles of the earth's surface, but some may arrive within five or ten miles of the surface before being dissipated in dust and gas. This statement, of course, takes no account of the massive meteors, or meteorites, which survive the fiery passage and strike the ground.

In addition to the sporadic shooting stars which may be seen on any dark night, darting in various directions across the heavens, these

METEORS

bodies occasionally appear in showers, when the sky seems to be filled with flying sparks of fire all radiating from some fixed point among the constellations. These showers are caused by the earth encountering shoals of meteors traveling in elliptical orbits about the sun.

Scientific study of the orbits of shooting stars began after the occurrence of the most brilliant meteoric shower on record, that of 13 Nov. 1833. This spectacle, which excited the greatest interest among all beholders, and was looked upon with consternation by the ignorant, many of whom thought that the end of the world had come, was witnessed generally throughout North America, which happened to be the part of the earth then facing the meteoric storm. Hundreds of thousands of shooting stars fell in the course of two or three hours. Some observers compared their number to the flakes of a snowstorm, or to the raindrops in a shower. The more observant spectators noticed that all the meteors appeared to radiate from a fixed point in the constellation Leo. Tracing their trails backward it was seen that they came together at that point, like the ribs of an opened umbrella meeting about its central stick. This peculiarity is now known to characterize all meteoric showers, although when the number of meteors is not very great the ribbed appearance produced by the convergence of their trails around the starting point is not so conspicuous. The common centre from which the meteors appear to radiate is called the radiant point, and the determination of its exact location among the stars is of the first importance in ascertaining the actual path of the meteors in space outside the earth. A considerable number of such radiant points are now known, each different swarm of meteors whose orbit happens to intersect the orbit of the earth having its own radiant, the position of which depends upon the situation of the meteoric orbit with reference to the earth.

The explanation of the radiant point depends simply on the laws of perspective. The meteors are traveling in parallel paths in a broad cylindrical column, which may envelop the whole earth. When they become visible by striking the air, the observer, looking in the direction from which they approach, sees those that are coming straight toward him as bright points, which grow rapidly larger and then suddenly disappear when they are consumed. Others which, if they reached the earth, would strike to the right or left, or in front of or behind him, appear to diverge in all directions. The same effect is visible when snowflakes are falling vertically on a calm day. Looking straight upward in the midst of the shower of flakes the observer sees them apparently diverging toward every point of the compass, with the exception of the few that fall straight into his eyes.

Immediately after the great display of 1833 Professor Denison Olmsted of Yale College announced that what had occurred was an encounter by the earth with a vast swarm of meteors moving round the sun. The probability that such an encounter was a recurrent phenomenon suggested itself. It was also observed that there were other, less brilliant, showers at different times of the year, notably the annual display on 10 August, having its radiant point

in the constellation Perseus. George Adolf Erman, a German physicist and mathematician, about 1839 clearly showed how the orbits of the meteoric swarms causing such showers could be determined, but it was not until Prof. Hubert A. Newton of Yale College took up the inquiry in 1864 that the final solution of the problem was begun. Prof. Newton, by a careful discussion of ancient records, demonstrated that ever since the 10th century of our era there had been recurrent showers of meteors in the autumn at an average interval of $33\frac{1}{4}$ years. Sometimes the interval was 34 years and sometimes only 32 years, or less, but the mean was $33\frac{1}{4}$. Upon this basis a return of the shower was predicted for 1866 or 1867.

There had been a gradual change in the date of the showers, which, beginning with 13 October in the year 902, had become 13 November in 1833, but this could be accounted for by planetary attractions shifting the position of the meteors' orbit so that its point of intersection with the orbit of the earth moved forward along the latter about a degree and a half in a century.

It had also been observed that usually there was a considerable display of the meteors a year before or a year after the principal shower. The evident explanation of this was that, instead of being concentrated at one point on their orbit, the meteors were strung along in a column of sufficient length to occupy at least two years in crossing the point of intersection with the path of the earth, so that the latter after meeting them once, could complete its annual circuit and arrive again at the crossing place before the whole column of meteors had passed.

The question remained, what was the length of the orbit of the meteors, or how long a time did they require to make a single journey round the sun and return to their meeting place with the earth? Prof. Newton's computations showed that there were five different orbits, any one of which would be consistent with the observed facts. The test by which the real orbit could be selected from the five possible orbits depended on the perturbing action of the planets, already referred to, and the application of this test would require long and laborious mathematical work.

Before this work had been done the predicted return of the meteors occurred, with a notable shower in November 1866, followed by a second display the next year. On neither occasion was the spectacle equal to that of 1833. Prof. John Couch Adams of Cambridge University, England, now took up the work of computing the planetary perturbations, and he showed that the period of $33\frac{1}{4}$ years must be the true one because it alone satisfied all the conditions of the problem. This period, it will be seen, corresponds exactly with the mean interval between the showers. The orbit is a long ellipse, its inner end being a little nearer the sun than the earth is, its outer end beyond the orbit of Uranus.

The period and orbit of the November meteors having thus been determined, their next return, in 1899 or 1900, was eagerly awaited. Before the time arrived, however, astronomers had begun to foresee the probability of a disappointment. Dr. Johnstone Stoney and Mr. A. M. Downing had calculated the perturbative effect of Jupiter and Saturn upon the swarm, the action of these

METEORS

planets having been particularly effective after 1867, and had pointed out that the result must have been a swerving inward of the meteoric orbit, so that it could no longer intersect the earth's orbit at the old meeting point. The event justified these calculations, for although a considerable number of the meteors were seen in 1899 and 1900, there was no such display as would have occurred had the earth plunged through the main meteoric column.

The orbit of the August meteors or Perseids was also calculated, and this was found to be a still larger ellipse, extending at its most distant point far beyond the orbit of Neptune. In the case of the August meteors the showers occur annually, every time the earth crosses the meteoric orbit. This is due, as Erman showed, to the meteors having become spread entirely around their orbit in a closed ring, so that they are continually passing the point of intersection with the orbit of the earth. A few of the November meteors are seen nearly every year, showing that some of them also have been scattered along the entire circuit of the orbit, although the greater number, in this case, are still collected in a swarm, confined to a relatively small part, one tenth or one fifteenth, of the entire length of the orbit.

The next step was the discovery of an intimate relationship between meteors and comets. In 1867 Giovanni Schiaparelli of Milan showed that the August meteors travel in the same path as that of a bright comet known as Tuttle's, which was discovered in 1862. Shortly after this announcement, and while it was still under discussion, Leverrier published a revised orbit of the November, or Leonid, meteors and almost simultaneously Oppolzer published an orbit of Tempel's comet, which had appeared in 1806. Examination showed that these two orbits were practically identical, thus seconding Schiaparelli's conclusion with regard to the August meteors by furnishing proof that the November meteors also traveled in a comet's track. In 1872 there came a third discovery of the same nature. A comet known as Biela's, which had split in two in 1846, failed to return when due in 1872, but on the night of 27 November of that year, when the earth was passing close to the orbit of the missing comet, a new and brilliant shower of meteors, with its radiant point in Andromeda, made its appearance. These meteors were seen again in 1885 and 1892. Their orbit coincides with that of the lost comet of Biela. The interval between their displays is seven years, but owing to planetary perturbation the date of their appearance in 1892 had fallen back from 27 November to 23 November. They were not seen in 1890.

About a hundred meteoric swarms have now been recognized, most of them furnishing very inconspicuous displays, and at least half a dozen

of these have been shown to travel in the paths of comets. In the table at the bottom of this page are given the elements of the orbits of the three greatest meteoric swarms known to be connected with comets, compared with the elements of the orbits of the comets concerned:

Following is a list of the principal meteor showers with the positions of their radiant points and the dates of their maximum displays. The names are derived from the constellations in which the radiants are situated:

PRINCIPAL METEOR SHOWERS.

NAME	Radiant		Maximum
	Right Ascension	Declension	
Quadrantids	15 H., 19 M.	N. 53°	Jan. 2
Lyrids	17 59	N. 33°	April 20
Eta Aquarids	22 30	S. 2°	May 2
Delta Aquarids	22 38	S. 11°	July 28
Perseids	3 4	N. 57°	Aug. 10
Orionids	6 8	N. 15°	Oct. 19
Leonids	10 0	N. 23°	Nov. 15
Andromedes	1 41	N. 43°	Nov. 23
Seminids	7 12	N. 33°	Dec. 7

These showers occur annually and some of them continue for several nights in succession, the position of the radiant slowly shifting in the meantime with the change in the direction of the earth's motion in its orbit. The Perseids last for no less than five weeks.

Some have supposed that all the known meteoric swarms are composed of the scattered debris of comets which have been broken up by the tide-producing action of the sun, but this is not yet certain. The amount of disintegration suffered by a comet depends upon the number of its trips round the sun, so that the longer it has revolved in an orbit having a short perihelion distance the more widely its particles may be scattered along its track. Since the Leonids still form a somewhat compact swarm, while the Perseids are scattered in a complete ring, it has been assumed that the former are later comers in the solar system (or at least later comers into the near neighborhood of the sun) than the Perseids, and Leverrier tried to fix the date of their first appearance by showing that Tempel's comet, with which the Leonids are related, must have suffered perturbations from a near approach to the planet Uranus in the year 126 A.D., which may have changed its orbit from a very large ellipse, having a perihelion point almost as distant as the orbit of Jupiter, to a smaller ellipse corresponding with the present path pursued by the comet and the November meteors.

METH — METHODIST CHURCH (SOUTH)

Meth. See MEAD.

Methane, Marsh Gas, or Fire-damp, a colorless, odorless, combustible gas, having the chemical formula CH_4 . The name "methane" is derived from the fact that this gas is closely related to "methyl alcohol," the word "methyl" being itself derived from two Greek words which signify "wood spirit." The name "marsh gas" is given in allusion to the fact that methane is formed, in nature, by the decomposition of dead leaves and other vegetable matter, in wet, marshy places. Miners call the gas "fire-damp," from the fact that it occurs in coal mines, where it sometimes forms explosive mixtures with the air, detonating violently when ignited by contact with the naked flame of a lamp. The expression "fire-damp" does not imply the presence of moisture, "damp" being here used in the sense of "vapor." (Compare the German word "Dampf.") To prevent the disastrous explosions of fire-damp in mines, Sir Humphry Davy invented a form of lamp in which the flame is surrounded by a cylinder of wire gauze, the gauze permitting the access of air to the flame, while preventing the passage of flame from the interior of the lamp to the air of the mine. (This action of wire gauze will be readily understood by bringing a piece of such gauze down upon the flame of a candle, and noting that the candle flame does not pass up through it.) The Davy safety lamp is now used only in mines in which the evolution of methane is unusually abundant, free ventilation by means of blowers or fans being quite sufficient to prevent explosions in most cases, especially in the mines of the United States. Methane is formed in large quantities during the destructive distillation of wood (see ALCOHOL), and it also constitutes more than a third of the bulk of illuminating gas, as prepared by the distillation of coal. Pure methane is most conveniently generated by heating sodium acetate ($\text{NaC}_2\text{H}_3\text{O}_2$) with caustic soda (NaOH), methane and sodium carbonate being formed, as indicated by the equation $\text{NaC}_2\text{H}_3\text{O}_2 + \text{NaOH} = \text{Na}_2\text{CO}_3 + \text{CH}_4$. It may also be prepared by passing a mixture of carbon dioxide and the vapor of carbon disulphid over red-hot metallic copper; this reaction being of interest to the chemist, because it illustrates the formation of a hydrocarbon from substances which are admittedly inorganic in nature. Methane is the lightest known gas, with the exception of hydrogen and helium. Its specific gravity, as compared with air at the same temperature and pressure, is about 0.553. It has been liquefied by simultaneous exposure to great cold and to high pressure. When compressed under a pressure of 30 atmospheres, in the presence of water and at a temperature below 32°F ., it forms a crystalline hydrate, which decomposes again into water and methane when the temperature is raised and the pressure removed. Methane is of the greatest importance in theoretical chemistry, since the entire series of fatty compounds (see FATTY COMPOUNDS) may be considered to be derived from it by replacing its hydrogen atoms by atoms of other kinds, or by organic radicals. Indeed, Kekulé regarded all organic compounds as derivatives of methane. Methane burns with a bluish-yellow flame, which is almost non-luminous. It was formerly called "light carburetted hydrogen,"

in distinction from ethylene, which was known as "heavy carburetted hydrogen," or as "bicar-buretted hydrogen." Methane is classed as a paraffin, being the simplest member of the paraffin group.

Methodist Book Concern. See METHODIST EPISCOPAL CHURCH.

Methodist Church (South). The Methodist Episcopal Church (South) became a distinct ecclesiastical organization in 1845. For a period of 60 years, extending from 1784, when the Methodist Episcopal Church was formed, to 1844, when it was divided, the church in the Northern States, and in the Southern States constituted one body. At the organization of the Methodist Episcopal Church, there were 14,988 members; 84 itinerant preachers, besides several hundred local preachers and exhorters, with more than 60 church buildings. Nearly nine tenths of all the members in 1784 were in the Southern States. According to the minutes for 1812 there were 195,357 members and of these 128,299 were south of Mason and Dixon's line (q.v.). John Wesley, the founder of Methodism, declared that the second Methodist society ever organized in the world was formed in Savannah, Ga. The only part of American soil John Wesley ever set foot upon is located in the South. He landed on a small island near Savannah, Ga., Friday, 6 Feb. 1736 and sailed back to England on Thursday, 22 Dec. 1738. During the two years he spent in Georgia he learned through a hard experience the lessons which were afterward embodied in the doctrines of Methodism. The very beginning of Methodism, therefore, was in the South, for the second Society ever organized in the world was formed there and this Society, through the influence of the Moravians, was more distinctly characteristic of such as afterward made up the body of early Methodism than the first, which was formed in Oxford, England.

It is contended by many good authorities that the first Methodist Church ever organized in America, was also formed in the South, in Baltimore, Md. This, however, is disputed by other good authorities who contend that the first Methodist Church in America was organized in New York city. Nine tenths of all the members at the time of the formation of the church into an ecclesiastical body in 1784, were in the South. The term South might therefore be used to define, in a geographical sense, almost the whole of Episcopal Methodism in the beginning of its history. In the South, the movement mainly had its origin, and here it received its setting. Here it has flourished and received into its membership the first settlers, the old families, and here it had maintained its original type, both of life and ecclesiastical organization. It is well known that the question of slavery had something to do with what Rev. Dr. J. M. Buckley, in his 'History of Methodism,' happily terms the "bisection of the Methodist Episcopal Church" in 1844. The real cause, however, of the separation of the Methodist Episcopal Church into two ecclesiastical bodies, was not slavery, but the difference of opinion between the northern and southern sections of the church as to the attitude the church should take toward slavery, as a civil institution. Opposition to the institution of a slavery, at the time the Church was formed, came almost wholly

METHODIST CHURCH (SOUTH)

from the Southern States. On the Conference Minutes for 1784 question 12 reads as follows: "What shall we do with our friends that will buy and sell slaves?" Answer, "If they will buy with no other design than to hold them as slaves and have been previously warned, they should be expelled: and permitted to sell on no consideration." Question 13 is as follows: "What shall we do with our local preachers, who will not emancipate their slaves in the States where the laws admit it?" Answer, "Try those in Virginia another year, and suspend the preachers in Maryland, Delaware, Pennsylvania and New Jersey." Such were the views of Methodist preachers in Conference when nine tenths of them were in the Southern States. The convictions of nine out of every ten of the preachers were shared by the constituted authorities of the Southern States. In 1783, just the year before the organization of the Methodist Episcopal Church, the State of Virginia ceded to the United States all that region then known as the Northwest Territory which was owned by the Original Charter of Virginia, and out of which had been carved the States of Ohio, Indiana, Illinois, and parts of Michigan and Minnesota. This cession was made with the distinct understanding between Virginia and the United States that in the States to be created out of the territory, slavery was not to be allowed. That act had greater influence in bringing about the ultimate abolition of slavery in this country than any act of any other State. As late as in 1789 the State of Georgia passed a law prohibiting the importation of African slaves into that State. At this period of our country's history, the sentiment in favor of slavery was perhaps stronger in the North than in the South. At that time vast sums of money were represented by the shipping industry engaged in bringing slaves to this country, and those ships sailed mainly from New England ports. After the cession of the Northwest Territory by Virginia to the United States, Congress passed an Act creating the Territory of Indiana, and in the act prohibited the introduction of slaves to that Territory. On December 1802, a convention of the people of Indiana Territory was held at Vincennes and there prepared a petition which they adopted and sent to Congress, praying that the Act prohibiting slavery in the Territory be annulled and allowing slaves to be introduced. That convention was presided over by General William Henry Harrison, who signed the petition as President of the Convention and presented it to Congress, in February 1803. In Congress, the petition was referred to a committee, which recognizing the conditions of the contract made with Virginia, reported on it unfavorably, and there the matter ended. When the Constitution of the United States was adopted in 1787, it was provided in Section 9, Article I., that the African slave trade should not be abolished before 1808. That clause in the Constitution delaying the abolition of the traffic in slaves for eleven years, was understood and declared in the South to have been inserted in the interest of the New England ship owners who were engaged in the traffic. It was the custom of the preachers in the Southern States, irrespective of their personal views on the moral phases of the institution of slavery, to follow the advice given by Richard Watson, when speaking to the Wesleyan Methodist preachers in

the West Indies in 1833; he said, "Your only business is to promote the moral and religious improvement of the slaves to whom you may have access, without in the least degree in public or in private interfering with their civil condition."

The convictions of the Southern members were voiced by the General Conference held in 1840 in the following language: "While the Church has encouraged emancipation in those States where the laws permit it, and allowed the freedmen to enjoy freedom, we have refrained, for conscience sake from all intermeddling with the subject in those other States where the laws make it criminal. And such a course we think agreeable to the Scriptures, and indicated by Saint Paul in his First Epistle to the Corinthians, Chapter vii., verses 20-24. And, in their address declared that "at no period of the church had the mere owning of slaves subjected the Master to ecclesiastical excommunication." But, as the time of the General Conference of 1844 drew near, it became clear to the members living in the South, that the traditional refusal of the Church to interfere with existing political and civil relations was becoming a thing of the past. Bishop James O. Andrew had, by marriage and otherwise, become directly connected with slavery. A resolution signed by J. M. Trimble and J. B. Finley, members from Ohio, was introduced and adopted by a large majority, which read as follows:

Whereas the discipline of our Church forbids doing anything calculated to destroy our itinerant general superintendency, and whereas Bishop Andrew has become connected with slavery by marriage and otherwise, and this Act, having drawn after it consequences which in the estimate of the General Conference will greatly embarrass the exercise of his office as an itinerant General Superintendent if not in some places entirely prevent it. Therefore,

Be it resolved, that it is the sense of this General Conference that he desist from the exercise of this office so long as this impediment remains.

The vote on this resolution plainly showed that radical difference on the fundamental theories of Church and of law existed between Northern and Southern members. And it may be truthfully said that the same differences have continued to mark these two bodies since their separation. After the adoption of the resolution, 51 delegates from the Southern States protested against this action of a majority of the General Conference. In their esteem, such a decision placed in jeopardy the General Superintendency of the Church by subjecting any bishop at any time to the will and caprice of a majority of the General Conference not only without law but in defiance to the restraints and provisions of law. A committee of nine was appointed to devise a scheme for the mutual and friendly division of the Church. The report of this Committee is known in history as "The Plan of Separation." According to its provision an emergency was to be met without schism. The Church was to be divided in Christian kindness and the strictest equity, for mutual convenience and prosperity. The part of the Church located in the South was to separate from the part of the Church located in the North, in no sense that the part of the Church located in the North did not separate from the part located in the South. Robert Paine was the chairman of the committee which prepared the plan of separation, and its various provisions were adopted by an almost

METHODIST EPISCOPAL CHURCH

unanimous vote. On 8 June 1844, the last General Conference of the United Church came to a close. The delegates from the Southern States before leaving New York, the seat of the General Conference of 1844, decided to propose the holding of a convention in Louisville, Ky., of delegates from the Southern Conferences.

The convention met in Louisville in May 1845, and there declared that the Southern Conferences represented a distinct connection, under the name of "the Methodist Episcopal Church South." Provision was made for holding the first General Conference of the new organization in Petersburg, Va., in May 1846. At the time of the division in 1844, there were 450,000 members in the Southern Church. In 1860 there were 757,205 members, of whom 207,766 were colored. These figures were reduced after the Civil War, many of the colored people having joined other bodies of colored Methodists. In 1870 the Colored Methodist Episcopal Church in America was established, and nearly all the colored people remaining in the Methodist Episcopal Church (South) up to that time, united with the new organization, so that in 1872 there were in the Methodist Episcopal Church (South) 654,159 members of whom there were only 3,232 colored persons.

The Methodist Episcopal Church (South) has increased rapidly in membership since 1872. According to the last general minutes of the Church the statistics in 1903 were as follows: total number of members and preachers, 1,535,032; traveling preachers, 6,469; local preachers, 4,816; infants baptized, 28,472; adults baptized, 55,848; Epworth Leagues, 5,346; Epworth League members, 116,579; Sunday Schools, 14,423; Sunday School teachers, 104,650; Sunday School scholars, 934,110; church buildings, 14,872; value, \$25,203,303; parsonages, 4,092; value, \$4,790,188; annual conferences, 47; amount paid for missions foreign and domestic, \$477,394; schools and colleges, 132; value endowment, \$2,757,197; value of property, \$5,877,000.

REV. JAMES W. LEE,

Saint John's Church, Saint Louis, Mo.

Methodist Episcopal Church, The. It is not a paradox to say that American Methodism originated in England; for John Wesley, a clergyman of the Church of England and an alumnus of Oxford University, is acknowledged to be the founder of that form of Methodism which was permanently established on this continent. His doctrines were those of the Church of England, but a new experience, attained 24 May 1738, caused him ever afterward to place special emphasis on certain of them. In the latter part of 1739 he organized "The United Society" consisting of those like-minded with himself. From this dates Wesleyan Methodism, of which American Methodism is directly descended. Twenty-eight years afterward there were in Great Britain and Ireland about 26,000 members enrolled.

So far as is certainly known not a single Wesleyan Methodist appeared in the territory now included in the United States of America until 10 Aug. 1760, when a company of emigrants from Ireland arrived in New York. Among them were several followers of John Wesley; one of these, Philip Embury, had served as a Wesleyan local preacher. Five years later another vessel brought over five families, most

of whom were related to Embury; these also settled in New York. Nothing is known of them as Methodists till the latter part of 1766, when Mrs. Barbara Heck manifested genuine zeal by arousing in Embury, her cousin, the conviction that they were in danger of falling away, and inducing him without an hour's delay to open preaching services in his own house. There and then to a congregation of five he preached the first Methodist sermon in America. In 1767 the society was reinforced by Captain Thomas Webb, of the British Army, who had been authorized by Wesley to preach. His oratorical powers, zeal, rank and private means, made him a most valuable accession. With his aid Wesley Chapel (John Street, N. Y.), the first Methodist church in America, was completed, and was formally opened 30 Oct. 1768.

Meanwhile a work of which the Methodists of New York knew nothing was progressing in Maryland. Robert Strawbridge, with several other Irish immigrants, had settled in Frederick County. He preached the first sermon, formed the first society, and built the first preaching house for Methodism in Maryland. His society soon contributed four preachers to the general movement. By some writers it is stoutly maintained that Strawbridge began to preach and had built his meeting-house before Embury preached his first sermon. Testimony is adduced on both sides of the question of priority, but the standard historians of Methodism are almost a unit in the conclusion that while there was little difference in time, Embury's claim as the first Methodist preacher is established beyond reasonable doubt.

In the 26th English annual conference, sitting at Leeds in August 1769, Wesley said, "We have a pressing call from our brethren in New York, who have built a preaching house, to come over and help them." Joseph Pilmoor and Richard Boardman were commissioned to America, and a subscription taken on the spot furnished £50 to assist in paying the debt on the preaching house in New York, and £20 for their passage. In 1771 the number of members reported to Wesley's Conference for the "great Continent of North America" was 316. Wesley asked for volunteers to send to the United States; five responded, but two only, Francis Asbury and Richard Wright, could be spared. The former on arriving immediately manifested great zeal and fidelity in the administration of discipline, and the year after his arrival he received a communication from Wesley placing him in charge of all the preachers, including Boardman and Pilmoor. In 1773 Wesley sent over Thomas Rankin, one of the chief men of the Wesleyan movement, a Scotchman, a man of iron will and inexorable conscience. He brought a commission as superintendent of the American societies, superseding Asbury, who was younger and of much less experience.

The first American Conference was held in the city of Philadelphia, beginning on 14 July 1773, and continuing in session three days. It opened with nine preachers, and on the second day Francis Asbury arrived. Every preacher was a native of Europe. One thousand and sixty members were reported. The Conference unanimously adopted the foundation principles of American Methodism. The authority of Mr. Wesley and the British Conference was to ex-

METHODIST EPISCOPAL CHURCH

tend to the preachers and people in America, as well as in Great Britain and Ireland; and the Doctrine and Discipline of the Methodists as contained in the English Minutes, to be the sole rule of their conduct and the standard of their preaching. The Conference resolved that if any preachers should deviate from the Minutes it could have no fellowship with them until they changed their conduct. It unanimously agreed that every one who acted in connection with Mr. Wesley, in America, was "strictly to avoid administering the ordinances of baptism and the Lord's Supper." Those "among whom they labored were to be earnestly exhorted to attend church and to receive the ordinances there." Similar conferences have been held annually, and the institution is an integral part of the constitutional principles and machinery of the church.

The Conference of 1776 assembled in Baltimore on the 21st of May under great tribulation. The membership had increased 50 per cent during the year, but Asbury was ill and unable to attend, and the country was full of wars and rumors of wars. The Conference appointed 26 July as a day of fasting and prayer. Before that time arrived the Declaration of Independence, which affected profoundly every law and interest of the colonies, and was destined to influence Methodism to an extent not yet fully measured, had been submitted to the judgment and sympathy of the world. Notwithstanding the agitation of the public mind, the Methodists devoted their energies chiefly to increase and consolidation; so that the returns to the Conference of 1777 showed large gains in membership and preaching staff. The English preachers, perceiving that the war would last for an indefinite period, determined to return to their own country, and within a few months all of them did so except Francis Asbury; and on account of the unpopularity of the English preachers he was forced into retirement.

Controversies arose because the people were without the sacraments. They were generally destitute of the Lord's Supper and there was no one to baptize the children. Most of the clergy of the Church of England had left the country, and a large proportion of the few that remained were indifferent to the needs of their parishes or hostile to the Methodists. In the emergency a large conference, consisting principally of Southern members, appointed a committee to ordain themselves; this being done, they set apart other ministers for the same purpose that they might administer the ordinances to those whom they had taught the way of salvation. Most of the preachers and members in the South sympathized with them; but those north of Virginia were opposed to the action. When disruption seemed inevitable, a compromise was reached and the administration of the ordinances was suspended pending direction from Wesley, who advised them to endure deprivation till the path of duty became too plain to be mistaken.

Correspondence with England having ceased or become uncertain, and General Assistant Rankin having left the country, the conference unanimously chose Francis Asbury to "act according to Wesley's original appointment and preside over the American Conference and the whole work." At the close of the war the entire

country began to call for Methodist preachers. At the Conference early in 1784 the wide distribution of the work was recognized, and an increase of 1,248 members shown. Wesley having slowly reached the conclusion that to save the societies in America from disintegration they should be organized under an Episcopal form of government, proposed to Thomas Coke, an alumnus of Oxford, a Doctor of Laws and a presbyter of the Church of England, a man of considerable fortune, who had allied himself with him and his work about four years previously, to accept ordination as a superintendent and to proceed in that character to the United States.

After considering the matter for about two months Dr. Coke acceded to the proposal, and at Bristol, England, assisted by Coke and the Rev. James Creighton, a minister of the Church of England, Wesley ordained Richard Whatcoat and Thomas Vasey presbyters for America. After this was done Wesley ordained Coke a superintendent, giving him a certificate of which the original, in Wesley's hand-writing, is extant. He also prepared a letter explaining the grounds of this action, to be circulated among the societies on Coke's arrival in America. The grounds he assigned were that "the English government had now no authority over them, either civil or ecclesiastical"; that he was convinced "many years ago that bishops and presbyters are of the same order and consequently have the same right to ordain"; that "for many years he had been importuned to exercise this right, but he had refused for peace sake, and also because he was determined as little as possible to violate the established order of the national church to which he belonged." He had vainly tried "to induce the bishop of London to ordain one." "There were no bishops in North America that had a legal jurisdiction; for hundreds of miles together there were none either to baptize or administer the Lord's Supper"; therefore he had "appointed Thomas Coke and Francis Asbury to be joint superintendents in North America." Until he was 42 years old Wesley believed in Diocesan Episcopacy as a distinct order, in direct succession from the Apostles. He attributed the radical change in his views to his reading Lord King's 'Account of the Primitive Church' and Stillingfleet's 'Irenicon.' The former he read 20 Jan. 1746, records the fact in his journal for that date, and says, "In spite of the vehement prejudice of my education I was ready to believe that this was a fair and impartial draught; if so, it would follow that bishops and presbyters are (essentially) of one order." This entry was made 38 years before Wesley "laid hands" on Coke.

Coke and the two elders were enthusiastically received in the United States; a special conference of the preachers was called which, at a meeting begun on Friday, 24 Dec. 1784 (known as the Christmas Conference), established and named the Methodist Episcopal Church, recognized the right and competency of Coke to confer orders, and unanimously elected him and Francis Asbury to be joint superintendents. The powers of bishops, presbyters and elders were specified and certain rules formed. The doctrines of the church were settled as comprehended in certain sermons of Wesley's, the Minutes, his Notes on the New

METHODIST EPISCOPAL CHURCH

Testament, and 24 of the 39 Articles of the Church of England. Those omitted were the 3d, the 8th, the 13th, 15th, 17th, 18th, 20th, 21st, 23d, 26th, 29th, 33d, 35th, 36th, and 37th. In those sent over by Wesley and adopted there are various alterations; some merely in phraseology, others radically changing the meaning. To the 24 articles the Conference added a 25th, recognizing the United States as "a sovereign and independent nation." Wesley also sent over the Sunday Service of the Church of England modified upon the same principles upon which he altered the articles. The systematizing and energizing effects of this settlement were seen at once. The first regular General Conference was held in 1792. During its sessions James O'Kelly, a very popular district elder, fruitlessly endeavored to limit the episcopal power of appointments, by giving dissatisfied preachers the right of appeal. Disappointed he withdrew, and led away several preachers and many members. At the General Conference of 1804, the power of the bishops in making appointments was limited by a resolution prohibiting the appointment of pastors for more than two consecutive years in any one circuit or station. Theoretically all traveling ministers who had served for four calendar years were members of the General Conference; but in practice few came from distant points. Hence unendurable dissatisfaction arose because of the preponderating number and denominating votes of those living near the seat of the Conference. Representative government was introduced by the General Conference of 1808, which provided for a delegated General Conference to assemble on the first day of May 1812. It was composed of one delegate for each five members, two thirds of all the representatives were requisite to make a quorum, and if present one of the general superintendents must preside; otherwise the Conference had power to elect a president, pro tempore. To the Conference thus constituted was given "full power to make rules and regulations" for the Church, subject to the following exceptions: It cannot touch "revoke, alter or change" the doctrinal standards, nor change the ratio of representation; nor "do away with Episcopacy or destroy the plan of our Itinerant General Superintendency"; nor modify the general rules, nor "do away" with the rights of ministers and members to trial and appeal; nor devote the profits of the Book Concern or the dividends from the Chartered Fund to any other cause than to the support of the ministry, their wives, widows and orphans. The constitution provided for its alteration by separate but concurring votes of the Annual Conferences and two thirds of the members of the General Conference.

Previous to the General Conference of 1812, the body known by that name was absolute. Under the new constitution the first great struggle was for recognition of the laity in the government of the church. With this was connected criticisms of the Episcopacy and its powers. In the end a large number of the lay, and some of the clerical, leaders of the movement were expelled, and they, with others who voluntarily withdrew, formed the Methodist Protestant Church in 1830.

A formidable attempt—supported by many of the most influential men of the denomination—was made to take away from the bishops the

right of appointing the Presiding Elders of the districts into which for executive purposes the Annual Conferences are divided. This struggle agitated the church for 10 years and was hotly contested in two General Conferences. A modification of the plan prevailed in the General Conference by a small majority. The Senior Bishop, McKendree, pronounced it unconstitutional, and agitated the Annual Conferences almost to the verge of disruption. In the end the project was defeated. It reappeared at intervals, making its final effort in 1876, when it was overwhelmingly rejected. A controversy more agitating, persistent and disastrous grew out of the slavery question. During the entire history of American Methodism it had been a burning question, becoming more and more acute at each successive General Conference. The real crisis of the Methodist Episcopal Church occurred in 1844. Bishop James O. Andrew, a native of the South and a man of unbounded personal popularity, became, through marriage, complicated with slavery. The anti-slavery sentiment of the North and parts of the West would not brook this in a bishop, and in the General Conference of 1844 there were introduced resolutions of protest and censure, expressed or implied, of different degrees of strength and offensiveness to the Southern members in the General Conference. During the discussion radically divergent views of the Constitutional rights of bishops came into view. After a debate which attracted the attention of the whole country, the following was passed:

"That it is the sense of this General Conference that he (Bishop Andrew) desist from the exercise of this office (that of general superintendent) so long as this impediment (his connection with slavery) remains."

Nearly all the votes for the resolution were from the free, and nearly all against it were from the slave-holding, States. The result was that the Southern Conferences established a distinct religious Communion under the name of the "Methodist Episcopal Church, South" (q.v.). (The two denominations have long been on increasingly friendly terms, and are now through commissions engaged in perfecting a hymnal and an order of service to be used in common.)

In 1866 the sense of the Church was taken on the question of Lay Representation, and the decision was in the negative, both lay and clerical. In 1868 and during the four years following, the same proposition was tried again, and the constitution was amended so as to admit a restricted number of laymen into the General Conference of 1872; after several unsuccessful attempts, the number of lay and clerical delegates was constitutionally made equal, the change taking effect in the General Conference of 1900. In 1887-8 five women were elected lay delegates to the ensuing General Conference. Their eligibility was challenged on the ground that the constitution contemplated male members only. The challenge was sustained and a change in the constitution submitted to the Conferences. It did not prevail; subsequent Conferences were agitated upon the subject, women were seated and challenged, the question was not brought to an issue, and two more attempts to change the constitution so as to render them unquestionably eligible were unsuccessful. In 1900, the constitution as a whole

METHODIST EPISCOPAL CHURCH

was revised; the word "laymen" removed from the law and its place filled with the phrase "lay members," which now makes members otherwise qualified and duly elected eligible to seats in the General Conference without distinction of sex. In 1864 the time limit upon the appointment of pastors was lengthened to three years; in 1885 to five years; and in 1900 it was entirely removed.

The Church is divided into 124 Annual Conferences, 18 of which are in foreign countries. Beside these are 19 Mission Conferences, of which 7 are foreign. The Bishops preside in these Conferences. In its 120 years of organization it has had 46 Bishops, of whom 16 are living. There are also 3 Missionary Bishops, 2 in India and 1 in Africa.

The oldest important subordinate organization of the Church is the Methodist Book Concern, founded in 1789. Originally designed to print and publish Methodist and general religious literature, its profits, if any should accrue, to be devoted to the support of the ministry, its function has been greatly enlarged till its capital in the Eastern and Western Houses approximates \$3,000,000. This institution publishes a series of denominational weekly journals whose generic name is 'Christian Advocate,' the oldest of which is 'The Christian Advocate' in New York. It also publishes the 'Methodist Review' (bi-monthly) and 'The Epworth Herald' (weekly). It issues periodicals in various languages, books upon all subjects, and in fact does a general book business. There are also papers published in the interest of the churches by local associations, the best known of which are 'Zion's Herald' of Boston, Mass., and the 'Michigan Christian Advocate' of Detroit.

Next to the Book Concern in age is the Missionary Society. Since this institution was founded, 80 years ago, it has disbursed upward of \$35,000,000, rather more than two fifths of which has been spent in this country, the rest in foreign countries. Its missions are in Africa, China, India, Japan, Korea, Malaysia (including the Philippines), South America, Mexico, Germany, Sweden, Norway, Denmark, Finland, Switzerland, Italy and Bulgaria. Besides the "parent" Society are the Woman's Foreign Missionary Society, which collected and expended in 1902 \$478,236, and the Woman's Home Missionary Society, which in 1902 received and disbursed \$341,243. The Church Extension Society in the last 40 years has aided 12,356 churches. It distributes in donations \$200,000 per annum, and has a loan fund, the working value of which amounts to nearly \$3,000,000.

The educational work of the Church in this country includes 52 Colleges, Theological Seminaries and Universities, besides a large number of Academies. Of these the first organized is Wesleyan University, and the largest (in property and students) are the Northwestern University, of Evanston-Chicago, the Ohio Wesleyan University at Delaware, Ohio, and in the East, Boston University and Syracuse University. The Woman's College of Baltimore marks the highest point reached by the Church in the education of women. The American University in Washington is not yet opened. The Church sustains a board of education which aids students by loans and gifts, besides performing other

important functions. The Freedman's Aid and Southern Education Society sustains 40 institutions in the South, and with them more than 200,000 students have been connected. Increasing attention is paid to industrial education. The latest enterprises of the Church are the Epworth League (the denominational young people's society), with nearly 1,800,000 members, and the incorporation of Deaconesses with church work. This movement, though of quite recent origin, employs 685 Deaconesses, 739 Probationers, and has accumulated net assets of over \$2,000,000. It has been less than 20 years since the attention of the Church was drawn toward the erection and management of hospitals; already it has 25 in operation and several more in process of erection. Of these the Methodist Episcopal (Seney) Hospital of Brooklyn, and the Methodist Episcopal (Stewart) Hospital of Philadelphia are the largest and oldest.

No tax of any kind is levied upon individual members of the Church; their contributions are voluntary; no charge is made for the administration of baptism or the burial of the dead. Yet it is a conservative estimate that in the three years preceding the present the Church has given \$100,000,000 to its work. And during the past 20 years, for the current support of local churches, the support and endowment of denominational schools, colleges and theological seminaries, the regular collections and special gifts for missions and the other organizations previously mentioned, The American Bible Society, Homes for the Aged, Hospitals, Orphan Asylums, Saint Christopher's Home and similar institutions, including the recent \$20,000,000 thank offerings (but not duplicating the same, nor including much untabulated gifts in local churches), the denomination has given upward of \$410,000,000. The number of communicants reported in 1882 was 1,748,021; in 1902, 3,000,295.

The African Methodist Episcopal Church was organized in 1816 and in 1902 reported 728,354 members (estimated). The African Methodist Episcopal Zion Church was formally organized in 1820 and in 1902 reported 542,422 members. These bodies were founded by members of the Methodist Episcopal Church. The Colored Methodist Episcopal Church was formed of members of the Methodist Episcopal Church, South, set apart after the Civil War. After 1865 the Methodist Episcopal Church spread rapidly among the Southern negroes, and it enrolls among its members more than 200,000 of African descent. The Wesleyan Methodist Connection of America was formed in 1843 by ministers and members of the Methodist Episcopal Church who regarded the mother church as not sufficiently anti-slavery, and also disapproved some features of its government. Beginning with 6,000 members it reported in 1902 17,000 members. The Free Methodists date from 1860. It grew out of the disciplining of certain members and ministers for contumacy. The root difficulty related to "secret societies" and certain doctrines and experiences which they advocated so as to create dissension in the churches. They claimed to be persecuted "for righteousness sake." In 1902 they reported 28,038 members.

DR. JAMES M. BUCKLEY,
Editor 'The Christian Advocate.'

METHODIST NEW CONNECTION — METHYL

Methodist New Connection. See NEW CONNECTION METHODISTS.

Methodius, mē-thō'dī-ūs. See CYRILLUS AND METHODIUS.

Methuen, mē-thū'ēn, Paul Sanford, BARON, English general: b. Corsham Court, Wiltshire, 1 Sept. 1845. He is descended from Sir Paul Methuen who effected the treaty, named after him, between England and Portugal in 1703. He studied at Eton; entered the Scots Guards in 1864; saw special service on the Gold Coast in 1873; received a medal for bravery in the Ashanti campaign in 1874; became attaché in Berlin (1877), assistant quartermaster-general Home District (1881), and quartermaster-general in Egyptian War (1882); won a C. M. G. in Bechuanaland (1885); was in command of the Home District from 1892 to 1897; and commanded one of Buller's divisions in the unsuccessful attempt at the beginning of the South African war to relieve Kimberley. At Magersfontein he was terribly beaten. With Lord Roberts he marched on Pretoria in May 1901. In March 1902 he was captured between Vryburg and Lichtenburg, but immediately released. His South African record formed a strange contrast to his early military career.

Methuen, Mass., town, in Essex County; on the Spicket River, and on the Boston & Maine Railroad; about two miles north of Lawrence. It was settled in 1641 but was a part of Haverhill until 1725 when it became the town of Methuen. The government is administered, as in its early days, by town meetings. It has a number of manufacturing establishments, chief of which are cotton and woolen factories, bell foundry, organ factory, knitting mills, hat factory, worsted goods and yarn factories, and basket factories. It has good schools and the Nevins Memorial Library. Pop. (1890) 4,814; (1900) 7,512.

Methuen Treaty, a commercial treaty between Great Britain and Portugal signed in 1703 and annulled in 1835, having to do with the tariff on wines and wool. It was negotiated by Paul Methuen, the British ambassador to Portugal.

Methuselah, mē-thū'sē-la ("man with a dart?"), Hebrew patriarch. He is remarkable as the oldest man mentioned in the Bible, his age being stated in Gen. v. 27 as 969 years. According to Hebrew chronology, and to that of the Samaritan version (which, however, reduces his age to 720 years), he died in the year of the Flood; but the Septuagint calculation makes him die six years earlier.

Methyl and its Derivatives, in chemistry; this name is given to the hypothetical radical CH_3 , supposed to exist in methylic alcohol, and in very many other carbon compounds. Methyl forms the first of the series of alcohol radicals, the general formula of which is $\text{C}_n\text{H}_{2n+1}$. In the year 1848 Frankland and Kolbe, by the action of potassium on ethyl cyanide, obtained a gas the composition of which agreed with the formula C_2H_6 ; now such a body may be regarded either as (1) ethyl hydride $\text{C}_2\text{H}_5\text{H}$, or (2) as two atoms of methyl linked together to form one molecule.

For a considerable time the new substance was supposed to be free methyl, that is—

and to be isomeric, but not identical with ethyl hydride $\text{C}_2\text{H}_5\text{H}$.

According to the generally received views concerning atomicity (see CHEMISTRY) such a body as CH_3 could not exist in the free state; it was therefore in keeping with chemical theory to believe that in the moment of its liberation the atoms of this substance should combine together in pairs to form the stable molecule—

A few years later Frankland succeeded in preparing the same body by the action of zinc on methyl iodide, $\text{Zn} + 2\text{CH}_3\text{I} = \text{ZnI}_2 + 2\text{CH}_3$. Frankland compared the action of chlorine on this supposed 2CH_3 with the action of the same gas on the so-called ethyl hydride ($\text{C}_2\text{H}_5\text{H}$), and concluded that the two bodies were not identical. Schorlemmer has, however, studied this action of chlorine more carefully, and he finds that the resultant substances are the same in each case. The reactions which take place between equal volumes of chlorine and of the gas C_2H_6 may be thus formulated:

The first reaction is the principal one; small quantities of the body $\text{C}_2\text{H}_4\text{Cl}_2$ (dichloro-ethane) are, however, always formed. The identity of the two substances formerly known as free methyl and ethyl hydride has been thus proved, so that we now know only of one body having the formula C_2H_6 , to this substance the name of ethane is given, it forms the second hydrocarbon in the marsh-gas, or $\text{C}_n\text{H}_{2n+2}$ series. From these considerations it is evident that the radical methyl is only known in combination with other bodies. By the action of chlorine on certain methyl compounds the body CH_3Cl is obtained, from which again the bodies CH_2Cl_2 , CHCl_3 , and CCl_4 may be produced. The oxide of methyl (CH_3)₂O, or methylic ether, is produced by the action of sulphuric acid upon wood spirit; this ether may be taken as typical of a large series, in which one of the groups CH_3 is replaced by another radical (either alcoholic or acid). The hydroxyl derivative of methyl, or methylic alcohol, CH_3OH , is prepared in many ways. The most generally employed method consists in rectifying the product obtained by the dry distillation of wood (hence the common name for this alcohol—wood spirit); but in order to obtain perfectly pure methylic alcohol it is necessary to prepare a methylic ether, generally methyl oxalic ether, decompose this by distillation with water, and dehydrate the alcohol so obtained by means of quicklime. Methylic alcohol is a colorless mobile liquid, having a specific gravity of .8142 at 0°; its boiling point lies about 60° C. The presence of a certain amount of methylic alcohol in ordinary or ethylic alcohol does not interfere with the use of the latter substance in many chemical operations. Such a mixture is known in commerce under the name of *methyiated spirit*. Methylic alcohol yields by oxidation formic acid ($\text{C}_2\text{H}_3\text{O}_2$), thus $\text{CH}_3\text{O} + \text{O}_2 = \text{CH}_2\text{O}_2 + \text{H}_2\text{O}$.

METHYL ALCOHOL—METRIC SYSTEM

Another important series of methyl derivatives consists of substances known as *methylamines*; these are generally regarded as ammonia in which one, two, or three hydrogen atoms are replaced by one, two, or three atoms of the radicle CH_3 . Thus we know of the substances $\text{N H}_2\text{CH}_3$, $\text{N H}(\text{CH}_3)_2$, and $\text{N}(\text{CH}_3)_3$. Further, as we know of such bodies as ammonium iodide and chloride, so we are acquainted with the corresponding methyl-ammonium salts $\text{N}(\text{CH}_3)_4\text{I}$, etc. The group C H_2 may also be introduced into many of the natural alkaloids (see *STRYCHNINE*), giving rise to methyl derivatives of these bases.

Methyl Alcohol. See *ALCOHOL*, and *METHYL*.

Methylated Spirit, alcohol or spirit of wine containing 10 per cent of wood naphtha, which contains a large proportion of methylic alcohol (see *METHYL*). It is much used in the arts as a solvent, for preserving specimens, in the manufacture of varnishes, and for burning in spirit and other lamps.

Methylene, Bichloride of, an organic compound of great value as an anæsthetic. It is a colorless fluid having an odor like that of chloroform, and is pleasant to inhale.

Methylene Blue, an aniline dye; a bluish crystalline powder having a bronze-like lustre. It is used in medicine, and in malaria is given as a substitute for quinine. See *DYES*.

Metis, *mēt'is*, in ancient mythology, the first wife of Jupiter, whom he was said to have devoured, after which Minerva (q.v.) was formed within his head.

Metlahkatla, *mēt-lā-kā'tlā*, or **Metlahkatlah**, the native name of the oldest and most successful mission among the Indians of British Columbia, founded in 1857, by William Duncan, an English missionary, who developed a model community from a tribe of the lowest cannibals. In 1887, having by petition to the United States government received the grant in perpetuity of Annette Island, Alaska, the community removed to that place, where it became very prosperous under the name of New Metlahkatla. In 1898, a bill infringing on the rights of these settlers was introduced in Congress by prospectors wishing to exploit the mineral resources of the island; but the measure was defeated.

Meton, *mēt'ōn*, or **Meto**, Athenian mathematician who flourished 432 B.C. In the first year of the 87th Olympiad he observed the solstice at Athens, and in conjunction with Euctemon published his cycle of 19 years known as the Metonic cycle (q.v.).

Metonic Cycle, a period of 19 solar years, after which the new and full moon fall on the same days of the year as they did 19 years before. This cycle was the invention of Meton, a celebrated Athenian mathematician, 432 B.C. The Metonic cycle contained 6,940 days, which exceeds the true length of 19 solar years by 9½ hours nearly. On the other hand, it exceeds the length of 235 lunations, or synodic revolutions of the moon, by 7½ hours only. In the ecclesiastical calendar the number of the year in the cycle is called the golden number. The cycle is supposed to commence with the year in which the new moon falls on the 1st of January.

Metope, *mēt'ō-pē* (Greek, *meta*, between and *opē*, a hole), in architecture, the interval

or square space between the triglyphs in the Doric frieze. The ancients were in the habit of ornamenting these parts with carved works, or with paintings.

Metre, *mē'tēr*, the unit of length in France, = 39.37079 English inches. The metre was intended to be the ten-millionth part of the quadrant of a meridian of the earth. The *centimetre*, the one-hundredth part of a metre, possesses more advantages in physics as a unit of length; it is also found very convenient for many purposes for which the English yard is employed. See *WEIGHTS AND MEASURES*.

In music, the equalization of time in the division of a composition. The measure (q.v.) is the smallest element in metre; two measures make a *section*, two sections make a *phrase*, and two phrases make a *period*. See *MUSIC*.

In poetry, a name applied to measured or rhythmic verse; where versification depends not only on the number of feet in a line, but also on the length of the syllable or syllables in each foot. See *POETRY*.

Metric System, The International. In early times each locality and industry had its own system of weights and measures which crudely served local needs and primitive conditions. With increasing intercourse between communities, this diversity of units and standards proved confusing and intolerable, and the demand for a simple universal system grew steadily to a climax in the closing years of the 18th century. The metric system of weights and measures was the fruit of decades of research, agitation, and indefatigable labor toward this end.

As early as 1670, Abbé Gabriel Mouton proposed as the unit for length an arc of one minute of the earth's circumference. Decimal subdivisions and multiples of this unit and an excellent Latin terminology were also suggested. Fifty years later, J. Cassini again suggested this unit. Christopher Wren, the English architect of Saint Paul's, urged as a unit the length of a pendulum beating half seconds. The length of a seconds-beating pendulum was proposed successively by Picard (1671), Huygens (1673), La Condamine (1747), and by Prieur, Miller, Jefferson, and Talleyrand in 1790. About 1783 James Watt, the inventor of the steam-engine, proposed a new decimal system with a simple inter-relation between the units of length, area, volume, and weight, a definite volume of water being taken as the unit of mass. In 1782, Gouverneur Morris, of Philadelphia, urged the use of the decimal ratio in the new monetary system. This was adopted and undoubtedly impressed the French with the great convenience of using the same universal system in daily trade which is used to express all abstract values. Influenced by the report of Morris, Thomas Jefferson, then secretary of state, on 20 May 1790 published a report outlining a decimal system of weights and measures.

Before the French National Assembly took the action in 1790 which culminated in the establishments of the metric system, the important elements and principles of a universal system of weights and measures had already been formulated: (1) The Arabic numerals with their decimal notation, already in use throughout Europe long before Roman numerals were discarded in English accounting; (2) the deci-

METRIC SYSTEM

mal ratio, whose origin antedates history, applied by the United States to its coinage upon recommendation of Gouverneur Morris; (3) a natural base for the unit of length urged by Christopher Wren; (4) an aliquot part of the earth's circumference suggested by Mouton; (5) a precise and scientific terminology formulated by the same illustrious Abbé; (6) a direct and simple inter-relation between the units of dimension and mass urged by James Watt; and finally (7) international co-operation suggested by La Condamine about the middle of the 18th century.

In 1790, new systems of weights and measures were introduced independently in the House of Commons of England by John Miller, in the House of Representatives of the United States by Thomas Jefferson, and in the National Assembly of France by Prieur and Talleyrand. The noteworthy project of Prieur du Vernois was presented to the French Assembly 9 Feb. 1790. The following month Talleyrand published a proposition concerning weights and measures which was later presented to the Assembly, referred to the Committee on Agriculture and Commerce, and considered by the Assembly 8 May. A decree sanctioned by Louis XVI. on 22 Aug. 1790, approved the establishment of a new system, invited other nations to join in fixing the unit, and referred the whole subject to the French Academy for action. Representatives of Spain, Italy, Denmark, Netherlands, Switzerland and France actually participated in the consideration of the project. The Academy Commission, consisting of Borda, Lagrange, Laplace, Monge, and Condorcet, made a full report 19 March 1791, which resulted in the decree of 26 March 1791, sanctioning the choice of the earth's quadrant as the basis of the new system, the use of the decimal ratio, and a simple inter-relation between the units of dimension and mass. An arc of 10° on the meridian of Paris was measured with the utmost precision to deduce the length of the metre. The survey was successfully completed by Delambre and Mechain in spite of extreme technical and political obstacles. Meantime, Lavoisier and Haüy, assisted by LeFevre-Gineau and Fabbroni, determined with the utmost care the weight of a definite volume of water as a basis for the new unit of mass. The nomenclature of the new system, based upon a report by the Academy, 19 Jan. 1793, was fixed by law 7 April 1795, after 18 months of discussion.

In 1799, an international commission composed of representatives of ten independent nations was convened in Paris to deduce and establish the precise length of the proposed metre. The adoption of the report of this Commission by the Legislature 22 June 1799, marked the real birth of the metric system. Platinum standards of the metre and kilogram were adopted and formally deposited in the Palais des Archives at Paris. Copies of the standards were deposited at the Conservatoire des Arts et Métiers, the Observatory of Paris, and others were presented to several countries including the United States. Thus was established the metric system which within a century became the legal system of more than two thirds of the civilized world. Founded upon the simplest principles and the fundamental modes of thought, the system presented such admirable features that it rapidly grew in favor among the

intelligent classes in all countries. By the close of the 19th century more than 40 countries had adopted the system, and in scientific work its use had become world-wide.

The metric system was from its inception distinctly an international system, but in order that it should attain its fullest success, it was imperative that provision be made for international standards and their proper preservation as well as for national standards and their regular re-comparison with the fundamental standards of the system. This step was taken at the next international conference. As far back as 1821, John Quincy Adams in his classic report on Weights and Measures made to the Senate 22 February of that year, had urged an international conference and an agreement among nations to consider the metric system "conceived and thus far executed by France and to co-operate with her to the final and universal adoption of her system." This suggestion was not carried out until 1870. During the half century following Adams' report, international intercourse increased by leaps and bounds, the metric system spread from continent to continent, while science and industry experienced a growth unprecedented in the world's history, all of which accentuated the need of accurate and uniform standards. Inspired by these great movements and the growing demands for precision and uniformity everywhere, the emperor of France, Napoleon III, by decree of 1 Sept. 1866, called an international conference to arrange among other things for the construction of new metric standards to meet the most rigorous demands of modern metrology. Twenty-four nations appointed delegates and the first session opened at Paris 8 Aug. 1870. Five meetings were held and important preliminary work inaugurated, but the session was unfortunately cut short by the Franco-Prussian war. At the second session which was convened 24 Sept. 1872, thirty nations were represented and remained in session until 12 October.

After careful consideration, the Commission passed forty resolutions to govern the construction of the new standards; 21 of these propositions referred to the metre, 12 to the kilogram, and two refer to their preservation and the guarantee of their invariability. The necessary scientific investigations were made by eleven special committees of savants. It was decided that all the standards should be constructed of an alloy of ninety per cent platinum with ten per cent iridium, and a tolerance of two per cent in excess or deficiency (resolution No. 6). This refractory alloy possesses extreme hardness, a fine grain, and withstands chemical action to a remarkable degree. The iridium-platinum alloy was adopted upon the suggestion of Henri Sainte Claire-Deville, who with his brother Charles and the physicist Stas of Belgium devoted the ensuing 10 years to attaining the requisite purity of the constituent materials, in their investigations opening up new chapters in the chemistry of the refractory alloys. The first ingot weighing 525 pounds known as the "alloy of 1874" failed to meet the high standard of purity set by the Commission. Several standards, however, were constructed, one of which is deposited at Washington. A new alloy was prepared in the most careful manner by Messrs. Johnson, Matthey & Company, of London, and after repeated meltings the required homoge-

METRIC SYSTEM

neity was attained. The purity was tested by the chemists of the International Committee and of the French section and was found to exceed the requirements in this respect. Thirty-one prototype metres were made from this casting, and the copy corresponding to the true length of the metre of the Archives was selected as the international standard of length and is designated by the letter *m*. The International Prototype Metre is an iridio-platinum bar 102 centimetres in length of a cross section, 20 millimetres square, intermediate between the capitals *H* and *X*, and of such form that the surface bearing the graduations lies in the neutral plane of the bar. The lines used to define the metre were traced at the Conservatoire des Arts et Métiers. There are three lines engraved near each end of the bar. They are 6 to 8 microns wide and about a half millimetre apart, and the metre is defined as the distance between the middle lines of each group when the temperature of the bar is at 0° Centigrade. Thirty-nine prototype kilograms were constructed, the one most nearly corresponding to the kilogram of the Archives being selected as the international standard of mass and designated by the letter *k*. On 26 Sept. 1889, the International prototypes were unanimously approved, adopted, and formally deposited in a special vault at the International Bureau of Weights and Measures, fastened by three locks, the keys of which were delivered, respectively, to the Custodian of the Archives of France, the President of the International Committee, and the Director of the Bureau. The vault in which the prototypes are preserved is opened not oftener than once a year, these three officers being present.

The national prototypes of the metre and kilogram, furnished to the States signatory of the convention of the metre, were of the same material, form, and perfect construction as the international standards themselves. Each contributory country received two copies of each international standard, to be used as a working standard and a reference standard, respectively. The standards were accompanied by attested certificates of comparison, two hard glass thermometers, each with a table of corrections referring to the international hydrogen scale, a piece of the alloy cut from the end of the metre bar for testing the coefficient of expansion, and each kilogram was accompanied by a rock crystal bed plate and other accessories requisite to the safe conveyance of the standard. Metre prototypes numbered 21 and 27 were allotted to the United States, having corrections at 0° Centigrade of +2.5 microns and -1.6 microns, respectively, the probable error of the determination, based upon 784 individual comparisons, being below 0.2 microns. The kilogram prototypes allotted to the United States are numbered 4 and 20, with corrections of -0.075 and -0.039 milligrams, and volumes of 46.418 and 46.402 millilitres, respectively. These copies display a noteworthy precision of adjustment. The probable error of the determinations, based upon 1092 individual weighings, is less than 0.002 milligrams. The copies of the metric standards sent to the United States were received by the President at the Executive Mansion 2 Jan. 1890, the seals broken in his presence, and a certificate authenticating the standards was signed by President Harrison. The standards were at once deposited in the Office of Standard Weights

and Measures and are now in the custody of the United States Bureau of Standards, which was established 1 July 1901, by act of 3 March 1901.

The International Bureau of Weights and Measures was established by the Metric Convention of 20 May 1875, signed at Paris by the plenipotentiaries of most of the civilized nations of the world, the United States being the first to sign. This Bureau has the custody of the international standards of the metric system, to which all prototypes of the world are referred for verification, in terms of which the units of all systems are now stated. The Bureau is maintained jointly by the contracting states. The International Bureau is located at Sevres, a suburb of Paris, on neutral territory ceded by France for this purpose. The work of the Bureau is supervised by an International Committee of Weights and Measures which is itself under the control of a general conference for weights and measures, composed of delegates of all the contracting governments. This conference meets at least once every six years to discuss and initiate measures necessary for the dissemination and improvement of the metric system, and to pass upon new fundamental metrological determinations.

THE METRIC SYSTEM.

The fundamental unit of the metric system is the "METRE," which is the unit of length. From this unit the units of mass (gram), and capacity (litre), were derived. All other units are the decimal subdivisions or multiples of these. Furthermore these three units are simply related so that for practical purposes one cubic decimetre of water weighs one kilogram and contains one litre. The metric terms are formed by combining the words "metre," "gram," and "litre" with the six numerical prefixes.

	PREFIXES	MEANING	UNITS
milli-	= one thousandth	or .001	
centi-	= one hundredth	or .01	"metre" for length.
deci-	= one tenth	or .1	
unit	= one	1.	"gram" for weight.
deka-	= ten	10.	
hecto-	= one hundred	100.	"litre" for capacity.
kilo-	= one thousand	1000.	

The following tables are formed by inserting successively the names of the three units in the column headed "unit" in the above outline table:

LENGTHS.

Ten milli-metres	=	One centi-metre.
" centi-metres	=	" deci-metre.
" deci-metres	=	" metre (about 40 inches).
" metres	=	" deka-metre.
" deka-metres	=	" hecto-metre.
" hecto-metres	=	" kilo-metre (about ¾ mile).

The square and cubic units are the squares and cubes of the linear units.

WEIGHTS.

Ten milli-grams	=	One centi-gram.
" centi-grams	=	" deci-gram.
" deci-grams	=	" gram (about 15 grains).
" grams	=	" deka-gram.
" deka-grams	=	" hecto-gram.
" hecto-grams	=	" kilo-gram (about 2 pounds).

VOLUMES.

Ten milli-litres	=	One centi-litre.
" centi-litres	=	" deci-litre.
" deci-litres	=	" litre (about 1 quart).
" litres	=	" deka-litre.
" deka-litres	=	" hecto-litre (about a barrel).
" hecto-litres	=	" kilo-litre.

The ordinary unit of land area is the HECTARE (100 metres square), and is equal to 100 Acres. The hectare is about 2½ acres.

The metric ton is 1000 kilograms.

The United States has already adopted the metric system for many purposes. In 1866, Congress legalized it for all purposes (Revised Statutes, sec. 3569); all the States have been

provided with copies of the metric standards (Joint Resolution of Congress, approved 27 July 1866); foreign postal rates are fixed in metric units (Revised Statutes, sec. 3880); the subsidiary silver coinage is based on specified metric weights (Revised Statutes, sec. 3513); and in August, 1894, Congress adopted the international electrical units based on the metric system as "the legal units of electrical measures in the United States." (Revised Statutes, Sup. Vol. II., ch. 131). By proclamation of 1899, the metric system was made obligatory in Porto Rico, and by Act of 1901 was made the legal system of weights and measures in the Philippines. The most important actions, however, were the establishment in 1875 of the International Bureau of Weights and Measures by the United States and other leading countries of the world (United States Statutes at Large, Vol. XX., page 107), and the adoption of the metre and kilogram as the fundamental standards of the United States, from which the yard and pound are to be derived, 5 April 1893.

S. W. STRATTON,

Director, United States Bureau of Standards.

Met'ronome, in music, an instrument consisting of a weighted pendulum moving on a pivot and set in motion by clock-work. It was invented about 1814, for the purpose of determining, by its vibrations, the quickness or slowness with which musical compositions are to be executed, so as to mark the time exactly.

Metrop'olis City, Ill., city, county-seat of Massac County; on the Ohio River, and on the Illinois Central Railroad; about 190 miles south by east of Springfield. The place was settled in 1700 by the French, and a Fort Massac was erected; but no permanent settlement was made until 1838. It was incorporated in 1843. The city has lumber mills, basket and box factories, flour mills, potteries, veneer and furniture factories. The city is the trade centre for nearly all of Massac County. It is a healthy locality, built on a high bluff, with an incline toward the river. There are good schools, the R. W. McCartney Public Library, the Odd Fellows' Temple, a sanatorium, a city hall, court-house, music-hall, and several fine churches. Pop. (1890) 3,573; (1900) 4,069.

Metropolitan, Greek name of an archbishop, whose see is the chief place or metropolis of a province. The metropolitan is above the bishop, but below the patriarch. The title of patriarch, however, is in use only in the Eastern churches. In Russia the metropolitan is at the head of the hierarchy. In the Roman Catholic Church an archbishop may bear this title even though he does not have a metropolis

as a see, thus the archbishop of Westminster is styled metropolitan.

Metropolitan Museum of Art. See ART, METROPOLITAN MUSEUM OF.

Metsu, mêt'sü, or **Metzu**, mêt'zû, **Gabriel**, Dutch genre painter: b. Leyden 1630; d. Amsterdam 22 Oct. 1667. He studied under his father, Jacques, a Fleming, and under Dou in Leyden; was greatly influenced by Rembrandt, Terburg and Frans Hals; removed to Amsterdam in 1656; and painted some of the best genre pictures of the 17th century. At The Hague may be seen his 'Hunter' and 'Music Lovers'; at the Louvre, 'The Amsterdam Market'; in the Metropolitan Museum, New York, 'The Music Lesson'; and many others throughout Europe's great galleries.

Metternich, mêt'tër-nîh, **Clemens Wenzel Nepomuk Lothar**, PRINCE, Austrian statesman: b. Coblenz 15 May 1773; d. Vienna 11 June 1859. He was educated at Strasburg; when only 17 represented the Westphalian princes at the coronation of Leopold II.; settled in Vienna in 1794; assured himself a place in diplomacy by marrying the daughter of the Austrian chancellor Kaunitz in 1795; and at the Congress of Rastatt again represented the Westphalian collegium. In 1801 he was sent to Dresden by Austria; two years later to Berlin; and in 1806 to Paris. On the outbreak of the war between France and Austria, Metternich was put to much personal inconvenience by Napoleon, who forcibly detained him for some time. Thereafter he entered eagerly into the anti-Napoleonic league; assisted in the formation of the Quadruple Alliance; and as Germany proved successful, took no part in the national sentiment which arose, but directed himself solely to the aggrandizement of Austria, hence doing his best to preserve the French boundaries as they had been and to render Austria the only gainer among the Powers by the reapportionment of Europe. In the years that followed he carried things his own way in Austria, planned the Holy Alliance, and was extremely reactionary in his internal and foreign policies. The revolution of 1830 in France showed the ill-success of his programme; and the rising of 1848 and the insurrection in Vienna itself made it necessary for the emperor Ferdinand to demand his resignation. He kept some power even then, his counsel being frequently sought. Consult: Gross-Hofinger, 'Fürst Metternich und das österreichische Staatssystem' (1846); Mazade, 'Un chancelier d'Ancien Régime: Le Règne diplomatique de M. de Metternich' (1880); Malleson, 'Life of Prince Metternich' (1888); Demelitsch, 'Metternich und seine auswärtige Politik' (1898).

Metz, mêts, Germany, an important fortified city, and episcopal see of Alsace-Lorraine, on the Moselle, which here divides into several arms, 79 miles northwest of Strasbourg. The major part of the town stands on a height within the fortifications, outside of which there is a series of strong detached forts. The cathedral is a late Gothic structure, surmounted by a spire of open work 397 feet high. The manufactures consist of woollens, cottons, hosiery, hats, muslin, glue, leather, etc. Several battles were fought in the neighborhood and under its walls between the Germans and French in August 1870. The Germans subsequently invested the town, and being reduced to a state of

MEUDON — MEXICAN ARCHÆOLOGY

famine, on 28 October it capitulated with 180,000 officers and men under the command of Marshal Bazaine. It was included in the cession of territory to Germany at the Peace of 1871, and its fortifications have been greatly strengthened since. (See FRANCO-GERMAN WAR.) Pop. (1900) 58,424.

Meudon, mè-dôn, France, a town southwest of Paris, near the Seine, on the railway to Versailles, six miles to the west. It had formerly a fine château, built by Louis XIV., surrounded by the Forêt de Meudon, still a favorite holiday resort of the Parisians. This château was fitted up in 1812 by Napoleon I. for Marie Louise, and it was a residence of the Napoleons under the Second Empire, but was ruined during the siege of Paris in 1870. An astronomical observatory has since been established in the remains of the castle. Meudon has glass-works, bleach-fields, extensive government munition works, and other industrial establishments. Rabelais was for a short time curé of Meudon. Pop. (1901) 9,702.

Meulen, mè'lên, Adam Frans van der, Flemish painter: b. Brussels 11 Jan. 1632; d. Paris 15 Oct. 1690. He studied under Snayers; removed to Paris; and there became court painter to Louis XIV., for whom he painted many battle scenes, of which 23 are now in the Louvre. Many were painted on the spot during action, and all excel by the skill with which horses are drawn and by painstaking detail.

Meunier, mè-nê-â, Constantin, Belgian artist: b. Brussels 1831. He is known as a historical and genre painter as well as a sculptor of considerable power, though his naturalistic pictures are sometimes revolting; and it would seem as if his studies in Madrid had brought him under the influence of Ribera and his sanguinary school. He has produced some vivid pictures of life in the colliery district amid whose unlovely surroundings he has made his home. His 'Martyrdom of Saint Stephen' in the Ghent Museum, is quite in the spirit of Ribera and shocks the mind by its brutal literalness. 'The Peasants' Rebellion' is an example of his energy and force as a realist in modern life. His statue 'The Lost Son' is in the Berlin National Gallery.

Meurice, François Paul, frân-swâ pöl mè-rês, French dramatist: b. Paris 1820. He was educated at the Collège Charlemagne and entered upon a literary career. He worked for a time in collaboration with Dumas, with whom he made a translation of Hamlet, and was entrusted by Victor Hugo, his brother-in-law, with the publication of his complete works. He published: 'Benvenuto Cellini' (1852); 'Fanfan la Tulipe' (1858); 'Cadio' (1868); 'Césara' (1869); etc.

Meuse, mèz, or mûz, a river which rises in France in the south of the department Haute-Marne, and with a northward trend crosses the northwestern corner of the department Vosges where between Bazeilles and Noncourt it has a subterranean course of three and a half miles. It traverses the departments Meuse and Ardennes, and on reaching Sedan enters Belgium. At Namur where it receives on the left its largest tributary, the Sambre, almost doubling its volume, it changes its course to northeast,

and passes Liège, where it is augmented by the Ourthe; it separates Dutch from Belgian Limburg, passing Maestricht and Roermond, at the latter of which it receives the Roer. In the northern part of Dutch Limburg its course is changed to northwest, and subsequently it becomes west. The whole of its after-course is through the Netherlands, in which it forms for some distance the boundary between North Brabant and Gelderland. It finally joins the left bank of the Waal, one of the arms of the Rhine, and gives its name to the accumulated flood of these streams, which, proceeding west through Holland proper, is divided near Dordrecht into two great rivers, the one of which bends round to the north and reaches Rotterdam; the other branch continues west; shortly after the two branches again unite and discharge themselves into the North Sea. The direct length of the Meuse is 230 miles; and its length including windings is 580 miles. It is navigable for about 460 miles.

Mexcala, mäs-kä'lä, or **Mescala**, mës-kä'lä, a river of Mexico, in the southern part, which has its rise in the mountains southeast of the city of Mexico, and flows generally west to the Pacific. It is called Atoyac in the first part of its course, and on the boundary line between the states of Michoacán and Guerrero, it is called Rio de las Balsas. The port of Zacatula is at its mouth. It is a swift-flowing stream, and has a number of low cascades and rapids. The water-power is used for only a small number of mills in the towns along its banks.

Mexican Archæology is represented by interesting relics of every conceivable description, exhibiting the aboriginal condition and progressive stages of culture among the many pre-historic and historic races that inhabited Mexican territory in pre-Columbian periods (see AZTEC CONFEDERACY). From the flaked flint arrowheads of the palæolithic savage to the elaborately carved gold and other ornaments, and vast stone buildings of the Aztecs and Toltecs of the Nahua nation, these relics are to be found in bewildering profusion. The number of minor statuettes, carvings, amulets, and ornaments in stone is enormous, as are also metal objects of the Bronze Age, and finely carved articles of wood and other material, in which the graving implements employed were of stone and copper, iron not having come into use. Even in the variety of their richly colored pottery, beautifully ornamented with elaborate and symbolic designs, is traced strong evidences of the separate tribes and nations, each possessing its individual and distinctive ware. All these relics bear mute testimony to the customs, habits, or religious rites of native races, for the study of which Mexico affords an inexhaustible and ever productive field, as witnessed by the recent travels and researches of Professor Carl Lumholtz, the eminent ethnologist among the primitive Huichols or Virarikas, a little known tribe of Indians in the state of Jalisco. These have added a vast amount of information on aboriginal ancestral rites and customs, the Huichols having carefully preserved traditions which include a version of a flood which lasted for five years, and an ark which rested on a mountain in Mexico, instead of Mount Ararat, the representations of this ark, and Grandmother Growth, the Mother of the Gods who

MEXICAN HAIRLESS DOG — MEXICAN LITERATURE

predicted the flood, being among the objects of superstitious veneration that are used in their ceremonies.

But the most impressive of Mexican archaeological features are the ruins of monuments, temples and cities scattered throughout the land. Among these the more important are the cliff ruins and deserted pueblos of the Casas Grandes and other localities in the state of Chihuahua in the north; those of Quemada in Zacatecas farther south; of Tula, the northernmost centre of Toltec culture; the remains of chambers, statuary, etc., carved out of the solid rock on the hill of Texcoco, a few miles beyond Texcoco; the pyramids, and the street of the dead, half a mile long, lined by *teocallis*, ruined temples and other structures, among which were found the Almaraz monolith, weighing over 18 tons, at San Juan Teotihuacan, 25 miles north of Mexico city; the pyramid at Cholula, west of the city of Puebla and about 60 miles southeast of Mexico city, the largest in the country, upward of 1,400 feet at its base, and nearly 200 feet high, which was stormed and captured by Cortes, who replaced the Toltec temple, crowning its summit, by a Roman Catholic church; the vast ruins on the oblong conical hill two miles in circumference and 400 feet high at Xochialco, about 65 miles southwest of Mexico city; and the remains of the six palaces, three pyramids, and other structures at Mitla, 15 miles southeast of Oaxaca. Minor groups are to be found at Monte Alban, the ancient capital of the Zapotecs, Tehuantepec, and Zachila in Oaxaca; and at various places in the Huastecan and Totonacan districts, and the Maya region. Tenochtitlan, the Aztec capital, and Texcoco, the Acolhuan capital, were with the downfall of the inhabitants leveled to the ground by the Spaniards, and scarcely any vestige of their having existed is to be found. The site of Tenochtitlan is now occupied by Mexico city and the present cathedral is built where the great *teocalli*, reached by 120 steps, stood; here during excavations in 1789 were found two notable relics of the Aztec capital, the Calendar stone, and the Huitzilopochtli, a composite idol representing the cruel god of war and goddess of death. These are carefully preserved in the Museo Nacional in Mexico city, together with a vast quantity of other valuable archaeologia, including numerous hieroglyphic and pictographic codices in the native ideographic writing, the decipherment of which is gradually adding to the sum of knowledge concerning ancient Mexico. See MEXICAN LITERATURE. Consult Bandelier, 'An Archaeological Tour in Mexico' (1885); Campbell, 'Complete Guide and Descriptive Book of Mexico' (1885); Ober, 'Travels in Mexico' (1898).

CHARLES LEONARD-STUART, B.A.,
Editorial Staff, 'Encyclopedia Americana.'

Mexican Hairless Dog, a small terrier-like dog, of uncertain origin, without hair except a tuft on the crown of the head, another on the tail and a few scattering wisps on the body; the skin is grayish black, wrinkled and dry. Clavigero describes a large hairless dog found among the Mexicans by the Spanish conquerors, whose puppies were esteemed as an edible delicacy; and others are recorded as having occurred in ancient Peru and on various of the West Indian islands. A hairless dog somewhat resembling a small greyhound is kept

by the Chinese, and others of different form are to be found in Eastern India and in some parts of central Africa.

Mexican Jumping Bean. See JUMPING BEAN.

Mexican Literature. In the summer of 1518 when a Spanish squadron commanded by Juan de Grijalva discovered Mexico, then ruled by Montezuma II., he found there a highly developed nation with organized armies, official administrators, courts of justice, agricultural, mechanical, and fine arts, and stone buildings, some of them of vast proportions, and conspicuously ornamented. When the first ambassadors sent by the Mexican king to Cortes arrived, the Spanish conqueror was particularly impressed by the artists in their train, who in their pictographic and hieroglyphic writing made descriptive sketches of the Europeans and their accoutrements, in reality acting as our modern reporters, and giving the Old World the first idea of a new literature. The astonishment of European scholars and their researches into the origin of these hitherto unknown peoples gave rise to a whole literature. The details of ancient Mexican civilization are now generally admitted to be of Asiatic origin, and dating from an intercourse as recent probably as the Christian era. The Aztec calendar of 360 days divided into 18 months of 20 days each compared with that in use in Eastern Asia exhibits marked points of similarity, and actual documents of native Aztec history in their ideographic writing, or copies of them, are open to the study of scholars, and are being deciphered and published from time to time. After the Spanish Conquest, interpretations of many were drawn up in writing by Spanish educated Mexicans, and histories founded on them with the aid of the traditional memory were written by Fernando-de-Alva-Ixtlicochitl (1568-1648), the royal Texcucan chronicler, Tezozomoc, son of Cuiclahuac, the last Mexican emperor, and others. The documents purporting to be histories, written by natives in later times, thus more or less represent real records of the past, but the task of separating the preponderant mythical part from what is real history is of the utmost difficulty. Turning to the native chronicles of the Mexican nations, these are found to be substantial records, going back to the 12th or 13th century, with some vague but not worthless recollection of national events from times some centuries earlier. These last mentioned traditions, in some measure borne out by linguistic evidence of names of places, tribes, and persons, point to the immigration of detachments or branches of a widespread race speaking a common language, which is represented to us by the Aztec, still a spoken language in Mexico. Chief of these branches were the Toltecs, with whom is associated the mysterious tradition of Quetzalcoatl, a name which presents itself in Mexican religion as that of a great deity, god of the air, and in legend as that of a saintly ruler and civilizer. His brown and beardless worshippers described him as of another race, a white man with noble features, long black hair and full beard, dressed in flowing robes. He came from Tullan or Yucatan (stories differ widely) and dwelt 20 years among them, teaching men to practise austerity and virtue, and to hate violence, war, human and animal sacrifices. Legends tell of

MEXICAN NUN—MEXICAN WAR

his teaching picture-writing, the use of the calendar, artistic silver work, and building, of which the mound of Cholula and other edifices bear witness (see MEXICAN ARCHAEOLOGY), but at last he departed, some say toward the unknown land of Tlapallan, but others to Coatzacoalco, on the Atlantic coast, on the confines of Central America. Thence before his final disappearance he sent back his companions to tell the Cholulans that in a future age his brethren, white men and bearded like himself, would land there from the sea where the sun rises, and come to rule the country. About 1430 took place the triple alliance of the Acolhua, Aztec, and Tepanee kings, whose capitals were Tezcuco, Tenochtitlan, now Mexico, and Tlacopan. The Aztecs then became so predominant that the rest of native history may be fairly called the Aztec period, notwithstanding the picturesque magnificence and intellectual culture which made Tezcuco celebrated under Nezahualcoyotl and his son Nezahualpili (see AZTEC CONFEDERACY).

After the Spanish Conquest, Mexico became the scene of active original study, and the foundations of the literature of the New World were laid, when in 1536 Juan Cromberger, the publisher of Seville, under the patronage and advice of viceroy Antonio de Mendoza and Juan de Zumarraga, first bishop of Mexico, established a printing-press, with Juan Pablos as his foreman. The chief of early works relating to native history are those of Motolinia, 'Historia de los Indios de la Nueva Espana' (1541); Sahagun, 'Historia de las Cosas Antiguas de los Indios' (1566); Diego Duran, 'Historia de los Indios de Nueva Espana y islas de Tierra firme' (1581); the princely Tezozomoc, 'Cronica Mexicana' (1600); Torquemada, 'Monarquia Indiana' (1615); the 'Letters of Cortes,' the standard edition of which is the handsome publication of Lorenzana (Mexico 1770); and the works of native authors including Camargo, Chimalpain, the three Ixtlilxochitls, Pomar, Tobar, Zapata and others. Early verse is represented by Saavedra Guzman, 'El Peregrino Indiano' (1599), and by Villagran's sprightly epic on the New Mexican Conquest, both poor poetry, but interesting and valuable chronicling. From its establishment in 1536 to 1600 over 100 volumes were published by the native press, the bulk of a religious character including catechisms, vocabularies, sermons, etc., in the various Nahuatl dialects, the remainder volumes of law, history, medicine, music, etc., in Latin and Spanish.

The Mexican literary celebrities of the 17th century were Carlos de Sigüenza y Gongora (1645-1700), the cosmographer of New Spain, professor of mathematics in the University of Mexico, the author of numerous scientific and literary works in prose and verse; Enrico Martinez, 'Reportorio de los Tiempos y Historia natural desta Nueva Espana' (1666); the Pueblan poet Matias Bocanegra; the poetess Juana Inés de la Cruz (1651-95), surnamed on account of her attributes 'The Tenth Muse,' who left the vice-regal court to become a nun; the dramatists Fray Ruiz de Alarcon and Eusebio Vela; and Fray Augustin de Vetancourt, whose 'Teatro Mexicano' appeared in 1698. The 18th century was comparatively barren of original work, but distinguished by general and classic culture and prolific in journalistic development and progress, the leaders of which were José

Antonio de Alzate, Francisco Sagahun de Arevalo and José Ignacio Bartolache. Among writers of local history of this period are Veytia (1718-79) and Morfi (d. 1793).

The list of Mexican students, historians, and literary men of the 19th century is a long one. Chief of local historians and a prominent statesman is Lucas Alaman (d. 1853) with 'Disertaciones sobre la Historia de Mejico' (3 vols. 1844-9), and 'Historia de Mejico' (5 vols. 1849-52); others of prominence are Orozco y Berra (1816-81), 'Historia Antigua de Mejico'; Bustamante (d. 1848); Mora, Ramirez, and Zamacois; while of interest and value is the 'Diccionario geografico, historico, y biografico de los Estados Unidos Mexicanos' (1889) of Antonio Garcia Cubas. Among poets are the physician Manuel Carpio (1791-1860), best represented by 'La Cena de Baltasar'; Guillermo Prieto (1818-97), poet and statesman, whose 'Musa Callejera' (Highway Muse), and 'Romancero Nacional,' made him the national laureate; Ignacio Manuel Altamirano, orator, poet, and novelist, whose novel 'Clemencia' is his best known work; Salvador Diaz Miron; Juan de Dios Peza; Acuña; and José Joaquin Fernandez de Lizardi, who has been named 'El Pensador Mexicano.' Representative dramatists are Rodriguez Galván and Fernando Calderon, and in comedy Manuel E. Gorostiza (1789-1851), whose most popular works are 'Contigo pan y cebollas' and 'Indulgencia para todos.' One great feature of modern Mexican literature is the moral and material support given by the Government, the Ministerio de Fomento (Ministry of Encouragement), supplying the funds for the issue of any work that—with a conservative judgment—is deemed worthy. Among recent examples are the historical works of the late Icazbalceta, and of Alfredo Chavero; the monographs of Peñañel and Garcia-Cubas, the legends of Gonzalez Obregon, etc. Consult: Piementel, 'Historia critica de la literatura y de las ciencias en Mexico' (1885); Lummis, 'The Awakening of a Nation' (1899). Mexican Nun, The, name given to JUANA INÉZ DE LA CRUZ, Mexican poet: b. San Miguel de Nepantla, near Mexico, 12 Nov. 1651; d. Mexico 17 April 1695. She was well known in Mexico for her learning, took the veil in the convent of San Jerónimo, after some 27 years abandoned her studies wholly for the duties of the convent, and sold her library in aid of charity. Her death occurred during a severe epidemic. Among her works are: 'Poésias Sagradas y Profanas'; 'El Neptuno Alegórico'; and the comedy 'Los Empeños de Una Casa.'

Mexican Subregion, a faunal district of the Neotropical region embracing the low hot coast region of Mexico, and the tropical lowlands southward to the Isthmus of Darien. It is not very clearly defined, nor very distinctive in its faunal characteristics, which are essentially tropical. See ZOOGEOGRAPHY.

Mexican Tea. See GOOSEFOOT.

Mexican War, The. The annexation of Texas in 1845 laid the foundation for the war with Mexico. Although Texas had been for many years practically free, and had been recog-

MEXICAN WAR

nized by the United States, England, France and other countries, yet Mexico still refused to acknowledge its independence. When therefore the United States proposed to admit Texas into the Union, Mexico gave warning that the annexation would be equivalent to a declaration of war, and 6 March 1845 protested, and soon afterward withdrew her minister and severed diplomatic relations. Her acts, however, scarcely justified her threats, as at that time at least little or no preparation was made for war. It has therefore been claimed that had the American government used a conciliatory policy peace might have been preserved, and friendly relations re-established.

At the moment, however, the Mexican people and authorities were in a rather belligerent attitude, due in part to pride, and in part to an expectation that the United States would soon be involved in a war with Great Britain over the Oregon boundary, in which case Mexico would have a powerful ally to aid her. Did President Polk at this point seek to strengthen this hope in the minds of the Mexicans, intending at the proper moment to make a compromise and peace with England, as was done, and thus leave Mexico at the mercy of the United States? Perhaps history can never answer the question, but events at least seemed to march in harmony with the thought. For Mexico soon found herself in the dilemma that she must either sell California to the United States, receiving in return a goodly sum of money to appease her pride, or engage in a war to sustain her honor and territorial integrity. Mexico bravely, but perhaps not wisely, chose the latter alternative, not fully realizing the inequality of the contestants, nor the depth of the humiliation to which she would be subjected. Doubtless President Polk preferred to acquire California without war; but its acquisition was to be the principal measure of his administration. Hence if war was the only means to secure it, war it must be; at least enough to get possession of the desired territory, then he would be glad to return to a peace policy.

Causes of the War.—The immediate occasion however, of the war was the dispute in regard to the western boundary of Texas. Proclaiming her independence in 1836 Texas asserted that her western boundary was the Rio Grande to its source, thence due north to the 42d degree of north latitude. The following year the United States recognized her independence, and in December 1845, by a joint resolution, admitted her into the Union as a State, providing that boundary disputes were to be settled by the United States. President Polk accepted the boundary line claimed by Texas, and 13 Jan. 1846 ordered General Zachary Taylor to march to the eastern bank of the Rio Grande as the western boundary of the United States. Mexico insisted that the Nueces River—100 miles eastward—was the true western boundary of Texas, and therefore that Gen. Taylor was now on Mexican soil. On 25 April 1846, the first blood was shed in a conflict between a band of Mexican troops that had crossed to the eastern side of the Rio Grande and a company of American soldiers. The news of this action was immediately communicated by Gen. Taylor to President Polk, who sent his now noted message to Congress, asserting that war was begun by the act of Mexico on American soil. Congress ac-

cepted, after a stormy debate in the Senate, the President's statement, and war was recognized as existing.

Other causes than the two already noted were also at work, and help to make a decision in regard to the justness of the war still more difficult. Mexico for many years had been in a chronic state of revolution. The natural result followed. American citizens in Mexico sustained property losses, and doubtless were frequently unjustly arrested and even imprisoned. Claims arising from these causes had been in part settled under a convention of 1840, but many of them were still pending. Some were just; more, either unjust or extravagant in amount. President Polk united these unsettled claims with the boundary question, and demanded that Mexico receive an envoy extraordinary with power to settle both—on its face an eminently fair proposition. On the other hand, Mexico professed to be ready to receive an ambassador to settle the boundary dispute, but declined to receive Mr. Slidell as our minister when commissioned to settle all disputes, insisting that the two questions were distinct in kind and origin and should not be united. President Polk in his message asserted that this action of Mexico was in violation of her promise to receive a minister, and hence justified his administration in its measures, and forced him to take possession of the disputed territory.

The need of more slave territory was perhaps another factor in causing the war. At least many from the South took an aggressive position on all questions in dispute between the two countries and thus made a peaceable settlement more difficult. Both the economic and the political reasons for more territory began to be felt by 1846—the one to have new soil over which to spread the land-exhausting system of slavery; and the other to have new territory out of which to carve new slave States that the equilibrium between slave and free States might be maintained. Some other forces tending to arouse the war and aggressive spirit may be noted. The cry of "manifest destiny" played a part. Many, especially in the West, felt that the Pacific Ocean was the natural western boundary of the United States. They also demanded the "Golden Gate" that commerce might be opened up with the Orient. The two great parties—the Whigs and the Democrats—divided quite sharply on the question; in fact so completely that the war became almost a party, instead of a national, war. The Democrats as a rule supported the administration and its claim that the war was just. The Whigs, on the contrary, asserted that it was a most unholy and unrighteous war, and characterized it as Polk's war. Lincoln entering Congress in 1847 became a severe critic of the policy pursued, while Tom Corwin of Ohio went so far as to use this language: "If I were a Mexican I would tell you, 'Have you not room in your own country to bury your dead men? If you come into mine we will greet you with bloody hands, and welcome you to hospitable graves.'"

President Polk summarized his reasons for recommending that Congress recognize war as existing as follows: "The grievous wrongs perpetrated by Mexico upon our citizens throughout a long period of years remain unredressed; and solemn treaties . . . have been disre-

MEXICAN WAR

garded. . . . Our commerce with Mexico has been almost annihilated." He then adds: "As war exists, and . . . exists by the act of Mexico herself, we are called upon by every consideration of duty and patriotism to vindicate with decision the honor, the rights, and the interests of our country."

The Campaigns.—The war with Mexico was accepted as a fact by Congress 13 May 1846. There were four principal fields of action in its prosecution. (1) Along the Rio Grande, under the command of Gen. Zachary Taylor; (2) in California, where Capt. John C. Frémont and Admiral Stockton were in command; (3) in New Mexico, with General Stephen W. Kearney leading the American forces; and (4) from Vera Cruz to the City of Mexico, under the command of General Winfield S. Scott, the commander-in-chief of the American armies. Everywhere success attended the American arms. Perhaps it was the first war in history, lasting two years, in which no defeat was sustained by one party, and no victory won by the other.

Gen. Taylor defeated the Mexican troops at Palo Alto 8 May; at Resaca de la Palma the following day and captured Matamoras on the 18th. He remained near that city for some weeks to recruit his army and prepare to advance into the interior. On 24 September he entered Monterey, after a siege of four days, and a gallant resistance by the Mexicans. Taylor's most famous victory, however, was won 23 Feb. 1847, at Buena Vista. Gen. Scott gave orders, which unfortunately fell into the hands of Santa Anna, the Mexican general, for Gen. Taylor to send some nine regiments to aid Scott in his proposed attack on Vera Cruz. Santa Anna immediately marched his whole command against Taylor, expecting to crush him in this weakened condition. It was 20,000 men against about 5,000. But the skill of Taylor, the persistence of his army, the organization and equipment of the American troops, won a great victory. Taylor became the hero of the hour, and Buena Vista made him an irresistible presidential candidate.

Frémont's course in California has been a subject of keen controversy. As leader of an exploring expedition he was already in northern California, and early in 1846, was recalled to the Sacramento Valley. California was the goal of the political policy of Polk's administration. The means to secure its acquisition were uncertain. It might be gained by war; or by filling the territory with American settlers who in course of time might bring it into the Union as Texas had already been annexed; or it might be effected by securing the good-will of the native Californians who were already jealous of Mexican rule. The latter policy seems to have been the one adopted by the administration. The American consul at Monterey, Mr. Larkin, was developing this policy with a good prospect of success, it is claimed, when Frémont appeared on the scene. He seems to have developed a fourth policy, namely, the establishment of an independent government under the control of the American settlers in the Sacramento Valley. This movement resulted in the "Bear Flag Republic," and virtual civil war between the native Californians and the American settlers. At this moment the Mexican War began and the "Bear Flag" was replaced by the "Stars and Stripes." It has been claimed by some Califor-

nia historians that Frémont's course, had not the Mexican War come at the moment it did, might have lost California to the United States. The native Californians, alienated as they were by his course, might have put themselves under an English protectorate in revenge for the treatment accorded them. Be this as it may, by the end of the year all California was conquered and held by American troops, and Frémont was regarded as the hero who had won the "Golden Gate" by his energy and decision. Santa Fé was captured by Gen. Kearney, and New Mexico secured with almost no loss of life. By the end of the year, therefore, all the territory that the administration desired was in the possession of its armies, but Mexico was still unconquered.

Scott had been chafing in Washington during the summer and fall of 1846 while Taylor was winning his brilliant victories. He asked to go to the front to assume chief command, but the administration retained him at the capital under the plea of needing his advice. As it happened this Democratic war was officered by Whig generals. Scott had already been a Whig candidate for President. The charge was now made that Scott was kept from command for fear that success might make him a more formidable candidate in 1848. Finally, when he was sent to the front in January 1847, the cry was raised that the purpose was to dim the lustre of Taylor's victories, or at least to divide the popular support between the two generals in such a way as to destroy the political prospects of both.

General Scott invested Vera Cruz in March 1847, and by the 27th had captured the fortress which had been thought to be almost impregnable, and was ready to enter the city. On 8 April he started into the interior, and on the 18th captured Cerro Gordo; the 19th, Jalapa, and the 22d Perote. On 15 May he entered the important city of Puebla. Remaining here for some weeks he again advanced, in August, toward the capital, and on the 10th came in sight of the city of the Montezumas. Two important victories were won 20 August—at Contreras and at Churubusco. He captured Molina del Rey 8 September, and five days later the victory of Chapultepec gave him the City of Mexico itself which he entered on the following day with an army of only 6,000 men. The war was practically over, but the victory was so complete that it began to be a question whether there was any government left with sufficient power to negotiate a treaty of peace. An agitation began with friends both in and out of Congress as well as in the cabinet, looking to the annexation of the whole of Mexico. Calhoun on the one hand, Webster and a majority of the Whigs on the other, joined hands to defeat this plan. President Polk was finally forced to make the ultimate decision. N. P. Trist was sent in March 1847 to Mexico to make a treaty of peace. Failing he was ordered in the fall to return to Washington; but disobeying instructions he remained in Mexico, and on 2 Feb. 1848 concluded a treaty of peace in harmony with his original instructions. The administration was in a quandary. To ratify meant to condone the disobedience of Trist. To reject meant a prolongation of the war, and time to perfect the intrigue for the annexation of "All Mexico." President Polk, after some hesitation, decided to send the

MEXICO

treaty to the Senate for its consideration. Received 23 February, it was ratified, after some amendments, 10 March, by a vote of 38 to 14. On 30 May ratifications were exchanged and the war was at an end.

The Mexicans had fought bravely, even stubbornly and at times skilfully, yet in every contest even when the odds were greatly in their favor without a single victory for their cause. In part superior leadership and training won for the soldiers of the northern Republic; in part their cooler and more persistent character; but in the main it was not bravery, nor generalship, nor even character that won. It was science and education applied in the equipment of the armies, the guns of the soldiers, the cannon on the ramparts, and the powder in the arsenals which made the one so much more effective than the other that the most daring bravery was no counterpoise.

The Treaty of Peace.—The treaty of Guadalupe Hidalgo gave to the administration of President Polk the territory that his diary informs us he intended to acquire, California and New Mexico. Mexico in return for the loss of its fairest northern provinces was paid \$15,000,000, and released from all claims of all kinds held by citizens of the United States against her, estimated at \$3,250,000, which the United States assumed. Boundary lines were drawn, and provision made in regard to other questions at issue between the two countries.

Results.—Usually successfully waged wars redound to the credit of the party in power. In this case, however, the Democratic party, the author and supporter of the war, was defeated by the Whig party, the party of opposition and criticism, in the presidential election of 1848. The Whigs made use of the popularity of a successful general to defeat the party that had made his glory possible. Evidently the American people were ready to accept the fruits of the war, but also ready to punish the party that they believed had wrought in a wrong manner. Again, a large number of young officers destined to renown in later years proved their worth in this war. U. S. Grant and Wm. T. Sherman on the one side; Robt. E. Lee, "Stonewall" Jackson and Jefferson Davis on the other, in the great civil war, foreshadowed, in this Mexican struggle, the greatness that was to be theirs in the "days that tried men's souls" from 1861 to 1865. The acquisition of 522,568 square miles of territory—an empire four times as large as Great Britain, in itself—was the most important immediate as well as remote result. It was important: first, in the issues that its acquisition precipitated. Should it be slave or free territory? Who should determine its institutions? And out of this question grew the larger one, who had the right to control the institutions of the territories in general? To settle the first question David Wilmot, a Democrat of Pennsylvania, proposed the celebrated "Wilmot Proviso" (q.v.) which would exclude slavery forever from all territory acquired from Mexico. Four long years of intense and bitter debate followed. This question and a series of others were settled temporarily in the Compromise of 1850. The second question was answered by the phrase "Non-intervention," which meant, or soon came to mean, one thing to Douglas and the Northern Democrats, and another to Davis and the South. Three main theories were evolved or

defended in answer to the third query. (1) That Congress had the right to control the institutions of the territories and could make them slave or free at its will. (2) The Dickinson-Cass-Douglas doctrine of Popular or "Squatter" sovereignty:—the doctrine that the people of a territory themselves, while yet in a territorial status, determined their own institutions. (3) The radical Southern view that slaves were property, and, as property might be taken into any territory,—the common public domain of the States,—with no constitutional power anywhere to hinder or prevent. It was important secondly in its industrial and political effect on the nation. The United States now had an outlook on the Pacific Ocean comparable to that on the Atlantic. China, Japan and the East were brought within the circle of its influence. Conditions favorable to further expansion were prepared. In addition to the great effect on commerce thus prefigured, that on wealth and industry was not less. The gold, silver, copper and other mineral wealth of the Rocky Mountain region was turned into the pockets of the American people. This vast addition of territory and wealth tended also to emphasize national pride and ambition; to arouse a still more intense belief in "manifest destiny"; to develop a more optimistic tone, and perhaps also to produce a more materialistic spirit.

H. W. CALDWELL,
University of Nebraska.

Mexico, mĕk'si-ko (Sp. mā'hē-kō), **United States of**, a federal republic of the Western hemisphere, occupying a country partly in the tropics and partly in the temperate zone (lat. 15° to above 32° N.); bounded north by the United States (California, Arizona, New Mexico, and Texas) and the Gulf of Mexico, west and south by the Pacific Ocean, south also by British Honduras and a section of Guatemala, east by the Gulf and the Caribbean Sea. Capital, City of Mexico. Area (est.) 765,560 square miles; population (1900) 13,545,462—19 per cent white, 43 per cent Indian, 38 per cent mixed; about 80,000 foreigners.

Mexico is composed of 27 states, three territories, and a federal district (City of Mexico and adjacent territory), as follows, beginning from the northwest: On the Pacific and the Gulf of California, Lower California Territory. On that Gulf, Sonora; Gulf and Pacific, Sinaloa; Pacific, Tepic Territory, Jalisco, Colima, Michoacan, Guerrero, Oaxaca, Chiapas (next to Guatemala), Interior (from the north), Chihuahua, Coahuila, Nuevo Leon, Durango, Zacatecas, San Luis Potosi, Aguascalientes ("Hot Springs"), Guanajuato, Queretaro, Hidalgo, Mexico, Federal District, Tlaxcala, Puebla, Morelos. On the Gulf of Mexico (from the north), Tamaulipas, Vera Cruz, Tabasco, Campeche, Yucatan (also facing the Caribbean Sea east). It has one great city, City of Mexico, according to census of 1900 368,777 inhabitants; four others over

MEXICO

50,000 — Puebla, 88,684, Guadalajara, 83,934, San Luis Potosi, 69,050, and Leon, 58,426; and a dozen others over 25,000 — Monterey, 45,695, Pachuca, 40,487, Zacatecas, 39,912, Guanajuato, 39,404, Merida, 36,935, Queretaro, 34,576, Morelia, 33,890, Oaxaca, 32,437, Orizaba, 31,512, Aguascalientes, 30,872, Saltillo, 26,807, Durango, 26,425.

Topography.—Mexico is shaped curiously like a fish's tail, even to the notched fins at the end, where Guatemala approaches Campeachy Bay. Its extreme length is 1,900 miles; greatest breadth (at the United States), 750 miles; at the Isthmus of Tehuantepec, about 130 miles. Its great mass is the lofty Rocky Mountain plateau, which fills it nearly from ocean to ocean, leaving but a narrow strip of coast. Entering from Guatemala (where a spur connects with the limestone and coral table-land of Yucatan), the system trends west, forming a table-land 150 miles wide at Oaxaca, with a steep descent and slender coast on the Pacific, but a more gradual one by terraces to the Gulf in Tabasco and Vera Cruz. This spreads and swells northward to the vast plateau of Anahuac, 4,000 to 8,000 feet high, where the oceanic relations are reversed, the Atlantic side precipitous and the Pacific terraced. There is no single range corresponding to the Andes or northern Rockies; the so-called *cordilleras* are merely the outer escarpments of the plateau, though often far above its mean level. Loftiest of these is the Sierra Madre of the Pacific, traceable at a mean elevation of over 10,000 feet from Oaxaca to the United States. It skirts the western coast within 60 or 70 miles to the entrance of the Gulf of California; thence onward a far wider coast land has silted up. Along the Gulf of Mexico are the correspondent cordilleras of Tamaulipas and Nuevo Leon, 6,000 feet in mean elevation; and the southern central plateau maintains its height of 7,000 to 8,000 feet with great persistency to within 40 miles or less of the Atlantic. Through Lower California is a similar ridge some 3,000 feet high. The plateau is no level surface; railroad elevations north from the capital vary by 4,500 feet, declining northward; and the centre is intersected by short secondary ridges and valleys, mostly with the north-northwest trend. Most important of these is the Anahuac Cordillera, surrounding the valleys of Mexico and Puebla; its culminating point is Toluca Nevado ("snow peak"), estimated all the way from 15,000 to 19,000 feet. But across this, and generally confounded with it, is a newer transverse ridge from ocean to ocean, traced by five active or recently quiescent volcanoes and several extinct cones. The greatest is the superb Popocatepetl in the centre, southeast of Mexico City, 17,782 feet; then Orizaba, eastward bordering Vera Cruz state, 17,176 feet; and Ixtacihuatl, northeast of Popocatepetl, 16,060 feet. On the Pacific side is Colima volcano in Jalisco, 12,728 feet; and the line runs out to the Revillagigedo volcanic islands. The sierras of Guerrero, Oaxaca, and Chiapas are nearly parallel to this. Besides the peaks above, there are the great Colim Nevado in Jalisco, 14,350 feet; three others of over 13,000, and eight others over 10,000.

Hydrography.—There are no navigable streams in Mexico save the bordering Rio Grande, and that for a few miles above its mouth at Matamoras. The plateau formation,

not gradually declining to the coast but steeply scarped within a short distance of it, renders large river basins impossible; and most of them are mere torrents down the terraced mountain sides, unavailable for communication save for a few miles along the coast plain. Many have cut deep rock gorges or cañons called *barrancas* — most superb on the east, reaching 800 to 1,000 feet deep; even toward the Pacific the De Beltran barranca has sheer rock walls of 500 feet. While rivers usually gather volume as they go, from new drainage and tributary streams the Mexican in general are not appreciably larger at their mouth than near their source — having almost no tributaries, and evaporation equaling seepage. The longest interior Mexican river is the Lerma (540 miles), which, rising near Mexico City, flows westward into Lake Chapala, reappears, as the Santiago, and enters the Pacific in Tepic territory; everywhere obstructed by falls and rapids. The Balsas (also called Mescala and Zacatula) of 426 miles rises in Tlaxcala and enters the Pacific in Michoacan; the Yaqui of 390 miles runs through Sonora to the Gulf of California, and the Fuerte of 330 through Sinaloa to the same terminus. To Campeachy Bay flow the Grijalva of 350 miles, rising in Guatemala and flowing through Chiapas and Tabasco, and the Uzumacinta of 340, also from Guatemala. The rivers along this coast are all liable to sudden freshets.

Lakes are abundant, and often beautiful; the remnants of vast flooded tracts still existent for months during the rains. The swampy drainage of Chalco and Xochimilco (really one lake) into Tezcuco created Tenochtitlan or Mexico City. The chief lake district, however, is on the Pacific slope in Michoacan and Jalisco. Across their borders lies the great Chapala, about 6,000 feet high, 80 miles long by 30 wide, and 1,400 square miles in area, the third largest in the Western Hemisphere south of the United States. Eastward is Cuitzeo, 40 by 10; southward Patzcuaro, 25 by 10. In the far north, the Bolson or plain of Mapimi has Caiman Lake, 30 miles long.

Climate.—The situation of Mexico gives it a great range from tropic to temperate; its conformation produces natural varieties within this. Altitude determines three climatic levels, known as *tierras calientes*, hot lands, on the coast; *tierras templadas*, temperate lands, 3,000 to 6,000 feet above the sea; and *tierras frias*, cold lands, over 6,000 feet high. But these, except the steaming southern coast lands, are to some extent relative terms: "cold" meaning one thing on high ground at 32° north, and quite another at 15°. The hot lands have a mean temperature of about 80°, and a summer heat often of 100°; the southern cold ones rarely go below 20°, and have a mean temperature of 60°. In the Valley of Mexico, the "perpetual spring," the range is usually 65° to 75° the year through. There is no true winter, but a rainy season from June to October; the dry one November to May. Malarial fevers are prevalent on the coast, and have been somewhat in the damp Valley of Mexico; but the great drainage tunnel finished in 1903 has much improved the sanitary conditions.

Geology and Minerals.—The foundations of the plateau and the prevailing ones of the higher ranges are granites, overlaid with basalt, trap, porphyry, and recent lavas; in the Valley of

MEXICO

Mexico, interspersed with and overlaid by shales, greenstones, silicious schists, unfossiliferous limestone, etc. For 1,600 miles the Sierra Madre of the Pacific forms one of the richest mining districts of the world; its finest part being the western slope, 3,000 to 8,005 feet high. Almost every valuable metal known is here in profusion. Silver was mined by the Aztecs, and has been an important product ever since. Gold is found largely with it, also with copper; the latter exists nearly pure in Chiapas and Guanaajuato. There are enormous masses of meteoric iron ore; Cerro de Mercado mountain, a mile from Durango, is a solid mass of magnetite. Besides these are lead, antimony, mercury (in cinnabar), zinc, tin, platinum, bismuth, etc.; besides sulphur, pumice, asphalt, petroleum, rock salt, alum, marble, gypsum, and other articles, with famous mineral springs. In 1900 12,518 mining claims were on registry; and the product of the chief metals was valued at the mints as \$84,797,740. The following were the chief items in 1901: Silver, 57,656,549 ounces, value \$74,545,900; gold, 497,527 ounces, value \$10,284,800; copper, 33,943 tons, value \$18,454,809 (in 1899); lead, 62,555 tons, value \$4,051,200; iron, 3,239 tons, value \$282,300; mercury, 273,090 pounds, value \$269,700. About 100,000 persons are employed in the mines. There is also great wealth in gems,—opals, emeralds, amethysts, topazes, agates, garnets, etc.

Flora.—Mexico is very rich in forest products; with 3,400 square miles specifically termed forest land, there are 113,280 "woodland." The fancy hardwoods alone of the hot regions—mahogany, ebony, rosewood, etc.—besides the oak and pine of the temperate levels, are a mine of future wealth; there are 14 varieties of dye-woods; the caoutchouc (india-rubber) tree grows native, and in 1900 434,630 pounds of raw rubber were produced. The chief gum product, however, is chicle for chewing,—4,690,940 pounds. Medicinal plants of 233 species grow on the bottom lands, notably sarsaparilla and jalap; vanilla, cacao, and the maguey are indigenous; and on the hot lands 68 species of tropical fruits grow wild.

Fauna.—The native organisms are of northern and southern types. Of the former are the bears, wolf, and coyote, beaver, marten, otter, and skunk, buffalo, mocking-bird, and rattle-snake; of the latter, the jaguar, puma, and ocelot, the monkeys, tapir, sloth, and peccary, alligator, iguana, boa constrictor, scorpions and tarantulas, parrots, trogons, and humming-birds. Unlike most tropical countries, it is thronged with singing-birds, having more than 20 species. Game birds are also abundant; and the fish is excellent and of great variety. Oysters are of fine quality; and in the Gulf of California pearl oysters are found, the fisheries yielding in pearls and shells some \$200,000 a year.

Agriculture.—This is backward in Mexico, from the ignorance and poverty of the peasants, and the scantiness of transportation and lack of improved machinery, but the government labors assiduously to encourage it, by distributing pamphlets, seeds, plants, etc., especially vines, olive and fruit trees, cork oaks, flax and fodder plants, mulberry trees and silkworms; and by extending irrigation works. In 1900 299,280 square miles, or two fifths the entire surface, was uncultivated. This of course is largely made up of the vast sandy deserts of the north

—the Bolson de Mapimi is a rocky wilderness of 50,000 square miles, in Coahuila and adjoining states. Even so, much more is possible. The different climatic levels give a wonderful range of production, from the cereals and cattle of the northern regions, and the coffee of the temperate, to the cacao and sugar of the tropics. On the high lands are raised corn (over 100,000,000 bushels in 1900), barley, and wheat, the favorite Mexican *frijoles* or beans (12,314,400 bushels), large quantities of sweet and some common potatoes. On the plain of Apam grows the maguey (century plant), from which the celebrated Mexican *pulque* and its distilled product *mescal* are made, also yielding a fibre useful for soap, and razor strops. Coffee is cultivated widely, the centre of production being Vera Cruz, and the best brands esteemed equal to Mocha; the crop in 1900 was 46,393,870 pounds, valued at \$6,048,500. Cacao, predominantly in Tabasco, 4,371,374 pounds, value \$1,709,800; tobacco (do.), 20,555,830, value \$2,431,100; vanilla, chiefly in Vera Cruz, 32,798 pounds, value \$472,670. Sugarcane (see *Manufactures*) yields 40 to 60 tons an acre. A coarse-stapled cotton is extensively grown in Durango and Coahuila, from 50,000,000 to 100,000,000 pounds annually. But next to corn, the most valuable production is that of fibre, from several varieties of agave. The chief is henequen or sisal hemp, valued for cables from its resistance to wet; product in 1900, 85,860 tons, value \$18,262,800. Of ixtle or istle (*piña*, silk grass), for cordage, hammocks, bagging, etc., the product was 8,305 tons, value \$808,600. Rice and some indigo are also raised. The northern states are immense cattle ranges; and in 1899 about 3,000,000 of beef cattle, sheep, swine, and goats were slaughtered, valued at about \$46,000,000.

Manufactures.—President Diaz has endeavored to develop Mexican industries by high tariffs on all manufactured articles; but so far there is little beyond manufacture for local needs. The most important branch is that of goods from unbleached cotton or *manta*, which utilized in 1896 53,273,397 pounds of cotton, and employs 50,000 families in field or mill. There were in 1898 125 cotton mills, employing 23,731 hands, and turning out over 10,000,000 pieces of cloth and 4,000,000 pounds of yarn, the latter much used in shawls and *rebozos* or scarfs. Next is the woolen manufacture, largely a hand-loom business, but with two or three dozen mills; this is predominantly of the *zarape*, used by millions of Mexicans as a cloak by day and a blanket by night; but also of mixed cotton and wool blankets, knit underwear, carpets, and other articles. The silk industry is slight but growing, and there are a few paper mills. The third most considerable manufacture, however, is that of coarse pottery, carried on by local potters in every town, and in great variety of colors, glazes, etc. The sugar manufacture is growing; in 1900 it produced 73,554 tons of refined and 65,689 of muscovado sugar, and 51,770 hogsheds of molasses. A large distillation of rum from the molasses is carried on, as well as of *mescal* and *tequila* from pulque; there were over 2,000 distilleries. Nearly every town has a cigarette factory, and some have also cigar factories, and some 15,000,000 pounds of tobacco a year is thus employed, which does not supply the local demand. There is a small iron manu-

GENERAL BERNARDO REYES

MEXICO

facture of household and agricultural implements; in Leon a considerable manufacture of hardware and cutlery; and in the City of Mexico is a government cannon foundry and arsenal. A little glass is made. Leather work is widely spread, centring in Leon; felt hats are made in the chief cities, straw hats in all; hammocks largely, especially in Yucatan; silver is wrought in all parts. There is a large widely scattered manufacture of chocolate and confectionery; cottonseed-oil mills are numerous.

Commerce and Transportation.—Mexico has few good harbors on the Atlantic; but on the Pacific coast are the matchless ones of Guaymas, Acapulco, Manzanillo, and San Blas, and several others. The foreign commerce, chiefly with the United States and Europe, centres at Vera Cruz and Tampico on the Atlantic side. This amounted in 1900 to imports of \$130,944,800, and exports of \$148,659,000. Of the imports, about half were from the United States, one sixth from Great Britain, one ninth each from France and Germany; of the exports, four fifths to the United States, and one twelfth to Great Britain, much less to any other nation. Over \$60,000,000 overland trade by rail was done. The chief exports were silver ingots, coin, and ore (together two fifths of the whole), sisal hemp (one sixth), gold, timber, coffee, cattle, hides, tobacco, vanilla, and cacao. The vessels entering its ports average about 10,000 a year, with a gross tonnage of five to seven millions; about 1,500 are American and 800 British. Its own merchant marine is 17 steamers of 3,601 gross tons, and about 50 sailing vessels of 8,500. The railway system dates only from 1873, when the first road—from the capital to Vera Cruz, 263 miles, with immensely steep gradients—was opened; but it has now over 10,000 miles of main track, well distributed across the country, extremely plentiful in the centre, and with long branches into the mining regions. The chief lines are the Mexican, Mexican Central, Mexican National, Great Eastern, International, Inter-oceanic, Mexican Northern, and Mexican Southern.

Government.—The country is a federal republic modeled on the United States, its states being internally supreme. The separation of executive, legislative, and judicial powers is maintained as with us. The constitution is of 5 Feb. 1857; but the amendments of 25 Sept. 1873 (under Lerdo, after Juarez's death) are of capital importance. These definitively separate church and state, forbid Congress to establish or hamper any religion or establish monastic orders on any pretext, constitute marriage a civil contract, and substitute affirmation for religious oath. The executive is a President elected by popular vote (through electors, mere registrars as with us) for four years; by constitutional amendment of 20 Dec. 1890 he may be consecutively re-elected indefinitely. He is inaugurated the first of December following his election. There is no Vice-President; temporary absences or disabilities are filled by the secretary of state; for permanent ones Congress elects a provisional President till an election can be held. He has a cabinet of seven—Foreign Affairs (State); Interior; Justice and Public Instruction; *Fomento* (Patronage) of Industry and Colonization; Communications and Public Works; Finance and Public Credit; War and

Marine. The legislative body is composed of a Senate and a Chamber of Deputies. The Senate is composed of two Senators (each with an alternate) from each state, and the federal district, indirectly elected; the term is four years, and half of them are chosen every two. The Deputies are indirectly elected, one for every 40,000 inhabitants or fraction over 20,000; term two years; each has an alternate. There are two sessions of Congress each year: a spring one, 1 April to 31 May (specially continuable 15 days longer), to audit accounts and make appropriations; a second 16 Sept. (the national holiday) to 15 Dec., continuable 30 days longer, for general business. The judiciary is a Supreme Court of Justice, with district and circuit courts. The former consists of a chief justice and 11 associates, four alternates, an attorney-general, and a public prosecutor; they are elected for six years by indirect popular vote. There are three circuit and 32 district courts. The state governments are much like the national in organization, save that in general the legislature has but one chamber, and the governor is elected for four years. The states are divided into districts governed by prefects; the towns have councils called *ayuntamientos*. Despite the reserved rights of the states, the mining and commercial legislation was unified in 1883.

Army.—In 1900 this had 2,068 officers and 30,075 men; 22,605 infantry, 5,494 cavalry, 2,161 artillery, 128 engineer corps, 1,755 other services. The infantry have the Mauser rifle, the cavalry the Mauser carbine, the artillery the Bange field gun and mountain batteries. On a war footing, the army is designed to have 120,000 infantry, 20,000 cavalry, and 6,000 artillery. The navy consists of two first-class and two second-class screw gunboats of 1,750 total tonnage, a transport ship, two despatch boats, a corvette, and a training ship; it has 90 officers and 500 men.

Finances.—The total revenue is about \$65,000,000 a year; the expenditures are estimated in budgets and held close to it. The interest on debt, army and navy, and public works, are the chief items of expenditure. The foreign debt is \$224,796,600, funded at 5 per cent in 1899; redeemable through a sinking fund not later than 1945, and secured on national customs and export dues. The internal debt is \$121,824,750. There is a very small floating debt. The state revenues aggregate about \$20,000,000, and the municipal \$16,500,000.

Education.—The system has been revolutionized, or it may be said created, within a quarter of a century—that is, since President Diaz's accession. There is a great non-sectarian public-school system, supported by the national and state governments; primary education is nearly everywhere compulsory. The schools are divided into primary elementary, primary superior, and preparatory (professional and technical); the latter, for higher education, are found in the leading cities. In the federal district and the territories, the system is under the direct control of the executive. Churches and private associations also support many schools. The federal government likewise supports normal schools, schools of jurisprudence, commerce and administration, agriculture, veterinary, science, fine arts, and arts and trades for both sexes; a national conservatory of music, school

MEXICO

for the blind and mutes, reform schools, etc., besides museums and 17 libraries, the largest with over 150,000 volumes. There were over 12,500 schools in 1902, about half of the government schools, the latter having some 16,000 teachers and 700,000 pupils enrolled. Of the adults, about half can read and write, and three or four hundred thousand more can read.

Religion.—All but an inappreciable fraction of the inhabitants are Roman Catholics. There are about 50,000 Protestants, a few Mormons, etc.

History.—For the native states before the Spanish conquest, see AZTEC CONFEDERACY. Its savage disunion, and the lack of any common interest in combining to resist the foreigners merely to be worse treated by their fellows, enabled the Spaniards to utilize one faction against the others, and by their superior armor and intellectual resource quell them one by one; and after coming near extermination, the Spanish forces under Cortes stormed the last quarter of Tenochtitlan on the 13th of August 1521, and captured the last war chief, Guatemozin. The land was politically turned into the province of New Spain, and for a short generation was governed by *audiencias* or courts of inquiry; this failing utterly, it became a viceroyalty, and 64 viceroys ruled over it first and last,—the first, Antonio Mendoza, beginning in 1535; the last, Don Juan O'Donoju, quitting the country in 1821, on the success of the revolution.

The method of disposing of the natives was to make them slaves, except the caciques, and share them between the conquerors, the settlers who speedily flocked in, and the Crown officials; and the owners interbred with them as the Southern planters did with the negroes, as well as contracting legitimate marriages with the widows or daughters of the caciques, creating the great half-breed element so prominent in Spanish-American history. This slave system was called *repartimiento*—"apportionment" to labor on farms, or in mines. The result, though not total extermination as in Haiti, was of such atrocity and diminution of native numbers that some of the clergy, headed by the immortal Las Casas, championed their cause, and succeeded in having the system abolished and replaced by *encomienda* or predial serfdom. Here the immediate treatment of the serf might be little better or his security from outrage greater, but he had a right to stay on his plot of ground and not be sold or removed like an ox. Even this was wretched degradation; and Charles III., in the 18th century swept away this system in turn. The native was now a direct subject of the king, to whom he paid tribute, and had no master above him; but he was still a ward of the white society, and to protect him from the rapacity of the greedier among them, he was declared incapable of business transactions above the value of five piastres—which did not prevent the evil aimed at. The caciques, however, were exempt from pupilage; and so were the half-breeds.

The treatment of the white colonists was the same as in all Spanish America; the government—which wished the colonies to be mere reservoirs of raw materials for the mother country, repressing their industries and forbidding competition with the home country even in products of the earth—could not carry out its policy if the colonists were allowed to have any voice in the administration, as they would not vote to keep their own countries ruined. It

therefore absolutely excluded any one born in the colonies, even of the purest Spanish blood, the highest wealth and position, or even titles of nobility, from any share in the administration, except membership in the *ayuntamientos* or town councils. Of the 64 viceroys, only one, Don Juan de Acuña (1722-34), was a native. All the government places, all the church livings, and most of the favorable chances and concessions in mining and plantations and commerce, were monopolized by the small number of Spaniards born in Spain, who, under the officials, formed a caste despising the "creole" Spaniards even with no admixture of Indian blood, who were considered as aliens, as in fact they were.

This could only endure while the home government kept its military power and prestige unbroken; and in 1808 Napoleon shattered it. Spain for a time was blotted out; at last the royal family were treacherously seized and retained in captivity, and shortly the Mexicans found themselves compelled to decide which of three incompatible sovereignties, the strongest of them not obeyed much out of reach, should have their obedience—the captive king, the usurper Joseph Bonaparte, or the revolutionary junta. Freed from the fear of home intervention, the creoles rose against the politico-ecclesiastical oligarchy above them; in 1810 the revolt broke out at Guanajuato, under the priest Don Miguel Hidalgo. He was defeated, captured, and executed in 1811; another priest, Morelos, took his place and in 1815 shared his fate, after having in 1813 proclaimed the independence of Mexico. Year after year the guerrilla war dragged on: there was no reason why it should close, for there was as much profit in soldiering and levying contributions as in the wretched life of a peasant, and much more satisfaction. At last the superior resources of the upper class had nearly worn out the revolution, and only one leader was left in the field, the half-breed Guerrero; when the revolution of 1820 in Spain, and the evident willingness of Ferdinand VII. to turn Liberal (in promises) to keep his crown, alarmed the clergy and the oligarchy for fear of having liberalism and republicanism introduced through the very channels of the sacred majesty. They therefore persuaded Don Agustín Iturbide—a creole who had for years been a general against the revolutionists, till he was dismissed because the Spaniards suspected the natives—to return to public life, and set up an independent reactionary monarchy. Iturbide secretly made terms with Guerrero, and on 24 Feb. 1821 proclaimed the "plan of Iguala" (a small Mexican town), for an independent limited monarchy under Ferdinand or a Bourbon prince, with equal rights for Spaniards and Mexicans, and the recognition of the Roman Catholic religion and guarantee of clerical privileges. This was no very formidable liberalism, but the monopolists would not endure it. The viceroy Apodaca sent a force against Iturbide, but public opinion declared for him everywhere; Apodaca was deposed; the new viceroy, O'Donoju, could get no farther than Vera Cruz, where he landed, and made a treaty with Iturbide, recognizing Mexican independence under Ferdinand or a Bourbon prince, and in case of their refusal, any one the Mexicans chose. O'Donoju shortly died, and the home government repudiated his

MEXICO

arrangement. Meantime Iturbide had been made president of the regency. The first Mexican Congress met 24 Feb. 1822, the party of the independent monarchy with a Bourbon prince was destroyed by the flat refusal of Spain to consent, and the majority who preferred a republic were overborne by Iturbide, who induced or coerced the Congress into electing him emperor, he being crowned 21 July 1822. But there were speedy quarrels between him and Congress; Santa Anna, captain-general of Vera Cruz, who was to play so large a part in Mexican affairs for more than a quarter century to come, proclaimed a republic. Iturbide sent forces against him, but they deserted to the enemy; in despair he re-convened the Congress he had arbitrarily dissolved four months before, and abdicated, 19 April 1823. They refused to accept the abdication, declared the election void from the start, and deported him to Europe with a pension. Induced by his partisans to return a few months later, he was captured and shot.

A time of the utmost confusion and disorder ensued. The uppermost division was into Federalists and Centralizers; the latter represented the reactionaries, the former the State Rights party. The latter had the majority, and passed the constitution of 4 Oct. 1824, modeled on that of the United States, but with the most incongruous and destructive additions imaginable: the Roman Catholic religion was established, and, as in our Articles of Confederation, each state was to contribute its quota to the national revenue. As with us, coercion of the states meant civil war; no means were provided for assessing the quota, and the states had a perpetual pretext for secession. The creation of a federal district was another grievance. The finances were in chaos. After a welter of civil disorder, Guerrero was victorious in 1828. The Mexican navy attacked Spanish vessels near Cuba, under command of the American David Porter; Spain attempted to re-conquer Mexico, but was defeated at Tampico. Guerrero was shortly deposed by Bustamante, he in turn by Gomez Pedraza; who was succeeded by Gomez Farias (1833), who attacked the exemptions of the clergy, and was deposed by Santa Anna, who became dictator 31 May 1834. He dissolved Congress and the state legislatures, replaced the governors and municipal mayors with his partisans, and retired to private life. Following in his footsteps, a new Congress framed a new constitution, the "Seven Laws," on 30 Dec. 1836, and abolished the states altogether, substituting departments with governors appointed by the president, besides reducing the representation. This was the signal for the revolt of Texas, with the attempted re-conquest by Santa Anna, the massacre of the Alamo, and the defeat and capture of Santa Anna at San Jacinto. (See TEXAS.) Other revolts followed in the interior; and Bustamante was made provisional president. The French war of 1838 supervened, Vera Cruz was occupied, and the government had to yield. Sessions of states and risings in cities kept Bustamante's hands full; at last Santa Anna came forward to compose the strife, and on 28 Sept. 1841 issued a proclamation abolishing the Seven Laws, except as to the judiciary, and providing for a new Congress, whose appointment he was to have power to review. On 10 October he was made provisional president, and Bustamante was expelled. But the new Con-

gress was so refractory that Santa Anna gave up the task and left Nicolas Bravo in his place; who set up a new constitution in 1843, restoring the clerical and other privileges. Santa Anna still remained openly or secretly the real head of affairs till 6 Dec. 1844; then a mutiny in the capital was the signal for his expulsion, arrest and imprisonment.

The Mexican War (q.v.) of 1846-7 again brought him to the front; its history is also a part of United States history, and need not be detailed here; at its close, Santa Anna left the country. The revolution of February 1853 recalled him; on 20 April he resumed the executive power; and on 21 December a Congress of his own choosing made him president for life, with the title of Most Serene Highness and the power of nominating his successor. His administration was very useful, especially in creating the noted *Pomento*, or ministry to foster public works, education, and intellectual progress; but his despotism raised revolts everywhere among the Federalists—chiefly that of Ayutla, in March 1854, led by Gen. Juan Alvarez, and Ignacio Comonfort, in which Porfirio Diaz was a young soldier and consulted with Benito Juarez in prison. Santa Anna left the capital in August 1855, and a ministry was formed containing Comonfort as minister of war and Juarez as minister of justice. A constitution was proclaimed 5 Feb. 1857, which as amended is the present one of the republic. Comonfort became dictator 17 Dec. 1857. He was deposed and expelled; but the succession was not given to Juarez, who as chief justice of the supreme court had a right to it under the constitution, and he established a revolutionary government, and carried on civil war for years against several successors, the ablest of whom was Miguel Miramon. The latter held a large part of the interior; but Juarez held the chief ports, was recognized by the United States, and on 12 July 1859 issued a proclamation which not only supplied him with funds, but gave him the permanent headship of the radical movement. This disestablished the Church *in toto*, confiscated its property, established civil marriage and registration, and transferred legal cases theretofore tried in ecclesiastical courts to the civil ones.

But the outrages of both sides on foreign subjects and foreign property (Miramon was by far the worst, but his rival had to share the discredit), and Juarez's control of the ports which crippled foreign commerce caused a general talk of foreign intervention; and Miramon's seizure of the British Legation and confiscation of \$660,000 in coin under seal, intended for foreign bondholders, led to a treaty of joint intervention in October 1861. But the next year Great Britain and Spain withdrew because Louis Napoleon's plans were too far-reaching. The latter had revived the scheme of an independent Mexican monarchy; and after his troops entered the City of Mexico, 17 June 1863, his minister appointed a provisional government, and offered the crown to Maximilian of Austria, or if he refused it, left it to the choice of Louis Napoleon. Maximilian accepted, subject to the approval of the Mexican people in convention, and armed support from Louis Napoleon as long as needed; and Juarez prepared anew to prolong the fight. Maximilian's government was doomed from the first. It had

MEXICO

been invited and welcomed by the clerical and other conservative interests, and by a large class of planters and business men who were tired of revolution and dreaded radicalism, and simply wished orderly government. But Maximilian was too tolerant for his allies; the church party clamored for restoration of its confiscated property, the provisional government had already refused, and he could not comply; his foreign army was hated and his best measures shared the odium; he planned admirable reforms, but had no power to execute them and no staff to entrust them to; he tried to harmonize parties, and only alienated his supporters; he inflicted a heavy debt on the country, and spent great sums on pageantry to please elements powerless to uphold him. In 1865, however, his forces had nearly worn out Juarez; and on a false report of his having fled the country, Maximilian was induced by Bazaine to adopt a plan repeatedly tried by Mexican leaders, and proclaim all Juarists still in the field outlaws to be shot on capture. It was his own death warrant. The United States, now freed from the Civil War, considered a foreign sovereign in Mexico upheld by a foreign army an infraction of the Monroe Doctrine; Mr. Seward persistently pressed on Louis Napoleon the withdrawal of the troops, and the latter finally promised to do so by November 1867. Maximilian would have abdicated, but his wife Carlotta dissuaded him: she believed in the assurances of their Mexican party, that they could reign as native sovereigns beloved by the people—and in truth, the high-minded couple did their best to that end. But the native opposition made rapid headway; Louis Napoleon withdrew the last French troops in February 1867; Carlotta appealed in vain to him and to the Pope, and went mad; Maximilian wished again to abdicate, his supporters refused to accept it, and persuaded him to stay; he was captured, and on 19 June shot, with the Mexican generals Miramon and Mexia, a request from the United States that his life be spared being courteously and for very weighty reasons denied. Diaz, now Juarez's chief commander, captured Mexico City, and Juarez entered the capital 15 July; and on 12 October was elected president.

With rare moderation, Juarez, though a full-blooded Indian, abstained from the usual policy of revenge which had kept the seeds of rebellion nourished in blood; and set to work to inaugurate a policy of internal peace and development. He devised the system of railway and telegraph lines, promoted public works, and started the country on the path where his greater successor has kept it. The other leaders, however, objected to re-electing him in 1871, since, he having been really president for a decade, they thought it time for a rotation; he was elected, but a rebellion was headed by Diaz, and ended only by Juarez's death 18 July 1872. The chief justice of the supreme court, Lerdo de Tejada, succeeded *ad interim* according to the constitution as then; was elected president, and took his seat 1 Dec. 1872. He ruled peacefully and ably till early in 1876, carrying on Juarez's policy, when a rebellion broke out; Diaz, though not its author, joined it, drove Lerdo into exile, became provisional president, and on 6 May 1877 was proclaimed by Congress constitutional president for the term ending 1880. At that time he was succeeded in peaceable fashion by Manuel Gonzalez; in 1884 he was again elected, and

since then has been re-elected regularly, at first under suspensions of the constitution, but since 1890 by an amendment which has abolished the constitutional restrictions. His administrations have been among the greatest constructive feats of statesmanship in modern history; their triumph has been the placing of Mexico among the stable and respected nations of the world, and under his ægis the Mexican Liberal party, a permanent and great political organization, while supporting him, is (1903) carefully preparing for future eventualities, so that there shall be no military pretenders, or foolish and destructive revolutions, when in the natural course of events the strong hand of Diaz ceases to hold the helm of state.

Revised by M. DE AZPIROZ,
Mexican Ambassador to United States.

Mexico, a state of the United States of Mexico; in the southeast; bounded by the state of Hidalgo on the north; on the east by Tlaxcala and Puebla, on the south of Morelos and Guerrero, and on the west by Michoacan and Queretaro. The federal district is bounded on the north, east, and west by the state of Mexico. The area is 9,247 square miles. Several high mountain peaks are among the mountain ranges which cross the southern and eastern parts of the state, chief of which are volcanoes of the Popocatepeti Range, about 17,000 feet in height, and the peaks of the Ajusco Range, about 13,600 feet. Some of the elevations in the interior are about 14,000 feet in height. There are a number of beautiful small lakes, but only a few rivers, all small. On the fertile valley lands are raised coffee, spices, tobacco, sugar, and wheat, and on the grazing lands of the mountain slopes much attention is given to stock-raising. The state is rich in valuable minerals, but the mines are practically undeveloped. Manufacturing is increasing; the chief manufactures are wine, flour, glass, pottery, and some cotton and woolen goods. The capital is Toluca (q.v.). Railroads connect the principal towns with the City of Mexico. Pop. 845,213.

Mexico, Mo., city, county-seat of Audrain County; on Salt River, and on the Wabash and the Chicago & Alton R.R.'s; about 115 miles northwest of Saint Louis. Mexico was settled in 1833 and in 1852 was incorporated. It is in an agricultural section, the chief products of which are wheat and corn. Considerable attention is given to the raising of cattle and horses. The manufactures are dressed marble, wagons, plows, flour, stove lining, fire-brick, and foundry products. Mexico is the seat of the Missouri Military Academy, and of the Hardin College for Women, founded in 1873 under the auspices of the Baptists. The charter under which the government is administered was granted in 1893, and provided for a mayor who holds office two years, and a council. Pop. (1890) 4,789; (1900) 5,099.

México, Philippines, a pueblo of the province of Pampanga, Luzon, on a branch of the Pampanga delta, 6 miles northeast of Bacolor. Pop. 17,100.

Mexico, City of, capital of the Republic of Mexico and chief city of the Federal District, is situated in lat. 19° 26' 5" N., lon. 99° 6' 45" west from Greenwich, at an altitude of

MEXICO

7,434 feet above the level of the sea, near the centre of the Valley of Mexico. This is a marshy table-land, about 60 miles long, 30 miles wide and enclosed at all points by high mountains. The climate of the city is mild. The temperature ranges from 35° to 90° F., but it seldom falls below 60° or rises above 80° (in the shade), the mean being between 60° and 70°. The nights and mornings are cool throughout the year, the hottest months being April and May. There are two seasons, the dry and the rainy, the latter extending from May to September. But even then the day is bright sunshine, except for a short brisk afternoon shower.

Topography and Streets.—It has an area of more than 20 square miles. Its population (census of 1900) was nearly 370,000. It is the largest and finest city of Latin America; at the beginning of the 19th century the largest city in the Western hemisphere, "the handsomest capital in America," said Humboldt at that time. It is the political, the commercial, the educational centre of the republic, indeed the centre of every line of national activity. It is to Mexico, it has been said, what Paris is to France. It is distant by rail from: Vera Cruz, on the Gulf of Mexico, 263 miles; Acapulco, on the Pacific, 290 miles; El Paso, Texas, 1,224 miles. Its streets, of which with lanes there are more than 900, are straight, extending from north to south, and east to west, and intersecting at right angles. The city is growing chiefly toward the northwest, but in this new section, the streets are not laid out as regularly as in the old. The principal ones are broad, well paved with asphalt, well kept, and bordered with good sidewalks. Square, flat-roofed buildings of two or three stories, built round a *patio* (court yard) open to the sky, line the streets. Their walls are thick, of stone or brick, and covered with stucco. The windows open on to neat little balconies. Some of the finest buildings are faced with porcelain tiles of different colors, arranged in beautiful patterns; their patios being adorned with pretty gardens, fountains, and statuary. Owing to the marshy soil none of the buildings have cellars, and because of the possibility of earthquakes and the mildness of the climate all, in the old part of the city at least, have no chimneys. For cooking, charcoal is used in *braseros* (brick stoves). The street nomenclature is peculiar. A continuous line of street generally has a different name at every block. In 1889 the streets were re-named. All extending east and west were named *avenidas*; all north and south *calles* (streets), one name being given to a continuous thoroughfare. But the people, especially the uneducated classes, clung so tenaciously to the old names that the authorities yielded and the former names were restored. There is no exclusively residential section, one of the handsomest residences often being found between two business houses in the heart of the city. The principal business street is named Los Plateros (the silversmiths) for two blocks, and San Francisco for the next three. It is also one of the most fashionable streets. Next in importance to Los Plateros is Calle Cinco de Mayo (Street of 5th of May), the name commemorating the repulse of the French by the Mexicans at Puebla in 1862. Both these streets start from the main square. Some of the streets are named for distinguished men of Mexican history. Others have religious names, taken

from names of churches situated thereon, as Street of Holy Ghost, Jesus, Sanctified Virgin, and the like. Still others have very odd names, as Lost Child, Sorrow, Sad Indian. The street car service, owned and operated by English capitalists, is excellent. A system of electric traction covers the entire city and connects all the suburban towns. In 1902 these lines carried 30,000,000 passengers. Hearses are almost unknown, special street cars being used to convey to the cemetery both the dead and mourners.

Parks and Public Buildings.—The principal square is the Plaza Mayor de la Constitucion, situated in the centre of the city. It covers 14 acres, but is only part of the ground enclosed by the walls of the *teocalli* (temple) of the ancient Aztec city. Its centre is occupied by a park named the Zocalo. The entire eastern side of the plaza is bounded by the National Palace, which is said to occupy the site of Montezuma's palace. The present building was begun in 1692 and has been added to from time to time till now it has a frontage of nearly 700 feet. It is two stories high and architecturally the least attractive public building in the city, being long, low, and monotonously plain. Originally it was the residence of the rulers of Mexico, but for many years has been devoted to housing some of the executive departments of the national government, including the President's offices. The federal senate meets here temporarily until the magnificent federal capitol, which it is proposed to build, shall have been erected. On the second floor and extending the length of nearly the entire front is the Hall of Ambassadors, with its walls hung with portraits of Mexican rulers since independence was won, besides a full-length likeness of Washington. Over the main entrance hangs the Liberty Bell, with which, in his church at Dolores, the father of Mexican independence, the priest Hidalgo, called his people to arms on the night of 15 Sept. 1810. It was moved to its present location in 1896, and since, a feature of every celebration of the anniversary of the declaration of independence is the ringing of this bell at midnight by the President. On the north side of the Plaza Mayor is the cathedral, the city's chief architectural feature, its most majestic, most imposing edifice. It occupies a part of the ground enclosed by the walls of the ancient Aztec temple. It covers a greater area than any other church in the Western hemisphere, and is surpassed in this respect by only two in the whole world—St. Peter's at Rome and the Spanish cathedral at Seville. The walls are gray stone. From the sides of the façade rise two bell towers. The whole pile is crowned by a central tower which commands a superb view of the city and the surrounding valley. It was begun in the last half of the 16th century and more than two centuries elapsed before it was entirely finished. Altogether, both outside and in, it has cost many millions. The railing of the choir is made of a composite of gold, silver, and copper and is said to have cost \$1,500,000. The interior contains also some exquisite wood carving and some excellent paintings, the best being one by Murillo, in the chapter-house. In this cathedral in 1822 Agustín Iturbide was crowned Emperor of Mexico, and here he is buried, his coffin bearing simply these words: "The Liberator." Here too in 1864 the Austrian archduke Maximilian and his wife

MEXICO

Carlotta were crowned emperor and empress of Mexico. Other churches especially noteworthy are Profesa, one of the most beautiful; Santo Domingo, one of the largest; San Hipolito, and San Francisco, the most interesting historically. In the latter of the last two Cortes worshipped and for many years lay buried. Here Iturbide attended the celebration of Mexican independence and here was held his funeral.

To the rear of the National Palace is the National Museum, containing a large and very valuable collection of Mexican antiquities, as well as many treasures identified with the nation's history from the earliest down to recent times. Some of the most valuable archaeological remains have been found a few feet below the surface while excavating within the grounds which were once enclosed by the walls of the Aztec temple. The most important of these treasures are the Sacrificial Stone, the Aztec Idol of War and Death, and the Stone of the Sun. The last is often erroneously called the Calendar Stone; the archaeologist, A. F. Bandler, says it was undoubtedly used for sacrificial purposes. Besides these there is an almost endless array of small stone specimens, as well as tools, arms, weapons, picture-writing and feather work. In the section of national history is the banner borne by Hidalgo during his struggle for the independence of the colony, the standard belonging to Cortes, and carried through the period of the Conquest, and Maximilian's silver table-service and coach of state.

Near the National Palace is the National Academy and School of the Fine Arts, founded in 1778. It attracted the favorable notice of Humboldt during the year he spent in the city at the beginning of the 19th century. Its collection of casts, he said, was better than any to be found in Germany. It contains paintings ascribed to Murillo, Rubens, Velasquez, Leonardo, but its greatest work, the one pronounced by distinguished art critics one of the great paintings of the world, represents the Spanish priest and historian, Las Casas, protecting the Aztecs. It is the work of a native artist and received the first prize in the Academy of Rome. The Academy receives from the government an annual allowance of \$35,000. A large part of this sum is spent in prizes. The one which is most eagerly competed for being the one which enables the recipient to study art in Italy—a prize of \$600 a year for six successive years. In the day and night school connected with the Academy the tuition is free.

The National Library is housed in a fine building, once the Church of Saint Augustin, which like other religious foundations, in 1859 when the Laws of Reform took effect, became the property of the state. Portrait busts of distinguished Mexicans ornament the fence enclosing the gardens at the sides. Along the walls of the interior are ranged statues of the greatest men in literature of all times and places. The library contains more than 225,000 volumes. When the monasteries were suppressed, their libraries were gathered here and the collection therefore is especially rich in ecclesiastical literature. In 1537 the first book printed in the New World was printed in the City of Mexico on a printing-press brought from Spain. Its title: 'Escala Espiritual para Llegar al Cielo' (Spiritual Ladder for Reaching Heaven). No copy of

this work remains, the oldest work extant being a history of Tenochtitlan (Mexico) published in 1543. In this city was printed the first music printed in the New World, the first engravings from wood, the first newspaper, 'Mercurio Volante' (Flying Mercury), and antedating the first paper in the American colonies by more than ten years. Besides the National there are several small libraries with collections ranging in size from 7,000 to 14,000 volumes. The national archives are stored in the National Palace.

The largest and most beautiful park and public garden is the Alameda, situated about half a mile west of the Plaza Mayor, and bounded on the south by the Avenida Juarez. It covers about 40 acres, which include the lot wherein the victims of the Inquisition were burned. It is intersected by pleasant walks, shaded by fine trees, adorned with flower beds, flowering shrubs, and fountains. Concerts, attended by all classes, are given here every Sunday afternoon. A very short distance from the Alameda, the Avenida Juarez opens into the Paseo de la Reforma, one of the most beautiful avenues in the world. It was designed by Maximilian, who named it the Boulevard Emperiale. It is the fashionable afternoon drive and promenade. Broad at first, it has recently been enlarged to twice its original width. It is over two miles long and is lined on each side by double rows of lofty trees, beneath which are foot-ways and at their sides stone benches. Starting at the equestrian statue of Charles IV. of Spain it expands at regular intervals into *glorietas* (circles), some of which are adorned with monuments of the greatest men in Mexican history. This statue of Charles IV. is one of the city's finest works of art. Humboldt said that next to the equestrian statue of Marcus Aurelius at Rome, it was the best work of its kind in the world. It was made in Mexico at the beginning of the 19th century, it being the first important piece of bronze cast in America. At another circle is a statue of Columbus, and still further on one of Guatemotzin, the last of the Aztec kings.

The Paseo extends to the gates of Chapultepec, a rocky height rising abruptly from the level of the surrounding plain. A beautiful park, set with gigantic cypresses, which are said to antedate the Spanish Conquest, encircles the base of the rock. A palace crowns the hill, a part of which is occupied as the summer home of the President, the rest being used by the National Military Academy. Back of the hill is the battle field of Molino del Rey. The view from the front is regarded one of the most beautiful in the whole world,—the long vista of the Paseo de la Reforma to the city, standing in the centre of the valley, encircled by high mountains from which rise the snow-capped peaks, Ixtaccihuatl and Popocatepetl, 16,060 and 17,782 feet respectively above the level of the sea. In the park at the base of the rock there is a monument to the Mexican cadets who fell in 1847 while defending the hill from the assault of the American army. As evidence of the mutually good feeling existing between the local population and the American residents, on each American Memorial Day, the latter place flowers on this monument while the former do the same to the graves in the cemetery of the American soldiers who died during the American invasion.

MEXICO

The chief suburbs are: Tacubaya, San Angel, Coyoacan, Popotla, Guadalupe, and the towns along the line of the Vega Canal. All are within a radius of eight miles of the centre of the city. The Vega Canal is about eight miles long and connects the city with lakes Xochimilco and Chalco. From the gardens along this waterway come the flat-bottomed boats loaded with vegetables, fruits, and flowers for the city market. On Sundays and feast-days it often presents a very lively and picturesque sight, covered with boat-loads of people on their way to the picnic grounds of Santa Anita, a little Indian village of straw-thatched huts. Surrounding it are the *chinampas* (floating gardens). That they once floated is doubtful; at all events they are stationary now and are mere patches of marshy ground intersected by narrow channels, and used as market gardens. At Ixtacalco are other floating gardens. A road, the Paseo de la Vega, borders one side of the canal. Guadalupe contains the shrine of the Virgin of Guadalupe, the patron saint of Mexico. Here the treaty of peace, following the war of 1847 with the United States, was signed. At Popotla is the famous tree, *L'Arbol de la Noche Triste* (the tree of the dismal night), beneath which Cortes is said to have sat and wept the night of 1 July 1520, after his expulsion from the city. Coyoacan is even older than the City of Mexico. Cortes made it the seat of government while he superintended the rebuilding of the conquered city. The house in which he lived is still standing. San Angel is a beautiful little town, well known, too, for its excellent fruits, flowers, and vegetables. At Tacubaya is the national astronomical observatory. It contains also many very pretty houses where the wealthy residents of the capital pass the summer.

Commerce and Industry.—The city is the commercial and industrial centre of the republic. It possesses several wealthy banking institutions, the largest being the National Bank of Mexico with a capital of \$20,000,000.

It had in 1903 several hundred factories, including corn, flour, paper, and coffee mills; iron and type foundries; manufactories of cigars, hats, furniture, glass, pottery, rope, wire, starch, glue, soap, musical instruments, and many others. Dun's Agency for February 1903, states that dry goods' dealers report that 60 per cent of the goods sold are of domestic manufacture.

Transportation.—The railways which centre in the City of Mexico are: The Mexican Central, which runs almost due north to El Paso, Texas, 1,224 miles; The Mexican, the first completed line in Mexico, extending to Vera Cruz, 203 miles; the Cuernavaca Division, extending to Cuernavaca, and Rio de las Balsas, with ultimate terminus at Acapulco, on the Pacific; the Interoceanic, extending to Vera Cruz; the National, extending to Laredo, Texas, 840 miles.

Municipal Administration.—The Palacio del Ayuntamiento (city hall) is situated at the south side of the Plaza Mayor. The present building dates from 1720. In its council chamber are portraits of all the governors of Mexico from Cortes. The government of the city from the beginning, for nearly 400 years, till the end of June 1903, had been vested in a city council, composed of aldermen, a mayor, and a governor of the Federal District. On 1 July the new law, creating a change in the form of government became operative. The Federal District, of which

the City of Mexico is the chief city, is now governed similarly to the District of Columbia, United States. The powers of government and administration are lodged with three federally appointed officials, namely, the governor of the District, the president of the superior board of health, and the director of public works. Besides the special powers belonging to each of these officials, the three may act together as one superior governing body. Each town within the Federal District continues to elect its own board of aldermen, but their powers now are restricted to those of advice, supervision, and veto. The board of each town may suggest measures to the three district commissioners for the benefit of its own constituents; it may see that measures adopted for its own constituents are properly carried out; it may suspend public works by a veto which can be annulled only by the President of Mexico, acting with the advice of his cabinet. Municipal affairs are excellently administered. The city is well policed. Over 500 unmounted policemen are always on duty, one being stationed at every corner. The street cleaning department keeps the streets in good condition. The city is lighted chiefly by electricity. The service includes 516 arc lights of 2,000 candle-power, 430 of 1,200 candle-power, and some 200 incandescent lights. Two lotteries exist, but other gambling concerns have been closed for more than a year.

The city issues licenses to 1,900 shops for the sale of wines, liquors, beers, and pulque. All *pulquerias* (pulque shops) are closed at six o'clock throughout the year. Drinking-places of all kinds by a new law are closed at noon Sunday and remained closed till Monday morning. This has resulted in reducing the number of Sunday arrests for crime to one third the former number. The providing an adequate water-supply has long been a problem to the municipality. President Diaz in his message at the opening of Congress, September 1903, states that the solution of the problem is in sight. At present the water comes from six different sources outside the city, which yield about 36,800 litres per minute, and from eleven public and 1,375 private artesian wells in the city, which yield about 22,000 litres per minute.

Public Works.—The city is situated at nearly the lowest point in the valley, and from the earliest times had always been in danger of inundation. There are six lakes (so called) within the valley, all of which, with the exception of Texcoco, are above the level of the city. In times of heavy rains their waters sometimes overflowed the banks and having no outlet through the surrounding mountains, found their way to Lake Texcoco which being only two or three feet below the level of the city, rose sufficiently to flood it. Before the Spanish Conquest and for some time afterward dikes were built about the city to keep the flood waters out, but these proved ineffective. Inundations occurred on an average once in 25 years. In 1608 the cut of Nochistongo was tunneled through the mountains, as an outlet for the flood waters of the highest lake in the valley which is 13 feet above the level of the city. But this work only partly relieved the situation. In 1629 there was another flood and the city was submerged to a depth of three feet for five years. This paralyzed business and caused great loss of life and property. The

MEXICO

Spanish government ordered the site of the city to be changed to higher ground. But presently, owing to a very dry season and to earthquakes, the waters passed away and the royal order was not carried out. The present canal and tunnel is the joint undertaking of the city and of the national government. It is designed to serve a twofold purpose: to control the waters of Lake Texcoco, thus removing all possibility of future inundations; to be a continuation of the city's sewerage system. It starts just east of the city, where it joins the network of city sewers. It extends to the mountains, a distance of 30 miles, connecting with Lake Texcoco, on its way. It pierces the mountains by a tunnel seven miles long, and beyond the mountains is continued as a canal for several miles. The canal was finished in 1896. The sewerage system is now (1903) nearly completed. The city can never again be inundated and it is now provided with an effective sewerage system of which from the very beginning of its existence it had been in the greatest need.

Finances.—In 1902, the municipal taxes yielded a revenue of \$6,500,000 (Mexican silver). The expenditures for the same period were \$4,000,000. In the list of taxes on personal property in 1902, 819 private carriages paid a monthly tax averaging about \$10 each; 4,015 bicycles, \$1 a month each; 2,700 carts and wagons an average monthly tax of \$5 each. In 1902 the licenses from 1,230 tobacco stores; 854 places where wines, liquors, and beers were sold; 972 pulquerias (pulque shops) yielded the city a monthly revenue of about \$65,000. Licenses from 61 pawnshops in 1902 yielded a revenue exceeding \$8,000 a month. The tax on tradesmen is proportioned to the volume of business. The tax on street peddlers and small booths is collected daily, the amount depending upon the stock on hand. Taxes as low as a few cents a day are collected. The water-tax yields a revenue (1903) of about \$250,000 annually. The tax on rents is about 12 per cent, houses unoccupied not being taxed at all. Among the municipal expenditures in 1902, were those for: water, which averaged about \$30,000 a month; street cleaning, about \$13,000 a month; lighting, about \$26,000 a month.

Population.—The native population embraces descendants of Spaniards, and of some other Europeans, Indians, and mixed races. The foreign population consists mostly of Spaniards, Americans, Germans, French, and English. In 1902 there were 6,000 American residents engaged in business. The great majority of these are in the employ of railroads and mining companies, or represent United States business houses. Almost all the shop-keepers are either French or Germans, a few are Spaniards, hardly any are Jews, and none at all Americans. The total population is 370,000.

Public Health.—The death rate has always been very high, sometimes reaching 50 per 1,000. This high rate has been owing: partly to the great infant mortality among the very poor, especially the peon class; partly to very defective drainage. With the completion of the excellent system of sewers the death rate will no doubt be greatly lowered. Referring to this matter, President Diaz, in his message at the opening of Congress, in September, 1903, stated that during the first half of: (1901) the deaths numbered 12,100; (1902) 10,442; (1903) 8,858.

Education.—The public school system of the country has its centre in the City of Mexico. The schools are divided into three grades, namely, primary, advanced primary, and national preparatory. Attendance at the first is compulsory. The work covers from four to six years and comprises chiefly the elementary studies. The second grade carries on the work of the first, and includes also French and the natural sciences. The national preparatory aims to prepare for the professional schools. The course of study extends through six years. The first two are devoted almost exclusively to the study of mathematics, French, and Spanish. The work of the remaining four years includes the literatures of Germany, Spain, and Mexico. Neither Latin nor Greek is taught in the public schools. These schools are supported both by the city and by the federal government.

Besides the public schools supported by the government there are also free primary schools maintained either by Roman Catholics or Protestants. There are also a great many private pay schools. Among the professional schools are those of law, medicine, theology, fine arts, music, and the applied sciences. All the professional schools are independent of each other. The friends of education in the city hope to see the national preparatory and the professional schools consolidated into a national university.

Newspapers.—There are 15 daily newspapers, of which the Mexican *Herald* is the only one in English. *El Imparcial* has the largest circulation of any newspaper in all Mexico. The official government organ is *Diario Oficial*.

Religion.—Roman Catholicism is the religion of all but a very small part of the population. There are 11 Protestant churches, including two Methodist, two Episcopal, two Presbyterian, one Baptist, one Christian Scientist. Nearly all these denominations maintain missions, both in the city and in other parts of the country. A Young Men's Christian Association has been formed and has a membership of 430, more than half of whom are Americans, the next numerically being Mexicans and English. A Women's Christian Temperance Union has also been lately organized. All these worthy undertakings receive the encouragement of President Diaz.

Charities.—There are a great many charitable institutions. Of these more than 20 are hospitals, the oldest being that of Jesus Nazareno, founded by Cortes. A general hospital, nearing completion (1903), is to consist of 60 separate buildings and will be one of the largest in the world. Besides these public hospitals, there are also several private ones, maintained by voluntary contributions. There are also asylums for the poor, insane, blind, and foundlings. A unique and very remarkable benefaction is the Monte de Piedad (Mountain of Mercy), the national pawnshop. It was founded in 1774, by a wealthy mine owner for the sole purpose of lending to the poor, on pledges, sums of money, at very low rates of interest, thus protecting them from the extortionate charges of private pawnbrokers. After a certain length of time the unredeemed pledges are sold, and when all expenses are paid the balance in each case is returned to the original owner.

Amusements.—Sunday is the day of all others for recreations and amusements. After the morning service at the churches the day is

MEXICO

given up to pleasures. First, the band concert in the Alameda; in the afternoon the bull fight; and the theatre in the evening. There is now but one bull ring in the city. It has a seating capacity of 15,000 and is sometimes crowded. The best performances are often given in honor of the President and are occasionally attended by him, as well as by others high in official life. The government has tried to abolish this sport, and laws have been passed to this end, only to be repealed, so strong have been the protests of the masses of the people against this action.

Pulque.—The national beverage of Mexico is pulque. It was in use at the time of Cortes and no one knows how long before. It is made of the fermented juice of the *agave Americana*, or century plant. One plant will often yield two gallons a day. Special pulque trains from the country arrive daily. Eighty thousand gallons are said to be consumed daily in the city alone.

History.—Of what often passes for the history of the city before the Spanish Conquest, and indeed, for many years after, it would be hard to tell how much is true, and how much false. But there is no doubt that it was founded by the Aztecs. It is generally accepted as true that they came from some unknown region in the Northwest, perhaps north of the Gulf of California, that for more than 100 years they wandered in the Mexican Valley, that they settled near the centre of the valley on islands of Lake Texcoco, in the early part of the 14th century. Tradition says they were directed by the oracle to settle where they had seen, perched on a cactus, an eagle devouring a snake. Hence the centre of the national coat-of-arms. The original name of the city was Tenochtitlan.

In the centre was the great *teocalli* (temple). The first rude houses, standing on piles, and built of mud and rushes, before the Spanish Conquest had been replaced by buildings of stone. The city had a radius of about half a mile; an area of about one quarter that of the present city. It was intersected by canals; hence sometimes called the Venice of the Western world. With the mainland it was connected by causeways. During the Spanish Conquest (1519–21) the Aztec city was completely destroyed, not a vestige of it remaining. No trustworthy record exists as to the size of the population at this time. One contemporary writer states that it was 500,000; another, 30,000. On the same site in 1522 Cortes began the building of the Spanish city. But so many changes have been made since then that the city of to-day retains hardly a trace of the city founded by Cortes. In 1600 its population consisted of 7,000 Spaniards and 8,000 Indians. In 1746 it had a population of 90,000; fifty years later one of 113,000.

For nearly 300 years it was the capital city of New Spain. Some of the viceroys were good men and able rulers and among other good deeds, did much to improve the condition of the city. Events, not already mentioned, especially noteworthy in the life of the city, were: the riot of 1602, provoked by a famine, and causing the loss of more than \$3,000,000 worth of property; the capture of the city by Agustín Iturbide and his triumphal entry 27 Sept. 1821, the date which marks the end of Spanish power in Mexico; Iturbide's election as emperor, 22 May 1822; the capture of the city in 1847 by

the Americans under Gen. Scott; the taking effect in 1859 of the Laws of Reform, and the consequent suppression of convents and monasteries, and the confiscation of church property; the capture of the city by the French, 9 June 1863; its capture 21 June 1867 by the Liberal army led by General Díaz; the return to the city nearly a month later of President Juárez. Since the beginning of President Díaz's second administration in 1884 the city has had a period of uninterrupted peace. His enlightened, liberal, and progressive policy has greatly improved not only the condition of the country but that of the city as well. It is becoming modernized and filled with new life.

ISAAC F. SMITH, M.A.

Mexico, Gulf of, an arm of the Atlantic Ocean, bounded on the north by the United States and on the south and west by Mexico. It is oval in form; its greatest length is from east to west, about 1,000 miles; from north to south, about 800 miles; area, about 700,000 square miles. It has a continuous coast-line of about 3,000 miles. Its maximum depth is about 12,715 feet, and within the basin, exclusive of the submerged coastal plain, the average depth is about 9,000 feet. In former ages the area of the Gulf was much greater than at present; it included the lower basin of the Mississippi, Florida, a large part of eastern and southeastern Mexico, and the basins of the northern rivers of South America. The outlet of the Gulf is on the east, between the peninsulas of Yucatan and Florida, a distance of 450 miles. At this outlet is the island of Cuba, which is separated from Florida by the Strait of Florida, 125 miles wide, and from Yucatan by the Yucatan Channel, 120 miles wide. The Yucatan Channel opens into the Caribbean Sea and the Florida Strait enters the Atlantic.

The temperature of the Gulf is from 8° to 9° higher than in the Atlantic in the same latitude. The temperature at the point of greatest depth is 39½°, or the same as the temperature at the greatest depth of the Yucatan Channel, although the maximum depth of the Gulf is about 5,943 feet more than that of the channel. The chief current is the Gulf Stream (q.v.) which enters the Gulf through the Yucatan Channel, circles the interior and passes out through Florida Strait. The winds are about as on other parts of the globe where north-equatorial conditions exist; the prevailing winds from the north blow from September to March, and from the south from March to September. The severe gales are in the winter. The northern part of the Gulf, from Mexico to Florida, is really a coastal plain averaging from 40 to 100 miles

MEYCAUAYAN — MEYER

wide. The basin off the Mexican coast sinks rapidly to the submarine plain, and a short distance from shore reaches the maximum depth. The Bay of Campeachy is the largest indentation. Other bays are Havana, on the coast of Cuba, Pensacola, Tampa, Mobile, and Galveston, on the United States coast, and Vera Cruz on the coast of Mexico. A number of small bays and lagoons are on the western coast. The principal islands are at the entrance of the Gulf; Cuba the largest, and north of Cuba, the Florida Keys, a group of coral islands. There are a number of small islands in the southeastern part of the Gulf, off the coast of Yucatan, and some in the Bay of Campeachy. The delta of the Mississippi consists of low, marshy islands. The principal rivers which flow into the Gulf are the Mississippi, the Colorado, Brazos, Sabine, Mobile, and the Appalachicola from the United States, the Rio Grande on the boundary between the United States and Mexico, the Rio Verde, and several short streams from Mexico. The chief cities on the coast are Havana, Florida Keys, Tampa, Mobile, Galveston, and Vera Cruz. New Orleans and Houston have direct ship communication with the Gulf, and Mexico City uses Vera Cruz as its port.

Meycauayan, mā-ē-kā-wā-yān', or **Maycauayan**, mā-ē-kā-wā-yān', a pueblo of the province of Bulacán, on the eastern outlet of the Pampanga delta, 13 miles southeast of Malolos. It is a station of the Manila and Dagupan railroad, at the point where this railroad crosses into the province of Bulacán. Pop. 8,200.

Meyer, mī'ēr, **Adolph**, American merchant and politician: b. New Orleans, La., 19 Oct. 1842. A student of the University of Virginia until 1862, he joined the Confederate army in that year and served until the end of the war on the staff of Gen. J. S. Williams. On his return to Louisiana he engaged in the cultivation of cotton and sugar, as well as in financial and commercial pursuits in New Orleans. He was elected colonel of the State National Guard in 1879 and in 1881 was appointed brigadier-general in command of the 1st brigade. He has served six terms in Congress from the 52d to the 57th as Democratic Representative of the 1st District of Louisiana.

Meyer, mī'ēr, **Eduard**, German historian: b. Hamburg 25 Jan. 1855. He was educated at the universities of Bonn and Leipsic, and after completing his studies spent one year in Constantinople. In 1879 he went to the University of Leipsic as *privat-docent*; in 1885 became professor of ancient history at Breslau, and in 1889 at Halle. He has written 'Geschichte der Alten Ägypter' (1877); 'Geschichte des Altertums' (1884-1902), his largest work; 'Forschungen zur Alten Geschichte' (1892-9); 'Untersuchungen zur Geschichte der Gracchen' (History of Greece) (1894); 'Wirtschaftliche Entwicklung des Altertums' (1895); and 'Die Entstehung des Judentums' (1896).

Meyer, **Heinrich August Wilhelm**, German biblical commentator: b. Gotha 10 Jan. 1800; d. Hanover 21 June 1873. He studied at Jena, was pastor at Harste, Hoyer, and Neustadt, and upon his retirement in 1848, settled in Hanover. He is remembered for his 'Commentaries on the New Testament,' begun 1832. Since his death this work has been continued by Weiss, Wendt, Beyschlag, and others. The English translation

in Clark's series is in 20 volumes (1873-82), and there is an American edition in 11 volumes (1884-8).

Meyer, **Johann Georg**, yō'hān gā'ōrg, commonly known as "Meyer von Bremen," German painter: b. Bremen 28 Oct. 1813; d. Berlin 4 Dec. 1886. In his twenty-first year he went to Düsseldorf and began his studies under Sohn and Schadow; in 1841 he opened a studio of his own but removed to Berlin as his fame increased (1853). While scenes from the Bible were first the subjects of his brush, he later turned his attention to incidents of popular life, especially among the Hessian peasantry, and finally to the portrayal of family life in its pathetic aspect. Such pictures as 'The Jubilee of a Hessian Pastor' (1843); 'Christmas Eve'; 'Blindman's Buff'; 'The Soldier's Return'; 'The Inundation' (1846); 'The Repentant Daughter' (1852, in the gallery at Bremen), are full of intense sympathy with the homely 'annals of the poor.' After taking up his residence at Berlin, he chose especially scenes from child life, which he rendered with spirited humor. Among his pictures of this kind are 'The Fairy Tale'; 'Children Playing Blindman's Buff'; 'Grandfather and Grandchild'; etc. A third group of his pictures includes those of young women, as single figures or in groups. Such are 'The Tryst'; 'The Love Letter.' All his works are distinguished by true human feeling, truthfulness and thoroughness of execution.

Meyer, **Joseph**, German publisher: b. Gotha 9 May 1796; d. 27 June 1856. He organized various industrial undertakings, founded a publishing business at Gotha, which soon attained large proportions, was removed by him to Hildburghausen (1828), and in 1874 was transferred to Leipsic. The best-known of his publications is the 'Meyers Konversationslexikon,' the rival of Brockhaus in the encyclopædia field, which has been brought down to date by constant revisions and supplements. He published also a series of the German classics, a 'Historical Library,' and a 'Library of Natural Philosophy.'

Meyer, **Klaus**, German painter: b. Linden, Hanover, 20 Nov. 1856. He entered the Art School at Nuremberg in 1875, studied there 12 months, and subsequently became a pupil of Wagner and Löffitz at Munich. The result of their teaching, added to a patient study of the Dutch masters of the 17th century, appeared in the delicacy, vivid characterization and refined coloring of his work, which won him a place among the first of living Dutch painters. These qualities are exhibited in a Dutch interior produced by him (1882) in which are two figures in the costume of the 17th century. This work recalls the finest creations of Pieter de Hoogh (q.v.), and Van der Meer von Delft (q.v.), although Meyer prefers an atmosphere of cool silver tone to the warm golden lights of those masters. Another interior, a Beguin monastery scene (1883) won for him the grand gold medal at the International Art Exhibition at Munich. He painted many pictures in a similar vein, such as 'The Monastery School'; 'The Singing Nuns'; 'Old and Young Cats' (in the Dresden Gallery 1885); 'The Spy,' an incident in the Franco-Prussian War; and 'Lady Reading a Letter' (1892). In 1891 he was appointed instructor in the Art Academy at Karlsruhe, and

MEYERBEER—MEYRICK

1895 professor in the Art Academy at Düsseldorf. At the Berlin Exhibition of that year he was awarded the grand gold medal.

Meyerbeer, mi'ër-bär, Giacomo (Italianized form of Jakob Meyer Beer), German composer: b. Berlin 5 Sept. 1791; d. Paris 2 May 1864. His father, Jakob Beer, was a rich banker of Jewish descent, and of high reputation in the commercial world. The son gave early proof of his devotion to the art of music, and at nine was regarded as a masterly pianist in a city full of excellent musicians. After studying composition under Bernhard Anselm Weber he entered in 1810 the school of the Abbé Vogler at Darmstadt, where for three years he had the companionship of Karl Maria von Weber (q.v.). An intimate friendship sprang up between them, which was only interrupted by the death of the latter. While at Darmstadt Meyerbeer composed a cantata, 'Gott und die Natur,' which brought him the appointment of court musician to the grand-duke. In 1812 his opera 'Jephthas Tochter' was produced at Munich, but failed to please the audience, though highly praised by Weber, Vogler, and other musical authorities. Discouraged by its public reception, Meyerbeer went to Vienna, where he made his début as a pianist with such success that he seemed destined to eclipse the fame of all contemporary artists. Commissioned by the court of Vienna he produced 'Abimelek, oder die beiden Kalifen,' which was no more successful than his former effort. He was induced to visit Italy, and became a convert to the new musical school of that country. He rapidly composed in this style a series of operas, which were generally well received:—'Romilda e Costanza' (1818); 'Semiramide Riconosciuta' (1818); 'Emma di Resburgo' (1820); 'Margherita d'Anjou' (1822); 'L'Esule di Granada' (1823); and 'Il Crociato in Egitto' (1824). The success of the last-mentioned opera traveled beyond the Alps, and the composer was invited to Paris to superintend the preparations for the production of the 'Crociato' at the Grand Opéra, where it met with an enthusiastic reception. In 1831 his 'Robert le Diable' was produced for the first time, and the excitement it caused was perhaps unparalleled on the Parisian stage. Meyerbeer had ceased to be a pupil of Rossini, and 'Robert' combined in a singular degree oriental gorgeousness, German massiveness, French vivacity, and Italian brilliancy, which the preceding works of the composer had not prepared the world to expect. He reached the climax of his fame by his next opera, 'Les Huguenots' (1836). It was followed at long intervals by 'Le Prophète' (1849); 'Pierre le Grand' ('L'Étoile du Nord' 1854); 'Le Pardon de Ploermel' ('Dinorah' 1858); and 'L'Africaine' (1865). The composer did not live to see the production of his last work. Besides his operas he wrote many songs, an oratorio, cantatas, a Te Deum, music for the tragedy of 'Struensee' by his brother, and other works. Consult: Pougin, 'Meyerbeer' (1864); De La-salle, 'Meyerbeer, sa Vie Catalogue de ses Œuvres' (1864); De Bury, 'Meyerbeer, sa Vie, ses Œuvres et son Temps' (1865); Mendel, 'Giacomo Meyerbeer, eine Biographie' (1868).

Meyerheim, Friedrich Eduard, frêd'rih ed'oo-ard mi'ër-him, German artist: b. Dantzic 7 Jan. 1808; d. Berlin 18 Jan. 1879. He studied landscape painting in his native town,

and in his 22d year went to Berlin, where he attended the Academy and fell under the influence of Schadow. Ten lithographic views of Dantzic, published by him in 1832, were included in his 'Architektonische Denkmäler der Altmark Brandenburg,' which appeared the following year. Between 1833 and 1841 he produced a number of genres with a romantic motif as illustrative of peasant and bourgeois life. Of such a character is 'The Champion Shot' (1836) in the Berlin National Gallery. In his search for character, costume, scenery and incident he traveled, studied and sketched over a wide area of territory which included Westphalia, Altenburg, Thuringia, Hesse, and the Harz district. His admirable genres are distinguished by a clear enamel-like coloring. Amongst the most notable are: 'Leaving Church in Altenburg'; 'In an Altenburg Cornfield'; 'The Little Kid' (1842); 'Bedfellows' (1844); and his masterpiece, 'Waiting' (1845). Consult his 'Autobiography' (1880).

Meyerheim, Paul, powl, German painter: b. Berlin 13 July 1842. He was a son of Friedrich Eduard Meyerheim and was taught by his father, and afterward studied at the Berlin Academy. Travel through Belgium and Holland enlarged his artistic experience and knowledge, and he afterward spent a year at Paris. He then returned to Berlin, where he applied himself to animal painting, but also did some portrait, genre of common life, humorous scenes, still life, interior decoration of buildings, etc. He executed works both in oil and watercolors, and his versatility is only equaled by his delicate sense of color and brilliant technique. Considering all these qualities his fertility must be called extraordinary. Some of his best works are: 'History of the Locomotive in Seven Pictures on Copper' (Villa Borsig, Berlin); 'An Antiquary of Amsterdam' (1869); 'Four Seasons in the Life of a Bird'; 'In the Menagerie' (1891); 'Portrait of his Father and D. Chodowiecki' (1887); 'The Theatre of Monkeys'; 'The Hare and the Frog'; 'Tourists in the Mountains Meeting a Herd of Cattle'; etc. In 1863 he undertook a journey into Egypt, from which he brought back many landscape and figure studies. He is a Royal professor, and has been awarded the grand gold medal at the Berlin Exhibition.

Meynell, mi'něl, Alice Thompson, English poet and essayist: b. London, England. She spent much of her childhood in Italy, and was married in 1877 to Wilfrid Meynell, a London journalist. She has published 'Preludes,' a collection of poems (1875), illustrated by her sister, Lady Elizabeth Butler (q.v.); 'Rhythm of Life' (1893); 'The Color of Life' (1896); 'The Children' (1896); 'The Spirit of Place' (1898); 'John Ruskin' (1900); 'Later Poems' (1901). Consult Archer, 'Poets of the Younger Generation' (1902).

Meyrick, mi'rik, Frederick, English Anglican clergyman and controversialist: b. Ramsbury vicarage, Wiltshire, 28 Jan. 1827. He was educated at Oxford, where he was tutor (1851-9). Since 1868 he has been rector of Blicking, Norfolk, and a canon non-residentary of Lincoln from 1869. Among his many works, some of which are controversial books in Latin, Spanish, etc., may be cited 'The Practical Working of the Church in Spain' (1857);

MEZEN — MIAMI

'Kingsley and Newman' (1864); 'Justin Martyr' (1896); 'Ritual and Ritualism' (1901).

Mezen, mēz-āny', or **Mesen**, a river in the northern part of Russia in Europe. It rises in the Timan Mountains, flows north and south, forming two loops, then its course changes to the northwest, and enters the White Sea through Mezen Bay. It is about 525 miles in length. It is navigable for some distance from the mouth; but is ice-locked about six months in the year.

Meze'reon, a shrub (*Daphne mezereum*). See DAPHNE.

Mézières, Alfred Jean François, āl-frā zhôn frān-swā mā-zē-ār, French critic and politician: b. Rehon 19 Nov. 1826. He studied at the Ecole Normale and in Athens; was professor of literature at Nancy (1854-61), and at the Sorbonne; became an Academician in 1874; in politics is a member of the moderate Opportunists; and was deputy from 1881 to 1900, when he was elected senator for Meurthe-et-Moselle. Besides contributions to the 'Revue des Deux Mondes' and 'Temps' he wrote 'Shakespeare' (1861), 'Shakespeare's Predecessors and Contemporaries' (1863); 'Shakespeare's Contemporaries and Successors' (1864); 'Dante' (1865); 'Petrarch' (1867); 'Goethe' (1872-3); 'In France' (1883); 'Outside of France' (1883); 'Mirabeau' (1891); and 'Dead and Living' (1898).

Mez'zanine, in architecture, a low window occurring in attics and entresols. Sometimes applied to an entresol. A mezzanine story is a half story; one lower than the stories above and below it. In theatres it is usually a floor between the stage and the bottom of the deep cellars of large theatres, from which floor the short scenes and traps are worked, the large scenes going down through openings into the cellar; hence the name, from being midway between the stage and cellar floor.

Mezzofanti, Giuseppe Gaspardo, joo-sĕp'pĕ gās-pār'dō mēd-zō-fān'tē, Italian linguist: b. Bologna 17 Sept. 1774; d. Rome 15 March 1849. He studied at the seminary of Bologna, and took priest's orders in 1797. He was appointed librarian and professor of Oriental languages at the university, in 1831 went to Rome, there succeeded Angelo Mai as keeper of the Vatican Library (1833), and in 1838 was made cardinal. It is said that he was familiar with over fifty languages, and even with the provincialisms of these various tongues. Byron called him "a monster of languages, the Briareus of parts of speech." His library and his papers came into the possession of the University of Bologna. His attainments were not entirely limited to proficiency in languages, but only one printed work of his, a eulogy of Emmanuele da Ponte, a Spanish Jesuit who had taught him Greek, is in existence. Consult the 'Life' by Russell (1858; 2d ed. 1863); Manavit, 'Esquisse Historique sur le Cardinal Mezzofanti' (1854); 'Quarterly Review,' Vol. CI.

Mezzotint, met'sō-, a process of engraving on copper which dates from the 17th century. The smooth plate of the metal is abraded with a file-like tool, and tiny points are raised over the surface. These points catch and hold the ink, and an impression taken from a plate in this condition would give a soft velvety mass of black without variety of light and shade. A burnisher

is next used to get rid of the raised points where half tones and lights are wanted. Sometimes where very brilliant high lights are required, they are cut away so as to insure a smooth surface of copper. By means of this burnishing process, all gradations of light and shade are obtained from the white of the smooth copper to the black of the roughened plate.

Mhow, m-how', India, town and British cantonment, in the Rajput state of Indore, 13 miles southwest of Indore. The town, situated on an eminence above the Gumber, is European in its appearance, having a church with a conspicuous steeple, a well-furnished library, a spacious lecture-room, and a theatre. The cantonment, occupied by a considerable force, in virtue of the Treaty of Mandsaur, is situated half a mile southeast of the town, at the height of 2,019 feet above the sea. Mhow was one of the centres of the Sepoy mutiny of 1857. Pop. (1901) 36,040.

Miagao, mē-ā-gā'ō, Philippines, a pueblo of the province of Iloilo, Panay, on the southern coast of the island on Iloilo Strait, 22 miles west of Iloilo, the provincial capital. Pop. 22,100.

Miako, mē-ā'kō. See KIOTO.

Miall, mī'al, Edward, English non-Conformist politician: b. Portsmouth 8 May 1809; d. Sevenoaks, Kent, 29 April 1881. He studied at Wymondley Theological Seminary, Hertfordshire; was pastor of independent chapels in Ware, 1831-4, and in Leicester, 1834-41; then removed to London, where he founded the "Non-Conformist," a weekly devoted to disestablishment; and in 1852 was elected to the House of Commons. He urged the disestablishment of the Irish Church in 1856, and repeatedly moved for the formation of committee on English disestablishment. He retired from Parliament in 1874, and received a subscription of 10,000 guineas in 1873. He wrote 'The Non-Conformist Sketch Book' (1845), 'The British Churches in Relation to the British People' (1849); 'An Editor off the Line' (1865), and 'Social Influences of the State Church' (1867). Consult the 'Life' by his son Arthur (1867).

Miall, Louis C., English naturalist: b. Bradford 1842. He was made curator of the Leeds Literary Society in 1871 and professor of biology in Yorkshire College in 1876. He is a fellow of the Royal Society and an examiner for the Indian Civil Service; became president of the zoological section of the British Association in 1897; and has written 'Object Lessons from Nature' (1891); 'Anatomy of the Indian Elephant' (1878); 'Natural History of Aquatic Insects' (1895); 'Round the Year' (1896); 'Thirty Years of Teaching' (1897); 'Injurious and Useful Insects' (1902).

Miami, mī-ām'ē or -ī, a river of Ohio, which rises in Hardin County and flowing south and southwest for a distance estimated at 150 miles, passing Troy, Dayton, and Hamilton, enters the Ohio River at the southwest corner of the State, 20 miles west of Cincinnati. It is a rapid stream, passing through a picturesque and fertile country, and admits of navigation for only a portion of its length. Its principal branches are the West Branch, the Mad and the Whitewater rivers. The Miami canal runs along the river for about 70 miles, and together they furnish extensive power for manufacturing pur-

MIAMI INDIANS — MICA

poses. This river is sometimes called the Great Miami, in distinction from the Little Miami, which rises in Madison County, and after a southwest course of about 100 miles, nearly parallel to the former, enters the Ohio six miles east of Cincinnati. It is skirted for the greater part of its course by the Little Miami railroad, connecting Xenia and Cincinnati.

Miami Indians, an American tribe of the Algonquian family, residing in Wisconsin, and first known to the French settlers in 1660. In 1700 they removed to Illinois, Indiana, and Ohio, and later separated into two distinct tribes Wea and Piankshaw. In the Colonial wars the Miamis figured with both combatants, but eventually joined Pontiac's alliance in 1764, opposing the Americans. After their defeat by Gen. Wayne they signed a treaty at Greenville in 1795. They again joined the British against the Americans in 1812, fighting under Tecumseh (q.v.). In 1827 they sold most of their lands and removed to Kansas. Disease killed off the majority of them, and the remnant of the tribe, numbering perhaps 50, now reside upon the Quapaw reservation in Indian Territory.

Miami University, in Oxford, Butler County, Ohio, is a coeducational institution. In 1788 J. C. Symmes purchased from the United States 1,000,000 acres of land, bounded south by the Ohio River, east by the Little Miami, and west by the Great Miami. One condition of this purchase was, that a full township, six miles square, should be set apart "for the endowment of an academy and other seminaries of learning." This condition was not complied with; but as the prospect of the establishment of a university within the bounds of Symmes' purchase had induced many to settle there, in 1803 Congress ceded to the State of Ohio the township of Oxford, to be held in trust for educational purposes. The university was incorporated in 1809. The lands are leased for 99 years (renewable forever, without re-valuation), subject to an annual quitrent of 6 per cent on the purchase money. The government is vested in a board of 18 trustees appointed by the governor of the State, six of whom retire every third year. A grammar school was established in 1818, and in November 1824 the college department proper was opened. The school has normal, preparatory, and college departments, the courses leading to the degrees of B.A. and B.S. In 1903 there were connected with the institution 25 professors and instructors and 247 students. The grounds and buildings were valued at \$250,000; the productive fund was about \$52,000. There were over 19,000 volumes in the library. The State aid amounted to about \$23,000, and the total income from tuition, productive fund, and State was about \$34,000. The first class, consisting of 12 members, was graduated in 1826.

Miamisburg, mī-ām'iz-bèrg, Ohio, city, in Montgomery County; on the Miami River and the Miami & Erie Canal, and on the Cleveland, C., C. & St. L. and on the Cincinnati, H. & D. R.R.'s; about 45 miles north by east of Cincinnati. It is an agricultural region, and the good water-power has made it an important manufacturing place. It has large shipments of tobacco, manufactures, and cereals. One of the largest Indian mounds in the State is just outside the city. Pop. (1890) 2,952; (1900) 3,941.

Mian'a-bug, a Persian tick of the genus *Argas*, greatly dreaded by travelers in former times; but its reputed powers of poisoning and otherwise harming humanity have been greatly exaggerated.

Miantonomoh, mī-än-tō-nō'mō, an American Indian chief, a sachem of the Narragansetts, who succeeded his uncle, Canonicus, in 1636. In 1637 he assisted the early settlers of Massachusetts in the Pequot war. In 1643 he attacked Uncas, his bitter rival, was captured and turned over to the commissioners of the United Colonies. He was placed on trial before an ecclesiastical court, found guilty, condemned to death, and Uncas was commissioned to carry out the sentence. A brother of Uncas, however, assassinated the captive before the sentence could be executed.

Mias'ma, or **Mi'asm** (Greek, "pollution"), a disease-producing emanation in the atmosphere, from decaying animal or vegetable material; malaria; malarial poison. Diseases at one time supposed to be thereby produced were classified as miasmata — such as intermittent and remittent fever, typhus, and typhoid fever. The term is used infrequently at the present day, as micro-organisms (bacteria-germs) are believed to be responsible for the spread of most of these diseases, and do not exist in the form of a miasm. While some of these organisms are carried by the atmosphere, and are inhaled, others are conveyed by insects to articles of food, and are taken into the body when such food is eaten. Others, still, are elaborated in a kind of mosquito (*Anopheles*) and injected into the blood. See INSECTS, PROPAGATION OF DISEASE BY; MALARIA.

Mica (Lat. *mico*, flash), a mineral group, marked by high basal cleavage, and laminae which may be made very thin by a process of continued separation. The micas are silicates; muscovite, the commonest, is a silicate of potassium and aluminum, and is often syled potassium mica; paragonite, or sodium mica, corresponds closely to muscovite, but has sodium instead of potassium; biotite, a silicate of magnesium, potassium and iron, is marked by its darker tints, and is commonly called magnesium iron mica; lepidolite is a lithium mica, with fluorine, potassium, and aluminum in its composition, and a rose tint. Mica is widely scattered in North America and Asia, especially India. Ruby colored mica, no matter what its provenance, is now called "Indian." Europe has no commercial supply. Deposits are most frequently found in pegmatite dikes, varying in thickness from a few inches to several hundred feet, and correspondingly in length. Many other minerals accompany it, especially quartz and feldspar, and the mica is scattered through the dike, or vein, as the miners call it. Moreover, scarcely more than 10 per cent, and sometimes as little as 2 per cent, is commercially useful. Mica was well known in prehistoric America, traces of its use being widespread. A great shaft near Mount Mitchell, in North Carolina, was discovered in 1869. This not merely solved the question as to the origin of the early supply, but gave the first impulse to the mining of mica in the United States. Mica lands in North Carolina became tremendously valuable. This boom was quickly followed by the development of the industry in southern New Hampshire; and this in turn by

MICA SCHIST—MICHAEL

important discoveries, in the 80's, in Canada and India. In Quebec, Ottawa, and Perth and Renfrew counties, Ontario, the supply is of excellent quality, and hence is easily mined and cheap. Hindu labor and an excellent grade of mica make the output of Bengal, Bombay, and the Madras presidency even cheaper. To classify the various sources of supply roughly, it may be said that India gives the world one half, and Canada and the United States each about one fourth of the entire supply. Everywhere the "veins" start near the surface; hence mining is simple. In New Hampshire there has been a break from the primitive methods, but in North Carolina, apparently the richest field in the United States, the mining is still unorganized, being done almost entirely by farmers, with the simplest of tools, between crops. In this region, mica is largely used as a medium of exchange between farmers and storekeepers.

In 1870 mica waste was first utilized by Frederick Beck, who introduced the use of "mica-flour," or ground mica, as a coating for cheap wall-papers. Scrap-mica, formerly worthless, rose to \$17 a ton, and then gradually fell to \$6 or \$7. This branch of the business is confined to the United States. Since 1895 there has been a fresh and most important use for mica, namely, as an insulator. For this purpose the sheets are split very thin and glued to cloth, then wound into rings for armatures. As a result of this variation of the uses of mica, only the colorless sorts, notably muscovite, are longer used for lamp chimneys and stove doors. Mica is also valuable as a lubricant, as an absorbent of glycerin in making dynamite, and, in the case of the lithium silicates, such as lepidolite, in the manufacture of lithium salts.

Mica Schist, schist, a schistose rock, metamorphic in nature, containing mica and quartz. The origin of most of the mica schists is uncertain; the sericite variety seems to be the result of mountain-building forces acting upon igneous rocks; other sorts are almost as certainly due to the same force acting upon sedimentary rocks. Mica occurring in schist is usually muscovite, that is, the colorless sort; biotite, or dark mica, is less frequent. Various embedded minerals occur, notably garnets.

Micah, mī'ka, the sixth of the minor prophets, dwelt in Moresheth, a little town, once a dependency of the Philistian city of Gath, but by the conquests of Uzziah reduced with the whole of western Judah, including the city of Gath, to Hebrew domination. His main public work was accomplished during the reign of Hezekiah. He dwelt on the great international highway between Egypt and Assyria and was led to take a wide view of the political movements in Western Asia in their effect upon his own people. He lived in the 8th century B.C. and he witnessed the ending of the northern kingdom, and the invasion of Palestine by Sargon and Sennacherib. He witnessed also the corruption of morals which Hezekiah only partially corrected. His prophecy is directed against Samaria and Jerusalem, whose sufferings for their sins and irreligion he declares shall be greater than those of Babylon and the other Gentile cities. His style is pure and correct, his images bold, his denunciations full of strength and severity.

Micah Clarke, a novel by A. Conan Doyle, published in 1888. It presents in the form of

fiction a graphic and vivid picture of the political condition in England during the western rebellion, when James, duke of Monmouth, aspired to the throne, and Englishmen were in arms against Englishmen.

Micawber, mī-kā'bēr, **Mr. Wilkins**, a shiftless, unsuccessful optimist, always in trouble, but always sure "something will turn up," one of the secondary characters in Dickens' 'David Copperfield.' He is said to have been drawn after the novelist's father, and Mrs. Micawber, who has great faith in her husband, to have been patterned after Dickens' mother.

Michael, mī'kēl or mī'kā-ēl (Hebrew, "who is Godlike"), is spoken of in Daniel (x. 13, 21; xii. 1) as one of the "chief princes," and the "great prince." In Jude (verse 9) he is called the archangel who disputed with the devil about the body of Moses. In the Revelation (xii. 7) it is said "there was war in heaven: Michael and his angels fought against the dragon." From this expression it has been inferred that he was the chief of the celestial hierarchy. Milton calls him "of celestial armies prince," and "prince of angels," and attributes to him the command of the heavenly forces. He was ranked by Thomas Aquinas, followed by Dante, as the first of the seven archangels. In France especially churches dedicated to this saint are often built on the loftiest hill tops, to afford the warrior angel a vantage ground in warring against the evil "powers of the air" and driving off plague, drought and murrain.

Michael I., Rhangabe, or **Rhagabe**, Byzantine emperor: d. about 845. He succeeded Stauracius in 811 and after carrying on war with the Bulgarians was deposed in 813 by Leo V, an Armenian general in his service, and spent the rest of his life in a convent.

Michael II., Balbus (THE STAMMERER), Byzantine emperor: d. 829. He came of an obscure Phrygian family, but was ennobled by Leo V. The latter, however, suspecting Michael of conspiracy against him, ordered the Phrygian to be put to death. Michael saved himself by the assassination of Leo and became emperor in 820. During his reign Sicily and Crete were lost to the Western empire.

Michael III. (THE DRUNKARD), Byzantine emperor: d. 867. He was a grandson of Michael II., and in 842 succeeded his father, Theophilus, though his mother Theodora, continued regent till 856. With his uncle, Bardas, he made an expedition against the Bulgarians in 861 and converted the king of Bulgaria. In 866 he associated Basilus the Macedonian with himself in the government and was assassinated by him the next year.

Michael IV. (THE PAPHLAGONIAN), Byzantine emperor: d. 1041. He received his surname from the place of his nativity, and became chamberlain to Zōe, wife of the Emperor Romanus III. On the death of Romanus in 1034 he became emperor and the husband of Zōe, who is presumed to have murdered Romanus because of her love for Michael.

Michael V., Calaphates (THE CALKER), Byzantine emperor. He was a nephew of Michael IV., whom he succeeded on the throne. His banishment of the Empress Zōe led to a revolt in Constantinople, in which he was overthrown and compelled to retire to a convent.

MICHAEL — MICHAUX

Michael VI. (THE WARRIOR), Byzantine emperor. He succeeded the Empress Theodora in 1056, but after the expiration of a year was deposed by Isaac Comnenus and spent the rest of his life in a convent. He was the last of the Macedonian dynasty.

Michael VII., Ducas, or Parapina'cea, Byzantine emperor. He was the son of Constantine XI., and came to the throne in 1071. He was a weak monarch, the prey of unscrupulous favorites, and an insurrection in 1078 drove him from the throne and into a monastery.

Michael VIII., Palaeologus, Byzantine emperor: b. 1234; d. December 1282. After having commanded the French mercenaries employed by the emperor of Nicea he became one of the guardians of the Emperor John Lascaris in 1259. The next year he was proclaimed joint emperor of Nicea in 1260, and the next year after deposing his colleague Lascaris, became sole monarch. In the same year he wrested Constantinople from the Latins and was shortly afterward crowned emperor of the Byzantine empire. He made an unsuccessful attempt to effect the union of the Western and Eastern Churches.

Michael IX., Palaeologus, Byzantine emperor: d. 1320. He was the son of Andronicus II., with whom he was associated in the government after 1295, but died before his father.

Michael, czar of Russia. See ROMANOFF.

Michaelis, Johann David, yō'hān dā'vêd mē'hā-ā'lis, German biblical scholar: b. Halle, Prussia, 27 Feb. 1717; d. Göttingen 22 Aug. 1791. He studied at the University of Halle, traveled in Great Britain and Holland, became professor of philosophy at Göttingen in 1746, and professor of Oriental languages there in 1750. He was one of the editors (1753-70) of the 'Göttingen gelehrte Anzeigen,' and served for a time as librarian to the university. Modern biblical criticism in Germany sees in Michaelis one of its forerunners, whose works are of interest in the history of its development. They include his 'Hebräische Grammatik' (1778); 'Einleitung in die göttlichen Schriften des neuen Bundes'; 'Mosaisches Recht'; 'Moral' (1792-1823); 'Orientalische und exegetische Bibliothek' (1786-93). Consult his 'Lebensbeschreibung von ihm selbst abgefasst,' ed. by Hassencamp (1793), and his letters (1794-6).

Michaelius, mē-kā'lē-oos, Jonas, first Dutch Reformed minister in America: b. in the north of Holland 1577; d. Holland after 1637. He studied at Leyden, had a country church in Holland from 1612 to 1616; was sent to San Salvador, Brazil, in 1624; was transferred thence to Guinea in 1626; and in 1628 went to Manhattan, where he organized a consistory after the Dutch Reformed government. His last years were spent in Holland. A letter written by him describes the condition of the New York Indians, urging work among the children; it is published in the New York Historical Society's 'Collections' (1880).

Michaelmas, mīk-el-mas, the feast of St. Michael and All Angels, 29 September. The festival was first appointed by Pope Felix III., 480. In the Greek Church it did not originate earlier than the 12th century. It was an old custom in England to mark the day by electing civil magistrates, perhaps in allusion to the anal-

ogy between the superintendence of magistrates and that of guardian angels, of whom St. Michael was reputed the prince. A more famous custom is that of eating roast goose, the origin of which has long exercised the wisdom of antiquaries. The traditional Michaelmas goose has been traced at least as far back as the 10th year of Edward IV.; and it is said that one of the strongest objections of the English commonalty to the reformation of the calendar was based on the confusion which would follow if Michaelmas day was not celebrated when stubble geese are in their highest perfection. There is an old proverb: "If you eat goose on Michaelmas day, you will never want money all the year round."

Michal, wife of King David and younger daughter of King Saul. After David was driven away from court, and his life saved by Michal, who favored his escape, her father married her to Phalti, from whom David eventually recovered her, but was permanently alienated from her by her levity and want of sympathy with his enthusiastic joy over the return of the ark to Jerusalem.

Michaud, mē-shō, John Stephen, American Roman Catholic bishop: b. Burlington, Vt., 24 Nov. 1843. He was graduated from Holy Cross College, Worcester, Mass., in 1870, and was ordained in the priesthood in 1873. He was consecrated bishop in 1892.

Michaud, Joseph François, zhō-zěf frāñ-swā, French historian: b. Albens, Savoy, 19 June 1767; d. Passy 30 Sept. 1839. He became a journalist at Paris, where he wrote for Royalist papers, and stoutly upheld the monarchy; and in 1794 established the 'Quotidienne.' His opposition to the Revolution brought upon him sentence of death (27 Oct. 1795), and though the sentence was later revoked, he was finally exiled by the Directory, and went into hiding in the Juras. He was allowed to return under the consulate, but remained an apologist of the Bourbons, and at the Restoration took up the publication of the 'Quotidienne.' The well-known 'Biographie Universelle' was published under his direction. Among his more important works are: 'Histoire de l'Empire de Mysore' (1801); 'Histoire de Croisades' (1812-22); and 'Collection de Mémoires pour Servir à l'Histoire de France depuis le XIII^eme Siècle' (1836-9).

Michaux, André, ān-drā mē-shō, French botanist: b. Satory, Versailles, 7 March 1746; d. Madagascar 16 Nov. 1802. His father, a rich farmer, took him into partnership, but the death of his wife soon after their marriage drove him to the study of botany and to travel. He traveled through France and England in 1779-81; then through Persia and to the borders of Tibet (1782-5); and in 1785 to North America, where he made an exhaustive study of the flora of the Atlantic coast, and near Charleston, S. C., and in Bergen County, N. J., established large nurseries. In 1800 he set out on a trip to Australia, but died in Madagascar. He wrote a 'History of the Oaks of North America' (1801) and 'Flora Boreali-Americana' (1803).

Michaux, François André, French botanist, son of André Michaux (q.v.): b. Versailles 1770; d. Vauréal 23 Oct. 1855. He was his father's assistant, and in 1802 and 1806 was sent to North America by the French government.

MICHEL — MICHELANGELO BUONARROTI

He wrote a 'Journal' of his travels, translated into English (1805); 'The Naturalization of American Forest Trees' (1805); and the important 'North American Sylva,' translated by Hillhouse (1817-19) and completed, for western America, by Nuttall (1842-50).

Michel, François Emile, frän-swä ä-mël mē-shël, French painter and art critic: b. Metz 1828. After studying under Migette and Maréchal, he made his début in the Salon in 1853, since which he has produced 'Summer Nights' (1872); 'Sowing in Autumn' (1873); 'The Harlem Sound' (1885); the two latter being now in the Luxembourg. He was elected to the Institute in 1892. Among his works are: 'Rembrandt' (1886); 'Hobbema et les Paysagistes de son Temps en Holland' (1840); 'Jacob van Ruysdael et les Paysagistes de l'Ecole de Haarlem' (1890).

Michel, Louise, French anarchist: b. Vroncourt, Upper Marne, France, 29 May 1830. When very young she wrote verses of unusual power and in 1860 opened a school in Paris. During the government of the Commune in 1871 she worked zealously in its behalf, was made prisoner, sentenced to deportation for life, but was pardoned by the amnesty of 1880 and returned to Paris where she edited 'La Révolution sociale' and continued her anarchistic teachings. She was imprisoned in 1883 and in 1886, and has since made her home in London, where she continues her work. She published: 'Le Coq Rouge'; 'Les Méprisées'; 'Ses Mémoires'; 'L'Ere Nouvelle'; etc.

Michelangelo Buonarroti, mi-kël-än'jě-lō or mē-kël-än'jā-lō, boo-ō-nār-rō'tē, whose name during his lifetime was written as Michelagnolo (or Michelangiolo) di Ludovico di Buonarroti-Simoni; Italian sculptor, painter and architect: b. Caprese, Tuscany, 6 March 1475; d. Rome 18 Feb. 1564. The family was well established as a family of citizens in Florence; but had been allowed heraldic bearings, a custom not unusual in relation to the controlling families of the Italian cities.

At a very early age Michelangelo became a student of fine art, entering first the workshop of Domenico Bigordi, called Ghirlandajo, and studying also in a primitive kind of art school which had been formed in the palace and gardens of Lorenzo dei Medici. It appears that the extraordinary abilities of the boy were noticed by his patrons and also by the artists of the epoch from the first. Michelangelo thought of himself only as a sculptor, and he put his energies into the study of bas-relief and statuary; studying the remains of Græco-Roman antiquity, which were accessible, and producing works of such importance as caused surprise to his contemporaries, although most of these very early works are either lost altogether or are uncertain—pieces which are usually ascribed to this epoch not having certain ascriptions. The earliest very important work which has remained to us is the Pietà, which is now in a chapel of St. Peter's Church at Rome. The figures are slightly larger than life, the Madonna holding the body of Christ on her lap in a not unusual attitude; a belt passing over the left shoulder of the Virgin is inscribed with the name of Michelangelo the Florentine: which is for years the only case in which Michelangelo signed a piece with his name. The famous group of the

Madonna and Child in the Church of Notre Dame at Bruges, in Belgium, is generally accepted as the work of Michelangelo, and if so, was of this early epoch. The reason for its transportation to Bruges is disputed. An entirely authentic piece of the time is a colossal David, which having been for three centuries in the open air at the portal of the Palazzo Vecchio at Florence, is now under shelter in the Accademia in the same city. This extraordinary work is a frank attempt to render the as yet imperfectly developed form of a very young man.

The only portable painting which can with certainty be ascribed to Michelangelo belongs to the closing years of the 15th century, when Michelangelo was approaching the age of 25 years. This is the circular picture, a Madonna with the Child and St. Joseph, in the Uffizi Gallery. The fact of his producing this and several other small works of painting, is not to be counted against his accepted position as a sculptor; for most of the artists of the time practised in the different arts, and it is probable that Michelangelo was at this time much less in the habit of painting than were other sculptors of well known ability. His own continual occupation upon works of pure form in marble was a sufficient reason for his continued abstention from the sister arts.

With the election of Pope Julius II. began the Roman life of Michelangelo, for he was called upon by the new Pope in 1505 to build a great monument which the Pope desired to finish within his own life-time. This monument was never completed, however, and the controversies and other difficulties which arose continually with regard to it, embittered a large part of the great artist's life and consumed time which could but ill be spared from actual work. The great statue of Moses, which was executed at a somewhat later time (not to be exactly fixed), was the only very important piece of statuary completed for this tomb.

In 1506 Michelangelo returned to Florence, and at that time there was a decided pause in the work upon the tomb, as other thoughts had taken up the mind of the Pope. Indeed, his return to Rome was followed immediately by the commencement of the painting upon the vault of the Sistine Chapel. This work as we have it is much the most important piece of mural painting of the modern world, for it occupies the whole vaulted room, 133 feet long and 45 feet wide, and is one continuous and unbroken composition containing hundreds of figures, life-size, of heroic size, and colossal, and done in pure fresco, except as it has been retouched in places either by the artist himself or in later times, in what is called dry fresco—that is to say, the colors laid upon the dry plaster. There is this marked characteristic of the painting—that it has no landscape backgrounds except in the small compartments devoted to The Deluge and The Temptation, nor any other accessories as of costume, arms, buildings and the like; but is everywhere a simple architectural composition of painted pedestals and corbels seeming to carry figures which themselves are painted in the most abstract way—studies of the human form simply dressed and having no artistic interest other than that. It has generally been considered that the paintings draw their only importance from the astonishing

SECRET

[REDACTED]

MOSES

MICHELET

ing power of the draughtsmanship and the great composition of abstract lines; but a more careful consideration of what they were before their partial defacement by the smoke of candles and the injuries and repairs which they have received, shows that the work is one of interest as to color composition as well. Michelangelo has never shown himself to be a colorist in the sense in which Correggio and the great Venetians were colorists, but then the medium in which he painted was fresco, that is, painting upon wet plaster, which does not lend itself to elaborate combinations of warm and profuse coloring—its tendency is always toward pale combinations and the expression of delicately modulated form rather than of chromatic splendor. It is not, however, intelligent criticism to say that these paintings are the work of a sculptor taken rudely from the practice of his own art. On the other hand, it is quite unreasonable to say, as some English critics have said, that the turning of Michelangelo to sculpture had been unfortunate, as depriving us of the greatest of Christian religious painters while giving us only a melo-dramatic sculptor. The truth is that this artist is the most perfect exemplar of that way of treating all fine art, of which form alone (pure and abstract and almost separated from its usual purpose, as that of description and narrative), is the subject studied and gives the effect sought. Everything else—truth of anatomy, expression of face, energy of pose and of apparent movement—is subordinated to the one important thing—the getting of form which would be splendid in the artist's eyes. If, then, we have to regret a frequent excessiveness and extravagance of design, it can only be said that the extraordinary energy and force of the man, driving him on to undertake more than mortal man could achieve even had he been (as Michelangelo was not), left to pursue his own course in peace, resulted as of necessity in frequent exaggeration in the very desire to give vigor and as yet untried combinations of form as shown in the human body posed singly or in elaborate groups.

After 1513, when Julius II. died, Michelangelo undertook a façade for the Church of St. Lorenzo in Florence. This front was never finished; but not long after he began the building of a new sacristy for this church, in which square room, very finely adorned with classical architectural forms, are the two remarkable tombs of the princes Lorenzo and Giuliano dei Medici. These monuments have each a seated statue of the prince in question, raised high above the sarcophagus; and on the lid of the sarcophagus two colossal reclining figures, in each case one man and one woman. The sculptures were not all completed. The extraordinary power of their modeling has made these monuments very famous in the modern world.

About 1535 Michelangelo settled finally in Rome, and from that time until his death was very much occupied as an architect in connection with the great Church of St. Peter. The building had been going on for many years, and different architects had successively changed the design, so that Michelangelo took up the work at that point where it became necessary to roof the central mass. This he did by means of the famous cupola which dominates the city of Rome and the country around, although the rounded shell of stone itself was not erected during his lifetime.

As an architect Michelangelo was not, on the whole, beneficial to Italy or to the art of the 16th century, because he had never, as a youth, studied construction or the use of details, and because his almost exclusive devotion to more elaborate and organic forms than those possible to architectural masses, prevented his designing such features as frontons and consols with gravity and simplicity. The architecture inspired by him, and more especially that produced by his immediate successors, ran to extravagance; and the worst period of Italian decorative art was to follow upon his own epoch of work. The sculpture of his later years is much less important and much less in quantity than might have been expected; but the work upon the church occupied his energies, and in 1535 he was appointed by Pope Paul III., architect, sculptor and painter to the papal palace, and he began work immediately upon the east wall of the Sistine Chapel. Here he painted that prodigious Last Judgment, filling all the wall above the altar, including the lunette, and up to the nearly semicircular vault. The picture is, like the ceiling paintings, entirely a study of the human body in vigorous action, and in highly studied pose. As a work of color, or even of light and shade, it is almost unrecognizable for what it was, as the smoke of the candles on the altar has caused very great changes in color, and has led to repainting, and because of certain painted additions made in the next century in order to disguise the complete nudity of the figures.

Throughout his life Michelangelo had been a writer of verse, and it is known that important sonnets of his were left by him. These, however, were edited in a destructive manner by his nephew, so much so that we have at the present day no certain knowledge, even, of what the poems were as they left Michelangelo's hand. This part of his intellectual life has been treated with great thoroughness by John Addington Symonds in his life of the artist. The frescoes of the Sistine Chapel have been peculiarly the study of Heath Wilson who, about the middle of the 19th century, had a scaffolding erected in the chapel and studied the paintings inch by inch; and who recorded his observations in a valuable book. Apart from these two books and the life by Harford, the best book on Michelangelo is the volume of the *'Gazette de Beaux-Arts,'* published in 1876. This volume contains papers by the sculptor, Eugène Guillaume, the architect, Charles Garnier, and the competent writers, Charles Blanc, Paul Mantz, A. Mézières, and Anatole de Montaiglon.

RUSSELL STURGIS.

Michelet, Jules, zhül mësh-lä, French historian: b. Paris 21 Aug. 1798; d. Hyères 9 Feb. 1874. He was educated at the Lycée Charlemagne and in 1821 became a professor there. After the revolution of 1830 he was appointed chief of the historical section in the Archives, and in 1838 professor of history at the Collège de France. He lost his offices by his refusal to take the oath of allegiance to Louis Napoleon, and thereafter devoted himself to his busy literary labors. His *'Histoire de France'* (18 vols. 1833-67; new ed. 19 vols. 1879) is among the monumental productions of historical composition, and definitely established his fame. His *'Histoire de la Révolution'* (1847-53; new ed.

1889) is a splendid specimen of eloquent writing, but hardly a great history. In all his historical writing Michelet has been criticized for unduly subordinating historical values to dramatic effect. But his descriptions are remarkably vivid, and his rendering of certain episodes is unsurpassed. Among his further writings are: 'Précis de l'Histoire Moderne' (1827); 'Histoire Romaine' (1831), and several volumes of polemics and of natural philosophy.

Michelet, Karl Ludwig, kãrl lood'vig mē-shē-lã, German philosopher: b. Berlin 4 Dec. 1801; d. 16 Dec. 1893. He was graduated from the University of Berlin in 1824, and in 1828 was appointed to the professorship of philology and philosophy in the French gymnasium, which he held for 25 years. In 1829 he also became professor of philosophy in the University of Berlin. He devoted himself especially to the doctrines of Aristotle, and published 'Die Ethik des Aristoteles' (1827), an edition of the Nicomachean ethics with Latin commentary (1829-33), and a memoir entitled 'Examen Critique du Livre d'Aristotle, intitulé Métaphysique' (1836), which was crowned by the Academy of Moral and Political Sciences. From 1832 to 1842 he was engaged as one of the editors of Hegel's works, in illustration of whose system he wrote 'Geschichte der letzten Systeme der Philosophie in Deutschland von Kant bis Hegel' (1837-8); 'Entwicklungsgeschichte der neuesten Deutschen Philosophie mit besonderer Rücksicht auf den gegenwärtigen Kampf Schellings mit der Hegelschen Schule' (1843); and a controversial dissertation, 'Schelling und Hegel' (1839). His own standpoint and tendency are most decisively shown in his 'Vorlesungen über die Persönlichkeit Gottes und die Unsterblichkeit der Seele, oder die ewige Persönlichkeit des Geistes' (1841); and 'Die Epiphanie der ewigen Persönlichkeit des Geistes' (1844-52).

Mich'elson, Albert Abraham, American physicist: b. Strelino, Posen, Germany, 19 Dec. 1852. He came to the United States when a boy; was graduated at the U. S. Naval Academy in 1873; took graduate courses in physics in Berlin and Heidelberg, and in Paris at the Collège de France and the Ecole Polytechnique, between 1880 and 1882; and in the meantime had resigned from the navy to become professor of physics at the Case School of Applied Science, Cleveland, Ohio. From 1889 to 1892 he was professor of physics at Clark University, and since 1892 has been head of the department of physics in the University of Chicago. He is a member of many scientific societies and a contributor to scientific periodicals. His experiments at the Naval Academy in 1879 and at Cleveland in 1882 gave new figures for the velocity of light *in vacuo*. He made careful studies of the relative motion of ether and matter, and apparently proved that, though in general ether may have relative motion, within building walls, etc., it partakes of the motion of materials. About the same date (1886-7) his inferential refractometer made it possible to use wave-lengths of light as a measuring unit; this discovery was put to concrete use by his measuring a metre in terms of cadmium light wave-length; this was done for the Paris International Bureau of Weights and Measures, with the result that the metre is no longer an arbitrary unit, since the original metre-long bar so carefully preserved in Paris, could

easily be replaced at any time now that its length is known in terms of other units. This interferometer not only determines wave-lengths of red, green, and blue cadmium light, but separates lines less than one thousandth metre apart, and hence is a very delicate dividing machine. The echelon spectroscope, an arrangement of glass plates of equal thickness, but of surface area varying in arithmetical progression, was invented by Michelson in 1898; it is valuable for the study of the Zeeman effect, and for magneto-optics generally.

Michigan, one of the United States, admitted into the Union 26 Jan. 1837. It lies in the region of the Great Lakes, between lat. 41° 42' and 47° 32' N., and lon. 82° 24' and 90° 31' W. The State is divided into 83 counties. The capital is Lansing and the total population in 1900 was 2,420,982. (See *Population*.) The State has an area of 58,900 square miles including 1,470 square miles of water and 57,430 of land. It has a length of 305 miles from north to south and an average width of 200 miles. The State is practically surrounded by lakes and rivers; and is bounded on the north by Lake Superior; on the south by Indiana and Ohio; on the east by Lake Erie, Detroit Strait and River, Lake Saint Clair, Saint Clair River, Lake Huron and Saint Mary's River; on the west by Wisconsin and Lake Michigan.

Topography.—Michigan is sometimes called the Peninsular State, from its formation in two great peninsulas, the upper and the lower. The former has an extreme length east and west of 288 miles and a width of 164 miles; the latter has a length north and south of 277 miles and a width of 197 miles. Keweenaw and Saint Ignace peninsulas extend into Lake Superior. The upper or northern peninsula is mostly barren, rugged and rocky, although containing vast mineral wealth. The highest point in the State is a group of hills known as Porcupine Mountains, in the northwest part near Lake Superior. These mountains are 1,830 feet above the sea. From Keweenaw Point the famous mineral range extends westward into Wisconsin. These mountains form the watershed between the streams flowing into Lake Superior and Lake Michigan. The surface of the Lower Peninsula is generally level, broken in the southern portion by conical hills rising to an altitude not exceeding 200 feet. It is divided by a low undulating watershed running north and south, and rising at its highest point in the north about 800 feet above the lake surface, the larger portion of the State being on the west of this and gradually sloping toward Lake Michigan. The soil is of a varied composition and in large areas is very fertile, especially in the south. Among the 200 islands within the State boundaries are Isle Royale and Grande Isle in Lake Superior; Sugar Island, Encampment Island, Drummond Island, Bois Blanc and Mackinac in Lake Huron; and Beaver, Fox, and Manitou in Lake Michigan.

Climate.—In a State covering so wide a range of latitude, climatic conditions necessarily show large variations. The mean annual temperature varies from 40.4° in the Upper Peninsula to 46.9° in the southern part of the Lower Peninsula. The mean average temperature in July and August is 64.2° in the first named region, and

MICHIGAN

71.6° in the latter. In January and February, the mean average varies from 14.3° to 23.5°. The annual rainfall averages 28 inches. Owing to the proximity of the lakes, the climate of the southern peninsula is milder in winter and cooler in summer than in other parts of the country in the same latitude. In the northern part of the Lower Peninsula many attractive summer resorts have developed along the lake coast. At other places popular resorts have built up on account of the medicinal value of mineral springs, chief among these being Mount Clemens; while the waters of four mineral springs find a market.

Rivers and Lakes.—Along the lake coasts are numerous bays and inlets. Keweenaw, White Fish and the Big and Little Noyette bays are the principal indentations on the north; while the Grand and Little Traverse, Thunder and Saginaw bays indent the southern peninsula. The rivers are small, short and shallow. The most important are the Grand, flowing into Lake Michigan; and the Saginaw, flowing into Lake Huron; each of which is navigable for about forty miles. Among the other rivers may be mentioned the Au Sable, Thunder Bay, and Cheboygan, flowing into Lake Huron; Ontonagon and Tequamenon into Lake Superior; and the Saint Joseph, Kalamazoo, and Escanaba into Lake Michigan. Lakes abound throughout the State, over 5,000 in all, and no less than 175 are in the basin of the Kalamazoo River. These lakes are valuable sources of water supply, which is abundant throughout the State. The largest lakes are Houghton, Mulletts, and Burt's, in the northern part of the Lower Peninsula; and Manistique in the Upper Peninsula.

Geology.—The geology of the State represents every series known from the oldest strata to the carboniferous. Primary boulders are found over the entire surface, the northern part being principally of primitive origin, while Secondary deposits cover the entire southern peninsula. The Upper Peninsula exhibits Lower Silurian sandstones, limestones, copper and iron bearing rocks, corresponding to the Huronian system of Canada. The Mineral Range of Mountains is of eruptive or volcanic rock, with older strata tilted upon its side. Farther eastward are the long belts of the Lower Silurian, curving from Green Bay through the Saint Mary's Peninsula. The central portion of the southern peninsula contains coal measures and rocks of the permo-Carboniferous period. The coal-bearing area of about 5,000 square miles is in the neighborhood of Saginaw; but the coal is for the most part of inferior quality. The surface of the State is largely determined by glacial action, being covered with a sheet of till, in some places some hundreds of feet in thickness. The rivers are upon the drift surface.

Minerals.—Michigan possesses vast mineral wealth, especially in the copper and iron mines of the Upper Peninsula. The Calumet and Hecla and other famous copper mines are on Keweenaw peninsula; and furnish copper of a quality nowhere surpassed, and for some purposes unequalled. Until recently Michigan had the largest output of copper of any State, and still holds second rank, the product of 1901 being 69,772 tons. In iron ore Michigan was also first among the States, until within a few years, when Minnesota has taken first place by a small margin. In 1901 the Michigan output was 9,654,067 tons,

valued at \$21,735,592. Some gold is found in the Upper Peninsula, and silver and lead in small amounts. In the Lower Peninsula the most important mineral product is salt, found in large quantities in the Saginaw Valley. The output for 1901 was 7,729,641 barrels from 254 wells, valued at \$2,437,677, the largest amount from any State and one third of the total for the United States. In the same region (Bay and Saginaw counties) coal mining has been developed on a considerable scale, mainly since 1898. In 1901 the output was 1,241,241 short tons, valued at \$1,753,064. Brick, tile and other clay products are made easily and cheaply in many parts of the State, the total value of such products for 1901 being \$1,542,034. Within recent years the manufacture of Portland cement has been developed on a large scale; and in 1901 there were ten works with a total product of 1,025,718 barrels, valued at \$1,128,290. Building stone is found in many parts of the State; and in the Upper Peninsula this includes marbles and other ornamental stone, such as agates, jasper, chalcedony, and chlorastrolites. As yet, however, a comparatively small amount is marketed, the total value of the output for 1901 being \$859,215, mostly in sandstone and limestone. Large deposits of gypsum are found in the Lower Peninsula near Grand Rapids. In 1901 the output was 129,654 tons; and in 1900, 19,823 tons of land plaster and 206,380 barrels of stucco were produced. Glass sand is found in the extreme southeast of the State; on the shores of Lake Huron grindstones are quarried; while still other minerals exist in less important quantities in various parts of the State.

Forests.—One of the most important sources of wealth and material prosperity to Michigan has been its abundant forests. Originally the Upper Peninsula and the northern half of the Lower Peninsula were covered with dense forests of conifers, consisting mainly of white pine. Farther south, hard woods were intermingled in larger proportion; while the southern part was mostly prairie. Besides white pine, the principal trees include basswood, maple, elm, sassafras, butternut, walnut, poplar, hickory, oak, willow, birch, beech, hemlock, witch-hazel, tamarack, cedar, locust, dogwood, and ash. The total forest area of the State, including stump land, is estimated at 38,000 square miles, or two thirds of the total area. Until after 1860 the production of lumber was relatively small; but by 1870 Michigan had gained first place as a lumber State, and maintained that position until 1900, when owing to the partial exhaustion of her resources she fell slightly behind Wisconsin. Michigan is, however, still the second State in lumber production. The development of this industry is shown in the following table:

Year	Establishments	Capital	Average number of wage earners	Wages	Value of products
1850	\$2,464,329
1860	7,040,190
1870	1571	\$26,990,450	40,058	\$6,400,883	31,946,396
1880	1649	39,260,428	24,235	6,967,005	52,449,928
1890	2124	129,467,072	54,308	15,548,833	83,121,969
1900	1705	67,379,698	26,199	11,122,030	54,290,520

MICHIGAN

In 1900, the total cut of lumber was 3,462,152,000 feet. The standing merchantable timber owned by lumber establishments was estimated to be 14,546,100,000 feet, which represents probably half the timber then remaining in the State. The lumber products have also been of great service in developing other industries in the State, notably the manufacture of furniture, which centres at Grand Rapids.

Agriculture.—This is the chief industry in Michigan. One third of the industrial population is engaged in agricultural pursuits; and the value of farm property is more than double the capital of manufacturing establishments, and nearly one half of the total assessed valuation of all property in the State. The development of farming may be seen in the following table:

YEAR	Number of farms	Acres in farms	Value of farm property	Value of farm products
1850....	34,089	4,383,890	\$ 62,772,551
1860....	62,422	7,030,834	190,371,098
1870....	98,786	10,019,142	461,762,426
1880....	154,008	13,807,240	574,242,654	\$ 91,159,858
1890....	172,344	14,785,698	647,938,253	83,651,390
1900....	203,261	17,561,698	690,355,734	146,547,681

In 1900 the farm lands amounted to 47 per cent of the total area; and of this acreage 68 per cent was improved land. Most of the farming is in the Lower Peninsula. More than four fifths of the farms are cultivated by the owners; less than 5 per cent are operated by cash tenants, and but 11 per cent by share tenants. Cereals constitute the most important farm crops, contributing 45 per cent of the total value of crops in 1899. Corn is the leading crop, wheat ranks next in value, and oats third. Hay and forage yield nearly one fourth of the total value of farm crops. Vegetables are raised in large quantities; and the State leads in the pro-

	Acres	Quantities.	Value
Corn	1,501,189	44,584,130 bu.	\$17,798,011
Wheat	1,925,769	20,535,140 bu.	12,921,925
Oats	1,019,438	39,338,135 bu.	9,264,385
Rye	174,096	21,300,870 bu.	1,033,416

Buckwheat	55,669	605,830 bu.	306,311
Total cereals....	4,726,126	99,359,393 bu.	\$41,819,042
Hay and forage....	2,328,498	2,926,694 tons	\$21,792,987
Potatoes	311,980	23,478,686 bu.	6,761,750
Dry beans.....	167,025	1,806,413 bu.	2,361,020
Dry peas.....	71,376	1,134,431 bu.	689,133
Other vegetables..	57,713	3,075,595
Sugar beets.....	40,247	215,333 tons	877,481
Orchard fruits....	339,309	3,675,845
Small fruits.....	29,197	1,680,249
Grapes	10,465	503,268
Flowers and nursery products	2,124	899,231
Total, all crops...	8,091,791	\$92,625,715

duction of beans, peas, celery, chicory, and peppermint; is fourth in potatoes, and second in sugar beets. Fruit raising is a rapidly growing industry, especially in the southwestern part of the State, on the shores of Lake Michigan. Apples and peaches are the principal orchard products; but there are also large quantities of

pears and plums, as well as a considerable amount of grapes. In small fruits, Michigan ranks second among the States for its crop of strawberries, blackberries, currants, and raspberries. According to the last census, the leading crops in Michigan for the year 1899 were as in the preceding table.

Live Stock.—The live stock interests are extensive and steadily increasing. Horses and

	Number	Value
Horses	586,559	\$35,907,555
Dairy cows.....	563,905	17,281,805
Other neat cattle..	812,503	10,883,451
Sheep	1,625,930	5,227,343
Lambs	1,121,679	1,935,321
Swine	1,165,200	4,588,898
Fowls	8,403,060	2,685,849
All live stock.....	\$79,042,644
Wool	12,202,844 lbs.	\$12,202,844
Milk	309,617,046 gals.	} 16,903,087
Butter	60,051,908 lbs.	
Cheese	331,176 lbs.	} 6,104,462
Eggs	54,318,410 doz.	
Poultry raised....	4,551,945
Animals sold and slaughtered	23,677,642
All animal products	\$53,921,966

dairy cows are the most important animals; and there are large numbers of other neat cattle, sheep, and swine. The production of milk for 1899 was exceeded only by New York, Pennsylvania, and Ohio; and the State also stands high in the output of butter and eggs. In the production of wool, Michigan ranks second only to Ohio among the States east of the Mississippi. Statistics of live stock and animal products at the 12th census are given in the preceding table.

Manufactures.—While Michigan is not one of the most important States in the extent of its manufacturing industries, there has been a large growth in this direction during the last half century, and the State ranks tenth in the Union in the value of its manufactured products. The development is shown in the first table on following page.

The industrial development of the State has been marked by a steady diversification of its manufactures. The earliest, and for some time the only, industry of importance was the manufacture of lumber and timber products; and this still remains the leading manufacturing industry. With the decline of lumbering there has been some falling off in the value of crude lumber products; but the more intricate and specialized industries continue to develop. In particular the manufacture of furniture shows a large increase during the last decade; and Michigan ranks third among the States in this branch, as it does also in planing mill products. Second in importance among the groups of industries are those manufacturing food and kindred products, flour and grist mill products forming the principal branch of this group. Two minor food industries have received especial attention; the State ranks second in the production of beet sugar; and cereal and breakfast foods are manufactured in large quantities. Other industries of importance are iron and steel, other metals, car shops, chemicals and leather products. The table

MICHIGAN

	Number of establishments	Capital	Wage earners	Total wages	Cost of materials	Value of products
1850....	2,023	\$ 6,563,660	9,344	\$ 2,717,124	\$ 6,136,328	\$ 11,169,008
1860....	3,448	23,808,226	23,190	6,735,047	17,635,611	32,658,356
1870....	9,455	71,712,283	63,694	21,205,355	68,142,515	118,394,676

1900....	16,807	284,097,133	162,355	66,467,867	199,559,905	356,944,082

below gives statistics in reference to the leading groups of industries for the year 1900:

	Number of establishments	Wage earners	Capital	Value of products
Lumber products (including furniture)	2462	50,711	\$97,993,066	\$92,241,218
Food products... ..	1930	6,936	19,754,096	45,706,179
Iron and steel products	497	19,697	29,365,616	34,071,223
Other metal industries	556	3,975	6,235,490	25,556,939
Cars and carriages	393	14,057	19,427,093	28,465,773
Chemical products	272	7,509	20,606,900	20,017,746
Leather products..	593	3,483	7,868,718	10,474,838

There has been a moderate localization of manufacturing in the southern half of the Lower Peninsula. Detroit, located conveniently for lake navigation at the point of union between the railroads of the United States and Canada, is the largest manufacturing centre in the State; and leads especially in the manufacture of stoves, pharmaceutical chemicals, and tobacco. Grand Rapids is conspicuous as one of the great furniture centres of the world. Battle Creek is noted for its breakfast foods. Shipbuilding is carried on at Port Huron, Detroit, and Wyandotte. At Belding there are important silk interests.

Commerce.—Michigan has four ports of entry, Detroit, Port Huron, Grand Haven, and Marquette; and its proximity to Canada would make these important centres of foreign trade under favorable conditions. But under existing tariff laws the volume of foreign commerce is comparatively small. For the year ending 30 June 1902 the total exports from these Michigan ports were \$27,038,375, and the total imports were \$7,082,782. The internal and interstate commerce of the State is of vast and growing importance, especially the traffic on the Great Lakes. Lake commerce has been greatly promoted by improvements to navigation, and especially by the construction of ship canals at the falls of the Saint Mary's River, across the shallows at the head of Lake Saint Clair, and across the Keweenaw peninsula. The traffic through Saint Mary's Falls canal in the year 1902 was 35,064,251 tons of freight, four times the volume of freight through the Suez Canal. The most important items in this traffic were iron ore, 23,966,724 tons; grain, 96,160,313 bushels; flour, 8,469,085 barrels; and coal, 4,309,899 tons. Arrivals and clearances of vessels at Detroit in 1903 aggregated 4,534,000 tons.

Railroads.—The first railroads in Michigan were begun by the State government in 1836;

but these lines were sold in 1846 to private companies. In 1902 there were 8,300 miles of railroad in the State, extending to nearly every one of the 83 counties. The leading lines are the Michigan Central, the Lake Shore & Michigan Southern, the Chicago & Grand Trunk, and the Pere Marquette. In 1901, the railroads of Michigan carried 14,711,365 passengers, and 57,865,947 tons of freight; and their gross income was \$42,668,617. In 1902 there were 24 electric street railway companies in the State operating 1,083 miles of track. This includes local roads in most of the principal cities, and also interurban lines which have been extended rapidly within recent years. From Detroit it is possible to go by electric railway as far as Kalamazoo, Port Huron, or Bay City; while additional lines radiate from Grand Rapids and other cities.

Banking.—The first bank in Michigan was organized in Detroit in 1817. When the State was admitted to the Union in 1837 a period of wildcat banking ensued, which soon brought disaster. The State banks as well as the national banks are now on a sound basis; and the former are slightly more important than the latter, as is shown in the following table for 1902:

	No. of banks	Capital	Surplus	Loans and discounts
National banks..	87	\$12,161,000	\$3,209,652	\$59,434,000
State banks...	244	12,834,683	3,078,712	64,674,091
Private banks...	249	2,631,724	815,669
Loan and trust companies ...	5	1,350,000	704,000
Total	585	\$28,977,407	\$7,808,033

The exchanges for the year ending 30 Sept. 1902 at the clearing houses at Detroit and Grand Rapids amounted to \$656,262,020, an increase over the previous year of \$79,531,895. The State has also a large number of savings banks and trust companies.

Government.—Michigan has 12 representatives in the lower house of Congress, and two senators. It forms part of the sixth federal judicial circuit; and is divided into two federal judicial districts and two internal revenue districts. There are 2,200 post-offices in the State, 8 of the first class. The State legislature consists of a Senate of 32 members and a House of Representatives of 100 members, the whole membership being elected biennially. The regular session of each legislature begins on the first Wednesday in January of odd numbered years. The compensation of members is \$3 per day and mileage. The governor is elected for a term of two years and receives a salary of \$4,000 a year. Re-elections for a second term are frequent.

MICHIGAN

Other State officers are elected for the same term; and various commissioners and members of boards are appointed by the governor and senate. The supreme court consists of five justices, elected one every second year for ten years, at the spring election in April, when also are elected the regents of the State University. There are 38 State judicial circuits, each with one or more circuit judges, elected for a term of six years. County government is organized on the same plan as in New York, with a board of supervisors elected by townships and city wards. Sheriffs and other county officers are elected, in most instances for a term of two years. Township organization is unimportant, owing to the large number of villages and cities. There are 312 incorporated villages and 82 cities. Most of the latter are governed by special charters with nothing approaching a uniform system of organization. Amendments to the constitution are adopted on passing each house of the legislature by a two thirds vote, and afterward receiving a majority of the popular vote on the proposed amendment. Every 16 years the question of the general revision of the constitution is submitted to the electors. All male citizens of the United States who have resided in the State for six months, and in the ward or township for 20 days, are entitled to vote.

State Finances.—The first State Legislature authorized a loan of \$5,000,000 for public improvements; and in 1861 there was still \$2,316,328 outstanding. During the Civil War this debt was increased to \$3,880,399; but was steadily decreased and practically extinguished by 1890. In 1898, a loan of \$500,000 was made on account of the war with Spain; but by 1903 this debt was reduced to \$43,000. For the year ending 1 July 1903, the revenues and expenditures of the State Treasury (omitting bookkeeping transfers from one fund to another) were:

Balance, 1 July 1902.....	\$3,453,811
General taxes	\$3,726,191
Specific taxes (railroads).....	3,441,705
Sale of State lands.....	209,680
United States government.....	100,594
Miscellaneous	214,112
Total ordinary receipts.....	7,692,284
U. S. government (war claims refunded)....	385,152
Deposit accounts (temporary).....	373,393
	<hr/>
	\$11,904,640
Total disbursements	7,387,535
Balance, 30 June 1903.....	\$ 4,517,105

Since 1899 through the efforts of the State Tax Commission, the assessed valuation of property has been increased from \$968,189,087 to \$1,537,355,738 in 1903. The total taxation levied on this for the last named year by the different administrative districts was as follows:

State tax	\$ 4,003,255
County taxes	3,373,083
Township taxes	5,873,127
Highway labor taxes.....	1,215,525
Village taxes	1,022,035
City taxes	10,511,992
Total	<hr/>
	\$25,999,017

Charities and Correction.—The State maintains five insane hospitals, at Kalamazoo (established 1848), Pontiac, Traverse City, Newberry, and Ionia, the last named for the criminal insane. In 1902 these institutions held property valued at

\$3,725,000, the number of patients was 4,630, and the annual expense \$1,142,000. There is also a home for the feeble-minded and epileptic at Lapeer, and a Soldiers' Home at Grand Rapids. There is also a State school for the deaf and dumb at Flint, a school for the blind and an industrial school for boys at Lansing, an industrial home for girls at Adrian, and a school for neglected and dependent children at Coldwater, the last named the first of the kind in the United States. Correctional institutions consist of State prisons at Jackson and Marquette, and a reformatory at Ionia, with a total of 1,359 inmates in 1902. The expenditures for that year were \$245,000, and the receipts from prison industries \$138,000. The indeterminate sentence has recently been adopted in Michigan. Each of these institutions is under the management of a separate board of unpaid trustees. An unsalaried State Board of Charities and Correction, appointed by the governor and senate, inspects both state and local institutions.

Education.—In 1901 there were 7,171 school districts, 16,504 teachers and 8,066 school buildings, the property aggregating \$20,000,000. Out of 730,101 children between 5 and 20 years of age, 510,031 were enrolled in the schools. There were 261 public high schools and 445 private schools. The total public school revenue in 1901 was \$8,890,000; and \$4,736,779 was paid in salaries to teachers and superintendents. Only 4 per cent of the population is classed as illiterate. The State maintains four normal schools, and three institutions for higher education,—the University of Michigan (q.v.) at Ann Arbor, the Agricultural College at Lansing, and the College of Mines at Houghton. There are nine private colleges in the State, at Adrian, Albion, Alma, Battle Creek, Detroit, Hillsdale, Holland (Hope College), Kalamazoo, and Olivet. Besides the State library at Lansing and the University library at Ann Arbor, there are large public libraries in Detroit, Grand Rapids, and other cities. The newspaper press is well developed. The first was established at Detroit in 1817; and there are now over 800 newspapers and periodicals, of which 80 are issued daily, 600 weekly and 85 monthly.

Churches.—The Roman Catholic Church has the largest number of communicants. Of the Protestant denominations, the Methodist Episcopal Church is first, and the Lutheran second; while the Baptist, Presbyterian, Congregational, and Protestant Episcopal follow in the order named; and the German Reformed, United Brethren, Disciples of Christ, and Adventists have also considerable numbers. In 1890 there were 4,798 church organizations, with 3,761 buildings and 569,504 members, and property valued at \$18,682,971.

History.—Some reminders of prehistoric races are to be found in Michigan in deserted copper mines at Isle Royale, and other signs of human occupation, assigned to the mound builders (q.v.). The Indians who occupied the region in historic times were mostly Hurons or Wyandots, who were in almost constant conflict with the Iroquois confederacy. The first white men who visited the Michigan country came from the French settlements in Canada by way of the Ottawa River, early in the 17th century. It is known that Jean Nicolet, vanguard of the

MICHIGAN

Jesuit missionaries, penetrated as far as central Wisconsin in 1634; and it is supposed that other explorers had come still earlier. The first permanent white settlements were Jesuit missions established by Father Marquette at Sault Ste. Marie and Michilimackinac in 1668 and 1670. A French colony was founded at Detroit in 1701 by Antoine de la Motte Cadillac (q.v.). During the French and Indian war, these settlements in Michigan were surrendered to the British (1760) as part of Canada. In 1763 the Indians rose under Chief Pontiac and after the massacre of Mackinaw laid siege to Detroit for nearly a year, but were finally defeated. The Quebec Act (q.v.) of 1774 for the government of Canada applied to Michigan. During the Revolution the British officers at Detroit encouraged Indian expeditions which harassed the settlements in Ohio and Kentucky; and even after the peace of 1783 there was much trouble with the Indians until 1795, when they were brought to terms by General Wayne. By the treaty of peace, they ceded large tracts of land in Michigan to the United States. It was not until 1 July 1796 that the British troops surrendered possession of Detroit to the United States. The Michigan settlements then came under the government of the Northwest Territory. In 1802 the country was made a part of Indiana Territory; and in 1805 the Lower Peninsula was organized as Michigan Territory, with General Hull as governor. During the War of 1812 Detroit and Frenchtown were surrendered to the British, and at the latter place many prisoners and inhabitants were massacred by the Indians (See FRENCHTOWN MASSACRE). After the battle of Lake Erie (1814) the United States again came into possession of Michigan; and Lewis Cass began his long career as governor of the territory, which continued until 1831. With the final abandonment of Michigan by the British, the Indians acknowledged American supremacy; and from 1814 to 1835 ceded large tracts of land to the United States. The completion of the Erie Canal across New York State in 1825 opened a new route to Michigan, and population increased rapidly. In 1837, after a bitter struggle over the southern boundary, Michigan was finally admitted to the Union, the Upper Peninsula being added to the State as compensation for the loss of the strip claimed from Ohio.

The new State at once undertook to build three lines of railroad across the Lower Peninsula; but the plans failed and in 1846 the roads were sold to private corporations. In 1847 the State capital was removed from Detroit to Lansing. A second State constitution was adopted in 1850. During the Civil War Michigan sent her full quota of troops to the front; and many of them became famous as soldiers and sailors. Austin Blair was governor during the war period. The State had prohibited the sale of liquor in 1855; but in 1876 the prohibition law was repealed, and a license tax substituted, which has since been raised to a high figure. In 1881 the United States ship canal around Saint Mary's Falls was completed, paving the way for the rapid development of the mining resources of the Upper Peninsula. In 1889 the Australian ballot was adopted. The question of a general revision of the State constitution was voted on in 1892, and again

in 1898; but on both occasions failed to secure the required vote. Many amendments to the constitution have, however, been adopted from time to time. In recent years the most important legislation has been that dealing with taxation, especially of corporations. In politics Michigan was Democratic with the exception of two elections until 1854; and it has been Republican since, with but three exceptions—in 1882 and 1883 fusion Democratic-Greenback tickets, and in 1890 the Democratic party were successful. Among the leading Michigan men in public life may be noted:—Lewis Cass, who after his long service as governor of the territory, filled positions in the cabinets of two Presidents, was senator for two terms (1845-57) and a candidate for President of the United States; Zachariah Chandler, senator for three terms (1857-75), and secretary of the interior; James V. Campbell, justice of the Supreme Court from 1858 until his death in 1890; and Thomas M. Cooley, justice of the Supreme Court from 1864 to 1885, and chairman of the Interstate Commerce Commission.

Population.—In 1810 the population of Michigan was 4,762; (1830) 31,639; (1840) 212,267; (1850) 397,654; (1870) 1,184,059; (1890) 2,093,890; (1900) 2,420,982. It will be seen that rapid settlement began after 1830; while since 1870 the increase has been at about the same rate as the United States as a whole, and during these 30 years Michigan has been the ninth State in population. The early settlers were largely from New York and New England. Since 1850 there has been a large immigration of foreigners, mostly Canadians and Germans; while there have also been considerable numbers from Holland, Ireland, and Poland. In 1900 the total foreign born population was 521,653, a larger proportion than in any other State in the Northwest Territory, except Wisconsin. Of those born in the United States 831,653 had one or both parents of foreign birth, leaving less than half (43 per cent) of the population born of native parents. Most of the population is in the Lower Peninsula; and only 261,362 (about one ninth) are in the Upper Peninsula. Urban population is about the same proportion in Michigan as in the United States as a whole; 60.7 per cent of the population live in the country districts, and 31 per cent in cities of over 8,000. The principal cities are Detroit, 285,704; Grand Rapids, 87,565; Saginaw, 42,345; Bay City, 27,628; Jackson, 25,180; Kalamazoo, 24,404; Muskegon, 20,818; Port Huron, 19,158; Battle Creek, 18,563; Lansing, 16,485; and Ann Arbor, 14,509. Other cities of importance are Manistee, Ishpeming, Flint, Menominee, West Bay City, Sault Sainte Marie, and Marquette.

JOHN A. FAIRLIE,
University of Michigan.

MICHIGAN

Michigan, Lake, in the northern part of the United States, the second in size of the Great Lakes (q.v.), and the largest body of fresh water lying wholly within the United States. It is bounded on the north and east by the State of Michigan, on the south by Indiana, and on the west by Illinois and Wisconsin. Its outlet is Straits of Mackinac, through which its waters flow into Lake Huron (q.v.). The Mississippi is supposed to have been its outlet, in ancient times; and now the Lake is connected with this river by means of the Chicago Drainage Canal (q.v.) and the Illinois and Michigan Canal. Lake Michigan is a most important part of a great water system which furnishes transportation to the ocean for an extensive grain-growing and lumbering region. The Lake is 581 feet above sea level; its length from north to south is about 300 miles; the average width, 75 miles, the average depth 870 feet; area, 22,450 square miles. It is subject to violent storms, which are most destructive in the late autumn months. A lunar tidal wave shows itself in a slight degree. The shore-line of the southern part of the Lake, east and west, is regular, but that of the northern part, east and west, has a number of indentations many of which form good harbors. At the mouths of rivers which flow into the Lake there are good harbors. Nearly the whole extent of coast is low, most of it sandy; the Michigan coast has some high bluffs and considerable rocky shore-line. Green Bay on the west, indenting Wisconsin, is the largest bay, and Grand Travers Bay, on the east indenting the coast of Michigan is the next in size. Another important inlet on the east is Little Travers Bay. Big Noquet and Little Noquet are inlets from Green Bay. The chief harbors, which are formed by mouths of rivers, are Chicago, Milwaukee, and Grand Haven. Escanaba and several other good harbors are on the shores of Green Bay (q.v.). There are few islands in the southern part of the Lake, all small and near the coast. At the entrance to Green Bay there is a group of islands, the largest of which is Washington. The Manitou (q.v.) group, in the northern and northeastern part of the Lake, has several good-sized islands; the largest, Beaver, is about 52 miles long.

The chief rivers which flow into the Lake are the Ford, Escanaba, and Manistique from the north; the Manistee, Pere Marquette, Muskegon, Grand, Kalamazoo, and St. Joseph from the east. The Fox and the Menominee enter the Lake through Green Bay.

The chief cities on the Lake are Chicago in Illinois, and Milwaukee in Wisconsin. Other important cities are Kenosha, Racine, and Manitowoc (Wis.), Manistee, Ludington, and Grand Haven (Mich.), and Michigan City (Ill.). The navigation on Lake Michigan is most extensive and important. In the upper waters, or the southern part, navigation continues nearly all the year, but in the northern part navigation is closed about four months on account of the ice in the Straits of Mackinac. Large shipments of lumber are sent by way of the Lake from northern Michigan and Wisconsin to Milwaukee and Chicago, and a vast amount of the wheat and corn of the Mississippi Valley is sent east through Chicago and over Lake Michigan. The fisheries of the Lake are most important. The lake trout and whitefish of Lake Michigan are

sent, fresh and canned, to all the large markets of the vicinity and to the Eastern markets.

The early missionaries and traders traversed the waters of this Lake. In 1634, Jean Nicolet, an agent of Champlain (q.v.), visited the northern part of the Lake, entered Green Bay, and partially explored the Fox River. Father Marquette (q.v.) visited this Lake and established mission stations on its shores. La Salle (q.v.) and Father Hennepin (q.v.) in 1679 made their famous voyage on this Lake, and La Salle built a fort at the mouth of the St. Joseph River.

Michigan, University of, chartered in 1837, and first opened at Ann Arbor in 1841. It is a part of the public educational system of the State, and is under the control of a board of regents, elected for eight years by popular vote. The law of 1837 establishing the University provided for three departments, namely, Literature, Science and Art, Law and Medicine. The curriculum has since been enlarged, till the organization now includes seven departments: (1) Literature, Science and Arts; (2) Engineering; (3) Medicine and Surgery; (4) Law; (5) The School of Pharmacy; (6) The Homœopathic Medical College, and (7) The College of Dental Surgery. The Department of Literature, Science and Art offers courses in language and literature, history, philosophy, science, and the liberal arts, and includes a graduate school; the degrees conferred are bachelor of arts, master of arts, doctor of philosophy, and doctor of science. The Department of Engineering offers courses in civil, chemical, mechanical, electrical, and marine engineering, and confers the degrees of bachelor of science, master of science, and civil engineer, mechanical engineer, and electrical engineer. Other degrees conferred by the University are as follows: Doctor of medicine in the Department of Medicine and Surgery, and in the Homœopathic Medical College; bachelor of laws and master of laws in the Department of Law; pharmaceutical chemist, also bachelor of science and master of science (in pharmacy), in the College of Pharmacy; and doctor of dental surgery and doctor of dental science in the College of Dental Surgery.

There are summer sessions in the departments of Literature, Science and Art, of Medicine, and of Law.

The regulation of the affairs of each department is in the hands of the faculty of that department; there is also a University Senate which considers matters of common interest. The standard of scholarship at the University is high, and it has long ranked among the foremost of State universities. It is distinguished as a pioneer in adopting the principle of co-education, being opened to women in 1870, and giving them equal privileges in all respects; this system has proved very successful since the first, and has never incurred serious adverse criticism. The dormitory system adopted at first was discarded early in the history of the institution, and the University now has no dormitories and no commons. Besides the halls and laboratories of the different departments, the important buildings are the library, the museum, the main observatory, and the two gymnasiums, one for men, and one for women. The University has a number of valuable collections in natural history, archaeology, ethnology, materia medica, anatomy, and the industrial and fine arts; in the library build-

MICHIGAN CITY — MICHOCAN

ing is the Chinese government exhibit at the New Orleans Exposition, presented to the University in 1885. The general library in 1903 numbered over 130,000 volumes, not including pamphlets; special libraries also belonging to the University are the medical library (12,000 volumes), the law library (19,600 volumes), the homœopathic library, and the dental library; of these, the two medical libraries are shelved in the general library building; the other two are in the buildings of their respective departments. The main observatory, erected by the citizens of Detroit and known as the Detroit Observatory, contains a meridian circle constructed by Pistor and Martins of Berlin, and a refracting telescope with an object-glass of 13 inches diameter; there is also a small observatory near this main building, containing a 6-inch equatorial telescope. Two hospitals are connected with the University, one under the direction of the Department of Medicine and Surgery, the other under the charge of the Homœopathic Medical College; with each of these is connected a training school for nurses. Ample provision is made for physical culture and athletics; besides the two well-equipped gymnasiums, already mentioned, there is an athletic field of 30 acres; the general supervision of athletic sports is vested in a board of control of nine members, on which the faculty is represented by five members chosen from the University senate, and the students by four members chosen by the directors of the Students' Athletic Association. Important among student organizations is the University Oratorical Association, established by the students of the Department of Literature, Science and Art to foster an interest in oratory and debate; this association is affiliated with the Northern Oratorical League, composed of similar associations of the universities of Iowa, Minnesota, Wisconsin, Chicago, and Oberlin College and Northwestern University; and with the Central Debating League, in which the universities of Chicago and Wisconsin, and Northwestern University are also represented. In 1903 the total income was \$741,000, including the State appropriation; the fees to students are small, being somewhat less for residents of the State than for non-residents. In 1903 the number of students was 3,529; including the summer session, 3,792; president, James B. Angell (appointed 1871).

Michigan City, Ind., city in Laporte County; on Lake Michigan, and on the Chicago, I. & L., the Michigan C., and the Lake E. & W. R.R.'s; about 40 miles east of Chicago. The place was visited frequently in the 18th century by missionaries, explorers, and traders, but the first permanent settlement was made in 1833. The incorporation was made in 1837. It has excellent transportation facilities which contribute to its commercial and industrial growth. Its chief manufactures are hosiery, knit underwear, chairs, lumber, railroad cars, and furniture. It has a large trade in iron ore, salt, lumber, and farm products. It has the Northern Indiana State Prison, a United States life-saving station, and on the lake front a park. Its educational institutions are a high school, public and parish schools, and a public library.

The city is governed under a charter of 1867, since amended, which provides for a mayor, elected biennially, and a common council. The

administrative officials are elected by the council or appointed by the mayor subject to the approval of the council. The waterworks are owned and operated by the city. Pop. (1890) 10,776; (1900) 14,850.

Michigan College of Mines, at Houghton (q.v.) in the State of Michigan, was founded in 1885 and opened in 1886. The school is located in the midst of the mining region of the State, thus giving the students exceptional opportunities for observation and study. Practical work in mine surveying and mining is carried on for five weeks, forty-five hours each week. The first two weeks are devoted to surveying and mapping a mine in the "copper country" or in the iron mining district; the last three weeks are given to the examination of mining methods, and to making sketches of mines in the vicinity. The courses of study lead to the degrees of Bachelor of Science and Engineer of Mines.

The school is well equipped with all necessary apparatus. The metallurgical and assay laboratory is a brick building; and the ore-dressing building, or stamp mill, is a wooden building. A reverberatory roasting furnace stands near the mill.

Michigan State Agricultural College, chartered in 1855, and opened in 1857, situated at Lansing. It was the first institution for agricultural education established in the United States. The Michigan State constitution provided that "The legislature shall as soon as practicable provide for the establishment of an agricultural school." In 1850 the legislature petitioned Congress for a grant of land for an agricultural college within the State, but no attention was paid to this petition. In 1855, however, the legislature appropriated land and money for such a college, and located it on a farm of 684 acres. From that time until 1862 the college was supported by State appropriations; and in that year received control of the Federal land grant. The courses offered in the college include the full four years' courses in agriculture, mechanical engineering, and domestic science; and short courses (varying from four to twelve weeks) in chemistry, beet sugar production, cheese making, dairy husbandry, creamery management, live-stock husbandry, and fruit culture; graduate work is also provided for. The college organizes Farmers' Institutes throughout the State, which are under the supervision of members of the faculty; in 1901, 204 institutes, with an attendance of 84,780, were held. The experiment station is also connected with the college, and receives a separate Federal appropriation of \$15,000 annually. Women are admitted to all courses, but form a small proportion of the graduates. The farm (1903) consists of 684 acres, and the buildings are valued at \$440,000. The library in 1903 contained 24,003 volumes. The income for that year was \$260,000; the students numbered 854, and the faculty 60.

Michipicoten, mîsh-ê-pê-kô'tên a bay in the western part of the province of Ontario, in Canada. It is an arm of Lake Superior, on the northeast shore; about 100 miles north of Sault Ste. Marie. At the entrance to the bay is Michipicoten Island.

Michoacan, mē-chō-ā-kān', Mexico, a state, on the Pacific Ocean; bounded on the north by the states of Guanajuato and Jalisco,

MICKEY — MICRONESIA

on the east by Mexico, on the south by Guerro and the Pacific, and on the west by the Pacific, Colima, and Jalisco. Area, 22,874 square miles. Two railroad lines cross the state. The surface generally is mountainous; in the north and south are some flat lands. The volcano of Jorullo is in the southwest. The largest drainage streams are Las Balsas and Lerma on the boundary, and the Tepalcatepec. There are a number of lakes within the state limits, the largest of which is Cuitzeo. Except where the lands are low the climate is healthful. The soil is fertile; the principal crops are sugar, tobacco, vanilla, wheat, rice, and tropical fruits. Considerable attention is given to stock-raising, and mining is carried on to some extent. The minerals are valuable. The capital is Morelia. Pop. (1900) 37,278. Pop. of state (1895) 887,008; (1900) 935,849.

Mickey, John Hopwood, American politician: b. near Burlington, Iowa, 30 Sept. 1845. He was educated in the Iowa Wesleyan University, and in 1863-5 served in the Iowa cavalry in the Civil War. He engaged in banking in 1879 and was a member of the Nebraska legislature in 1881-2. In 1902 he was elected governor of Nebraska.

Mickiewicz, mīts-kē-ěv'īn, Adam Bernard, Polish poet: b. Novogródek, Lithuania, 24 Dec. 1798; d. Constantinople 26 Nov. 1855. He was educated at the University of Wilna, where he became affiliated with several of the leaders against Russian control. His first volume of poems appeared in 1822 and stamped him the greatest poet of his country. Implication in political affairs caused his banishment to Russia in 1824, but in 1828 permission to leave Russia was granted him and he traveled in Germany and Italy, and in 1834 he went to Paris, where, in 1840, he became professor of Slavonic language and literature in the Collège de France. Among his works are: 'Conrad Wallenrod' (1838); 'Crimean Sonnets' (1826); 'The Books of the Polish People and of the Polish Pilgrimage' (1832); 'Pan Tadeusz' (1834); etc. See L. de Loménie, 'Galerie des Contemporaines.'

Mickle, mīk'l, William Julius, Scottish poet: b. Langholm, Dumfriesshire, Scotland, 28 Sept. 1735; d. Forest Hill, near Oxford, 28 Oct. 1788. He removed to London in 1764, and in 1775 appeared his principal production, a translation of the 'Lusiad' of Camoens, with a historical and critical introduction, including a life of Camoens. His poetical works were published collectively, with memoir by Sim, in 1806. Among the best of Mickle's poems is the ballad of Cummor Hall, which has attained additional celebrity as having suggested to Sir Walter Scott the groundwork of his novel of 'Kenilworth.' The popular song, 'There's nae Luck about the Hoose,' has been claimed for him; others ascribe it to Mrs. Jean Adams, schoolmistress, near Greenock.

Micmacs, mīk'māks, a tribe of American Indians. See ALGONQUIAN.

Microbe (Greek *μικρός*, little; *βίος*, life), a microscopic organism; applied particularly to bacteria, and more especially to the pathogenic forms. See BACTERIA.

Microcosm and Macrocosm. Among the ancients a belief prevailed that the world or cosmos was animated, or had a soul. This theory led to the notion that the parts and mem-

bers of organic beings must have their counterparts in the members of the cosmos. The natural philosophers of the 16th century took up this theory in a somewhat modified shape, and considered the world as a human organism on the large scale, and man as a world, or cosmos, in miniature; hence they called man a microcosm (Greek, 'little world') and the universe itself the macrocosm ('great world'). Heylin gave the title 'Microcosmus' to a work on cosmography in 1621.

Microcosmic Salt, used in blowpipe analysis; prepared by mixing concentrated solutions of phosphate of soda and chloride of ammonium. It has the composition $\text{NaNH}_4\text{HPO}_4 \cdot 4\text{H}_2\text{O}$.

Microles'tes. See PLAGIAULACIDÆ.

Microlite (Greek, "small"), a native pyro-tantalate of calcium, containing fluorine, and also niobium, and various other bases. The formula has not yet been satisfactorily determined. Microlite crystallizes in octahedral forms belonging to the isometric system, and the crystals are often very small. It was first found at Chesterfield, Mass., where the crystals were so minute as to suggest the name "microlite." Excellent crystals as much as an inch in diameter have since been found in Amelia County, Va., as well as imperfect ones weighing as much as four pounds. The mineral is usually yellow or brown in color, with a resinous lustre, a hardness of 5.5, and a specific gravity of from 5.5 to 6.1.

Micrometer, an instrument for measuring minute angles and distances. The "double-image micrometer" is of importance in measuring the diameter of a celestial object; it is an eye-piece containing two halves of a lens, each half being movable by a micrometer screw (q.v.) in a direction parallel to the common diameter. When the halves form one lens the heads of the screws indicate zero. In making an observation of the diameter of a heavenly body the half-lenses are so moved that the image formed by one of them of one limb of the body coincides with the image of the opposite limb formed by the other half-lens; the readings of the screw-heads determine the apparent diameter of the body.

Micrometer Screw, in optics, a screw attached to instruments for exact measurement of very small angles. The great space through which the lever of the screw passes, in comparison with the longitudinal motion due to the pitch, affords the means for a positive motion which is imperceptible on the object moved, though appreciable in its results.

Micron, mī'kron (Greek, "very small"), a unit of length equal to the millionth part of a metre, or the 25,400th part of an inch. It is much used among physicists in connection with precise measurements, and has been officially sanctioned by the International Commission of Weights and Measures. The Greek letter μ is used as its symbol. Thus "47 μ " is read "47 microns." The names "bicon" and "tricon" have been proposed, respectively, for the billionth and trillionth part of a metre, but they have not been generally adopted, and probably will not be. Etymologically, at least, they are monstrosities.

Micronesia, mī-krō-nē'shī-a, the name giver to a large number of islands in the Pacific Ocean,

MICROPHONE—MICROSCOPE

the natives of which have a light skin as distinguished from Melanesia (q.v.), the inhabitants of which are dark-skinned. The islands extend southward from Japan to New Guinea, the chief groups comprising the Gilbert Islands, Marshall Islands, Carolines, Pelew Islands, and Ladrões (qq.v.).

Microphone, an ingenious instrument, the invention of Professor Hughes (1878), whereby minute sounds can be transmitted in an intensified manner by means of electricity, the whole arrangement consisting of a transmitter and a receiver with a small voltaic battery and wires in circuit. Not only can ordinary sounds be transmitted, but musical sounds, singing, breathing, and conversation can be readily transmitted. And not only are sounds transmitted, but slight sounds are transmitted greatly increased in volume, the gentle touch of a feather or a camel's-hair pencil reaching the ear like the rasping of a file, while the scratch of a quill-pen in the act of writing is augmented to a loud noise. Even the tramp of a fly is distinctly audible.

Microsau'ri, an order of *Prosauria*. See **HERPETOLOGY**.

Microscope, an optical instrument by which objects are so magnified that details invisible or indistinct to the naked eye are clearly observed. In the ordinary microscope the magnifying power is interposed directly between the eye and the object, in the manner of a magnifying glass; and although the power may consist of several lenses, they combine as one.

The microscope was invented between 1590 and 1609—the honors being divided between Hans and Zacharias Janssen, two Hollanders, and that greatest of early opticians, Galileo. From its early form, consisting simply of a double or plano-convex object lens with an eyepiece of a single convex lens to magnify the image, it developed by gradual stages until the latter part of the 18th century, without becoming much more than a toy for the amusement of the dilettante. As a matter of fact nearly every form of accessory which is in use at the present time was devised and used in some form, but the desire for the ornamental and extraordinary rather than the practical was everywhere manifest. With the awakening of general interest in scientific investigation, the microscope began to be used as a tool to accomplish heretofore impossible results. This led to more practical forms of construction, and at last to their production in large quantities and at a cost which placed them within the reach of laboratories and individuals. Among the early American pioneers in the optical improvement of the microscope, the names of Robert Tolles and the two Spencers stand prominent. By their extraordinary manual skill and knowledge of optical principles, they succeeded in producing lenses which, in the case of one by Tolles had a focal length of 1-75 inch, the highest power objective which has ever been constructed. The resolving power of microscope lenses was greatly increased and the problems of their manufacture materially simplified by the invention by Tolles of his "duplex front" objective, a construction which was voted impractical by the experts of the time, but which has since superseded all others in the construction of high power lenses.

The microscope is used as a necessary accessory in a large number of the sciences and in many industries. It is, primarily, the assistant of the teacher of biology, botany, bacteriology, histology, pathology and the allied branches of science. The medical profession employs it in the examination of the urine, blood and of cancerous and tumorous growths, as well as in searching for the parasites of the body, fungi which infest the hair and skin and for diagnosing febrile diseases. For the examination of steel, iron and other metals to determine their intimate structure, the microscope is extensively used. Its use for the detection of adulterations in foods, drugs, paints, earths, starches, and many other substances is often the only effective method of working. The bureau of animal industry of the United States Government depends wholly on the microscope for the detection of living parasites in the flesh of animals slaughtered for food. The microscope is used in many industries for counting fine lines, threads, and fibres, and for determining the physical structure of cements, emulsions and other substances. The finest possible measurements of space are made with the microscope to which a filar micrometer is applied, and with it the rate of growth in plants is determined.

FIG. 1.

Microscopes are divided into two classes—simple and compound, the former being confined to limited magnifications, rarely exceeding 20 diameters, whereas the latter may give as high as 4,000 diameters magnification. In the simple form the eye views the object directly (Fig. 1), whereas, in the compound form an enlarged image is formed by one lens, which image is magnified by another lens or pair of lenses, at the same time reversing it so that what is right in the object is left in the image. (Fig. 2.) A short focus positive lens becomes a simple microscope when used for viewing an object; its usual form is that of the Pocket Magnifier, and although generally consisting of more than one lens, either for improving its quality or to obtain a variety of powers, it always remains optically simple. The most simple forms are one or several single convex lenses, the latter offering a variety of foci. These lenses have two defects, one, chromatic aberration, which fringes the images with the colors of the spectrum, most noticeably red and blue, the other, spherical aberration, which is most noticeable by the increasing lack of distinctness toward the edge of the field. Improved forms are constructed to overcome these defects. The most simple of these is the Coddington, originally a section of a sphere, but as generally made, a thick double convex lens with a circular groove which acts

MICROSCOPE

as a diaphragm. The achromatic lens when composed of three lenses (triplet), two concave convex flint glass lenses enclosing and cemented to a double convex crown glass lens, is the best form. These are usually placed in a folding mounting for pocket use. The simple micro-

FIG. 2.

scope is also made in more complex form for dissecting purposes, a mechanical construction, more or less elaborate, being added, which provides adjustment for the lens in relation to the object, a platform or stage for the latter, and a mirror for reflecting light to illuminate the object. (Fig. 3.)

FIG. 3.—Dissecting microscope.

In the compound microscope the lens which gives the first magnified image is the one nearest the object, and therefore called object-glass or objective. The optical part which magnifies the

image formed by the objective is the one to which the eye is applied and is called the eye-piece or ocular. This latter, in its usual form, is called Huyghenian, after Huyghens, who used it in the earliest and most primitive telescope construction. It consists of two plano-convex lenses, suitably mounted in brass, the lower lens being called the field lens, the upper one the eye lens. It is a negative eye-piece, as its focus lies within itself, a diaphragm, which limits the field of vision being placed at this point. The magnification of the compound microscope (Fig. 4) depends upon three conditions: (1) The power of the object-glass, (2) the power of the eye-piece, (3) the amount of separation of these two optical parts. If the focus of the object-glass is reduced, the power is increased, and the same holds true with the eye-piece. The more the objective and eye-piece are separated, the greater will be the power. It will ap-

FIG. 4.—Compound microscope.

pear from this statement, therefore, that the magnification of the microscope is unlimited, but the mere magnification of an object is less sought after and is of less value in the modern microscope than its power to disclose detail and structure. The length of tube which connects the eye-piece and objective is limited to from six to eight inches, for the sake of convenience in use. The standard length of the microscope tube must be closely adhered to or else the optical capacity (correction) of the objective will be disturbed. The power of the eye-piece rarely exceeds 15 diameters and that of the objective 150 diameters. A convex lens of one inch focus gives a magnification of about 10 diameters at a distance of 10 inches, and this holds true of a combination of lenses of this

MICROSCOPE

equivalent focus as in the eye-piece. If therefore a one-inch focus eye-piece is 10 inches distant from a one-inch objective, the magnifying power is $10 \times 10 = 100$ diameters; or, if 5 inches distant, is one half as great, or 50 diameters. The designation of power is according to the focus of a single lens having the same magnifying power as the series or combination of lenses which make up the objective as well as eye-piece. As the image of the objective is magnified by the eye-piece, it is evident that any defect in the objective is magnified to the same extent, and unless eliminated would seriously interfere with obtaining a distinct image. The main problem, therefore, remains to convey through the objective as many image-giving rays, free from defects, as possible. As a matter of fact, objectives, whatever their power, are composed of a series of lenses whose purpose it is to correct errors which would exist if single lenses alone were used, and the greater the power of the objective, the larger the number of lenses required. In the low powers there are generally two systems of lenses, each of which is an achromatic doublet; in the medium powers the principal magnification is obtained by a single front or hemispherical lens and two systems of cemented and corrected lenses; in the

ordinary way in the very high powers, it is necessary to construct them for immersion contact with the object, and they are then termed "immersion objectives." The highest power in general use is the 1-12 inch focus, the medium powers are $\frac{1}{8}$ to $\frac{1}{4}$ inch and the low powers from 1 to $\frac{3}{4}$ inch.

To properly adjust the optical parts which have a fixed relation to one another by means of a tube (body) and to hold the object in its proper position in relation to them involves certain mechanical appliances which provide stability, convenience of adjustment and illumination: a rack and pinion provides coarse adjustment and a micrometer screw fine adjustment; both are extremely delicate; the stage or platform for placing the object, and mirror beneath the stage for reflecting abundant light and a base for stability. This aggregate of mechanical parts is called the "stand." The collar at the end of the tube to which the object glass is applied is the nose-piece; double and triple nose-pieces are also made to take two and three objectives, which may be rotated and focused on the object in turn. A mechanical stage provides delicate means of adjusting the object in place of the hands. The high powers require more than the usual amount of light for illumination and a condenser gathers it from the mirror and concentrates it upon the object. Micrometers are provided to determine the amount of magnification and measure the actual size of an object. A camera lucida is made to project the magnified image upon a sheet of paper on the table to facilitate its drawing. Beside the microscope with single tube, there is another in which the rays from the objective are bi-sectioned and diverted into a second tube, so that the object may be viewed with both eyes. This is the binocular microscope and with low power objectives gives a beautiful stereoscopic effect. So far as our knowledge of the action of light and the constitution of visual images goes, the best microscopes now made realize about the limit to which the seeing powers of the instrument can be brought, although experiments with especially controlled illumination, now in progress, may result in advancement in this direction. Nevertheless the field of research and discovery into which the microscope has as yet not penetrated, and which are within its powers, are almost unlimited.

The use of the microscope for photography also embraces an extremely wide and useful field. Photographs of minute objects enlarged as much as 5,000 diameters (25,000,000 areas) can be produced in this manner, and a permanent record made which can also be used for reproduction by the usual printing processes for the illustration of books, etc. Recently the movements of insects and other small creatures have been reproduced by a biographic microscope, and living pictures of the unseen world are now presented to audiences as a means of amusement.

FIG. 6.—A high power (1-12") microscope objective of four systems.

high powers it is usual to employ two superposed hemispherical lenses, adding thereto two corrected combinations. As may be supposed the production of these lenses and setting them in mountings involves the most accurate processes. First of all the various kinds of glass must have fixed and prescribed properties and be of absolute homogeneity and freedom from blemishes. The production of such glass is in itself a laborious and delicate process. The lenses must be accurately ground and polished to absolutely correct spherical surfaces, truly centred and cemented, then set in suitable mountings without strain at absolutely correct distance and the axes of all in alignment. The efficiency of an objective to gather up rays emanating from an object and form a perfect image is termed the angular or numerical aperture and the extent of it really determines the visibility of detail, correction for chromatic and spherical aberration being presupposed. It is only with the increase of power in objectives that it is possible to increase the numerical aperture. On account of the loss of light and inability to obtain sufficient angular aperture in

MICROSCOPICAL SOCIETY — MIDAS

Microscopical Society, The American.
See AMERICAN MICROSCOPICAL SOCIETY, THE.

Microscopium, in astronomy, one of the 14 constellations which Lacaille added to the heavens in connection with his work at the Cape of Good Hope. It is a very inconspicuous constellation, its brightest star being of only 5.1 magnitude.

Microscopy, Clinical, the use of the microscope in the diagnosis of disease. The microscope, ever since its first construction, has been used in the study of disease processes, but only within comparatively recent years has it attained its present importance as an adjunct in the clinical diagnosis of many different types of disease. Owing to the development of knowledge of parasitic and infectious diseases, the physician of to-day is better able to make an accurate diagnosis by means of the microscope than were his forefathers. The microscope may be used not only to confirm a diagnosis which has been made by ordinary clinical methods, but it may abbreviate such clinical examination, or by it a diagnosis may be made without such preliminary examination. Thus at the present time consumption of the lungs may be microscopically diagnosed by an examination of the sputum, though the patient be 1,000 miles away, and in the same manner a number of diseases of allied forms may be recognized by certain minute evidences interpretable by the microscope.

The most important of the intestinal parasites that can be thus identified are the tapeworm, roundworm, hook-worm, fluke-worm, and pin-worm. In all of these the physician of the present time, by a microscopical examination of the feces, can detect the presence of the eggs of the different kinds of worms and make a definite diagnosis. It is not necessary for parents to guess at the presence of worms and to treat their children "on suspicion." The presence or absence of worms can be accurately and definitely determined by a competent microscopist. Not only can a diagnosis of worms in general be made, but the precise kind of worm can be known by the characteristic configuration of the eggs. Examination of the feces by the microscope can further detect various forms of indigestion and various kinds of inflammation in the intestinal tract.

As already indicated, tuberculosis can be told by an examination of the sputum, and the bacillus of tuberculosis can also be identified if it invades other organs of the body, notably the skin, bladder, kidneys, etc. The presence of tuberculosis in milk can also be demonstrated by the microscope. The influenza bacillus, the bacillus of diphtheria, the organism of cholera, of dysentery, of malignant pustule, of blood-poisoning, of pneumonia, of actinomycosis, etc., can all be identified by a microscopical examination, as also can a number of diseases due to animal parasites in the body, other than intestinal worms. Thus there is no excuse for the general diagnosis of malaria unless the exact confirmatory evidence of the malarial parasite is found in the blood. The presence of *Trichina* in the body can also be learned by the peculiar changes that take place in the blood, and the blood-parasite *Filaria* (see FILARIASIS), which causes a variety of conditions in the tropics, is recognizable under the microscope. Further, the microscopical examination of the blood itself

offers a large field for clinical microscopy; a field which is very rapidly widening and offering increasing evidence of the value of this class of examination. There are many blood-diseases, *per se*, which can be diagnosed by simple examination. Anæmia and pernicious anæmia are important examples. Moreover, most of the acute infectious diseases cause certain changes in the blood which may be utilized in microscopical work for diagnostic purposes. The Widal agglutination reaction (q.v.) in typhoid fever is an important development in this line. Other agglutinating reactions are of immense importance in medico-legal work. These blood-changes are of a very definite character, and have been studied by physicians the world over. Because of their peculiar technical nature they lend themselves to charlatan misinterpretation and serve as a basis for many quackish advertisers.

Microscopical examination of the urine has long been practised. By its various forms of disorder of the bladder and of the kidney can be told, and both renal disease and bladder-disease can be detected long before such troubles become chronic and dangerous. In much the same manner the microscope can be used to examine other secretions and excretions of the human body—the secretions from the nose, the vomit, the exudates in pleurisy, exudates in meningitis and peritonitis, etc.—and in the study of drinking-water, milk, and foodstuffs. In fact there is no branch of medicine in which definite and far-reaching results have not been obtained by means of the microscope. Consult: von Jaksch, 'Clinical Diagnosis'; Simon, 'Clinical Diagnosis'; Ewing, 'Pathology of the Blood'; and Cabot, 'The Blood.'

Microtasmeter, an instrument invented by Thomas A. Edison in 1878. He uses the principle of the carbon microphone to measure infinitesimal pressure, or for detecting very slight pressure.

Microtome, an instrument for cutting thin sections of portions of plants and animals preliminary to their microscopic examination. The objects to be cut are imbedded in some material such as paraffin or celloidin, or frozen in gum, which makes the slicing of minute or delicate objects readily feasible. The cutting used to be done by holding the prepared object in one hand and wielding a razor in the other, but this method, apt to yield sections of unequal or insufficient thinness, has given place to the use of some device by which a sliding razor slices a fixed but adjustable object, or by which the object is made to move up and down across the edge of a razor. Many forms are on the market.

Midas, *mī'das*, in Greek myth, a king of Phrygia, proverbial for his golden touch and for his ass's ears. The gift of the golden touch came from Bacchus, whose follower, Silenus, Midas rescued and treated kindly; in return Bacchus offered him any wish he would name and Midas asked that all that he touched should be turned into gold. When he found that food and drink became gold at the touch of his lips, Midas besought Bacchus to take back the gift: some stories say he was sent to bathe in the river Pactolus, which ever after was full of gold-bearing sand. His ass's ears

MIDAS MONKEY — MIDDLEBURG

were given Midas by Apollo to punish the king for declaring Pan's pipe more musical than Apollo's lyre. Hence "ears of Midas" is a phrase used of ignorant critics. Midas' barber discovered the king's secret deformity; and whispered it into a hole in the ground, when grew up reeds whispering the story in the wind.

Midas Monkey, a marmoset (q.v.).

Middelburg, mid'dël-boorg, Netherlands, capital of the province of Zeeland, on the island of Walcheren, $4\frac{1}{2}$ miles northeast of Flushing. Middelburg was a mediæval Hanse town, and one of the leading mercantile cities of the United Provinces, sending many ships to the East and West Indies, and the Levant. Its former commercial importance, however, has declined, being now confined chiefly to a coasting and domestic trade. Pop. (1898) 18,635.

Middle Ages, *The*, a period of history supposed to extend from the fall of the Roman Empire to about the year 1550, covering from 10 to 11 centuries. The Middle Ages embrace that period of history in which the feudal system was established and developed, down to the most prominent events which necessarily led to its overthrow, though its consequences and influences are still very observable in the states of Europe. The first centuries of the Middle Ages are often termed the Dark Ages (q.v.), a name which they certainly deserve. Still, the destruction of Roman institutions by the irruption of barbarous tribes is often unduly lamented, and the beneficial consequences attending it overlooked. True it is that many of the acquisitions which had cost mankind ages of toil and labor were lost in the general wreck, and only regained by the efforts of many successive generations: the flowers of civilization were trampled under foot by barbarous warriors; the civil development of society suffered a most severe shock; those nations to which Roman civilization had extended previous to the great invasion of the Teutonic tribes were thrown back in a great measure to their primeval barbarism, and the unruly passion for individual independence greatly retarded the development of public and private law, and in some countries has entirely prevented a regular civil constitution. So also the most remarkable institution of that time, its characteristic production—chivalry—exhibited all the peculiarities of the corporations. War was the profession of the nobles. No one of their order who was not a knight could bear a lance or command cavalry. The weak side of the Middle Ages is the scientific. Physical science was still in a very crude state, and the lack of the proper apparatus necessary for its accurate pursuit was a serious handicap. Considering, however, the inefficient means then at hand, the knowledge attained, though of course rude, inaccurate and often mere guessing, was greater than is popularly supposed. The efforts of Charlemagne in the 8th century to encourage science and instruct the people laid the foundations for a more thorough and systematic training, which culminated in the great schools of Scholasticism of the 12th and 13th centuries. The process was slow and often retarded by the unsettled social and political conditions that prevailed through this period. The 14th and 15th centuries witnessed a rapid and brilliant development finding its apogee in the renaissance movement. See HISTORY.

Middle English. See ENGLISH LITERATURE.

Middle Kingdom, *The* (Chinese, Tchang-koee), a name applied to the Chinese empire by the natives, who imagine that it is located in the middle of the earth.

Middleboro, mid'l-bür-ō, Mass., town in Plymouth County; on the Nemasket River, and on branches of the New York, N. H. & H. railroad; about 30 miles south of Boston and 18 miles northeast of Fall River. It is one of the oldest towns in the county, having been incorporated 1 June 1669. It includes the villages of Nemasket, North Middleboro, South Middleboro, Four Corners, Puddingshire, Waterville, Tack Factory, Eddyville, Rock, the Green, and Thomastown. It has excellent water-power, obtained from three falls. The chief manufactures are woolen goods, shoes, stove polish, lumber, dressed marble, grates, foundry and machine-shop products. It has several well-built churches, good schools, and a public library. It is a favorite summer resort, on account of its attractive scenery and the temperature being modified by the sea breezes. Pop. (1890) 6,065; (1900) 6,885. Consult Barber, 'Historical Collections of Massachusetts.'

Middleburg, mid'l-berg, **Aldie and Upper-ville, Cavalry Engagements at**. On 16 June 1863 Gen. Stuart, with three brigades of his cavalry division, moved north from the Rappahannock to screen the movement of the Confederate army toward the Potomac. Stuart's orders were to keep along the eastern base of the Blue Ridge, occupy the passes of Bull Run Mountain, and cover the front of Longstreet's corps. On the 17th Fitzhugh Lee's brigade, under Col. Munford, was sent from Piedmont, by way of Middleburg, to Aldie, to hold the gap in the mountain as a screen to Longstreet's movements, while W. H. F. Lee's brigade reconnoitred toward Thoroughfare Gap. Robertson's brigade was posted at Rectortown. Stuart, with his staff and a few pickets, made his headquarters at Middleburg. Gen. Pleasanton was near Manassas Junction and scouting in the direction of Bull Run Mountain, and at 2:30 P.M. of the 17th Kilpatrick's brigade of cavalry ran into Munford's pickets, driving them back to Aldie, where, west of the village, he found Munford strongly posted on a hill covering the road to Snicker's Gap. A severe engagement ensued, lasting until dark, when Munford withdrew toward Middleburg, under orders from Stuart, who had been attacked. The Union loss was 50 killed, 131 wounded, and 124 missing. Munford's loss was 119 killed, wounded, and missing. While Kilpatrick was engaged at Aldie Col. Duffié, with the First Rhode Island cavalry 300 strong, having passed through Hopewell Gap, reached Middleburg about 4 P.M., drove in Stuart's pickets, and occupied the town, Stuart narrowly escaping to Rector's Cross Roads, and sending orders for Munford to withdraw from Aldie, the other two brigades to move upon Middleburg, and all to concentrate against Duffié. Robertson's brigade arrived at 7 P.M. and attacked Duffié, who made a good fight behind stone walls and barricades, repelling several assaults, but was finally driven from town, with severe loss, and compelled to retreat by the road upon which he had come until he had crossed Little River, where he halted, and where during the night he was entirely surrounded by

MIDDLEBURY — MIDDLESBROUGH

W. H. F. Lee's brigade. Duffié endeavored to cut his way out, but was met by heavy fire, and a great part of his command captured, Duffié escaping with a few men and making his way back to Hopewell Gap and Centreville. His total loss, killed, wounded, and prisoners, was over 200. On the 18th Stuart took position outside of Middleburg with Robertson's brigade. Munford was on the left at Union and Jones' brigade was ordered up as a reserve. Pleasanton moved forward with all his available force, and occupied Middleburg and Philemont on the road to Snicker's Gap. On the 19th Gregg, with two brigades of his own division and one of Buford's, advanced and steadily drove Stuart in the direction of Upperville, losing 99 in killed, wounded, and missing. During the day Hooker advanced and occupied Aldie Gap with infantry. On the 20th Stuart concentrated his five brigades about three miles west of Middleburg, Pleasanton remaining at Middleburg. On the morning of the 21st Pleasanton moved out of Middleburg, Buford's division by the road through Union, to turn Stuart's left, Gregg's division, supported by Vincent's infantry brigade on the main road to Upperville. Buford encountered W. H. F. Lee's and Jones' brigades and drove them back, and Gregg met Hampton's and Robertson's brigades, driving them steadily to Goose Creek, where they remained several hours, when they again fell back to effect a junction at Upperville with Jones and W. H. F. Lee, who were falling back before Buford. As Pleasanton neared Upperville the fight increased in severity, and Stuart was driven through the town to Ashby's Gap. The Union loss during the day was 12 killed, 130 wounded, and 67 missing. On the 22d Pleasanton fell back to Middleburg and Aldie. The Union loss June 17-21 was 883 killed, wounded, and missing; the Confederate loss was 65 killed, 279 wounded, and 166 missing, an aggregate of 510. Consult: 'Official Records,' Vol. XXVII.; Doubleday, 'Chancellorsville and Gettysburg'; McClellan, 'Life of Maj.-Gen. J. E. B. Stuart.'

E. A. CARMAN.

Middlebury, mīd'l-bēr-ī, Vt., village, county-seat of Addison County; on the Otter Creek, and on the Rutland railroad; about 40 miles in direct line southwest of Montpelier, the capital of the State, and 35 miles south of Burlington. It is on the eastern slope of the Green Mountains, near the foot-hills. It is in an agricultural and stock-raising region, with large marble quarries in the vicinity. It was settled in 1773, but was abandoned during the Revolutionary War, because it was on the route traversed by many of the British and Indian soldiers, and the lives of the people were constantly in danger. It was incorporated as a borough in 1813 and as a village in 1832. The chief manufactures are lumber and lumber products, foundry products, flour, lime, dressed marble, and dairy products. The village is the seat of Middlebury College (q.v.), and has two libraries, and the Sheldon Art Museum. Some of the principal buildings, besides the college, libraries, and museum, are the opera house, courthouse, several churches, and the public and parish schools. The water-power is most valuable, and sufficient for more manufacturing establishments. The government is vested in a board of trustees elected annually; the subordinate offi-

cials are chosen by the trustees. Pop. (1890) 1,762; (1900) 1,897. Consult Swift, 'History of the town of Middlebury.'

Middlebury College, in Middlebury, Vt., has a charter which bears the date 1 Nov. 1800. The first meeting of the corporation was held 4 Nov. 1800, when Jeremiah Atwater was made president, and Joel Doolittle, tutor, both graduates of Yale. The college opened 5 Nov. 1800, with seven students. The building used was a part of a large wooden structure erected for the Addison County Grammar School. For a number of years the school was sustained mainly by the generous contributions of the people of Middlebury. In 1810 Col. Seth Storrs, one of the trustees, gave to the college 30 acres of land which is now a part of the campus. In 1815 Painter Hall was built on this land, a building named after Gamaliel Painter, a generous benefactor. The same year the State legislature passed a vote complimenting the new college on its success, but gave no pecuniary assistance. Later bequests came; 5,000 acres of wild land and \$14,000. To these gifts donations were added, but the college had a struggle for existence and the brunt was bravely borne by the loyal faculty and the generous people of Middlebury. The Civil War took away a number of the best and bravest, as it depleted the colleges all over the country. Statistics show that up to and including 1902, there have been 1,567 graduates. Of this number 538 became clergymen; 100 professors in colleges and seminaries; 366 lawyers, including 50 judges; and 93 physicians. Nine of the graduates have been governors of States and Territories. From 1883 to 1902 the college has been coeducational; in 1902 the legislature of the State granted a charter authorizing the establishment of a separate college for women.

The courses lead to the degrees of B.A. and B.S. Various prizes and the incomes of 120 scholarships are available for assisting worthy students. The library contains nearly 30,000 volumes; the new marble library building is a gift from Egbert Starr and Dr. M. Allen Starr. Other buildings, all of stone, are the Warner Science Hall, the chapel, the Painter Hall, Battel Hall (women's building), and the dormitories for young men. In 1902 there were connected with the school 11 professors and instructors and 118 students. The productive fund was \$400,000 and the income nearly \$25,000.

Mid'dlemarch, a novel by George Eliot, published in 1872. This the author is said to have regarded as her greatest work. It takes its name from a provincial town in or near which its leading characters live. The book is really made up of two stories, one centring around the Vincy family, and the other around Dorothea Brooke and her relatives. In the characters of Dorothea and Lydgate George Eliot develops the main purpose of this novel, which is less distinctly ethical than some of her others.

Middlesbrough, mīd'lz-brō (not Middlesborough), England, a river port, municipal county, and market town, in the North Riding of Yorkshire, near the mouth of the Tees, 44 miles north of York. Middlesbrough dates from about 1830, and the development of the coal and iron mines of the neighboring Cleveland Hills and Durham fields. It is distinguished for its municipal enterprise; has wide and regular

MIDDLESEX FELS—MIDDLETON

streets, handsome public buildings; and extensive and commodious docks. Its chief industries are connected with iron manufactures, producing annually over 2,000,000 tons of pig-iron; in 1901 it exported 960,785 tons of pig-iron, and 353,649 tons of manufactured iron and steel. It has numerous blast-furnaces and rolling-mills, foundries, engineering works, ship-yards, etc.; and salt is extensively worked, there being a thick bed of rock salt at a depth of 1,300 feet. The borough was incorporated in 1853 and received a county charter in 1888. Pop. (1901) 91,317.

Middlesex (mîd'1-sĕks) **Fells**, Boston, Mass., a picturesque hill, wood, and lake reservation of the metropolitan park system of "Greater Boston," enclosing Mystic Lakes; area from 3,000 to 3,200 acres. The Fells are part of the suburban townships of Malden, Melrose, and Stoneham north of Boston.

Middleton, mîd'1-tŏn, **Arthur**, American colonist: b. South Carolina 1681; d. 1737. He was conspicuously engaged in public affairs as a member of the council as early as 1712; and exerted his political influence in favor of popular claims, opposing the lords proprietors, and finally heading the revolution which threw off the whole proprietary government and placed the colony under the immediate protection of the crown (1719). In 1725 he succeeded Nicholson as acting governor of the colony, which office he held till 1731, when the royal governor arrived; he then retained his position in the governor's council. His administration as governor was partly occupied by war and negotiations with the Spaniards of Florida and the French of Louisiana.

Middleton, Arthur, American patriot, signer of the Declaration of Independence, grandson of the preceding: b. Middleton Place, Ashley River, S. C., 26 June 1742; d. Goose Creek, S. C., 1 Jan. 1787. He was educated in England at the University of Cambridge, then returned to South Carolina for a time, and was a member of the legislature, but went abroad again for two years' travel on the Continent. On his final return to America, he established himself as a planter, and soon became one of the leaders of the Revolutionary party. He was one of the most efficient members of the first council of safety, and in 1775 was sent to the Provincial Congress. In 1776 he was sent as a delegate of the State to the Continental Congress, and as such affixed his signature to the Declaration of Independence. He held his seat in Congress until 1777, declined the governorship of South Carolina in 1778, and took the field for the defense of Charleston in 1779. His plantation was devastated by the British and he was made a prisoner after the fall of Charleston in 1780, and was one of the leading citizens who were kept in confinement as hostages. His estate was sequestered, and he was shipped to the castle of Saint Augustine, and thence transferred to the Jersey prison ship. Exchanged in the latter part of 1780, he served till the close of the war as a delegate in the Continental Congress, and was afterward elected to the State senate. He was a skillful stenographer, and reported many of the debates in which he participated. He also wrote effective political essays under the signature of "Andrew Marvell."

Middleton, Conyers, English clergyman: b. York (or Richmond) 27 Dec. 1683; d. Hilder-

sham, Cambridgeshire, 28 July 1750. He was graduated from Trinity College, Cambridge, in 1703; became fellow of the college in 1706; was one of the 30 fellows who petitioned against Bentley, then master of Trinity, in 1710; was involved in a dispute with Bentley as to a fee paid by him to Bentley upon his receiving the D.D. (1717); and was sued for libel by Bentley for statements made in his 'Present State of Trinity College' (1719). The feud was adjusted by a compromise. In 1731-4 he was Woodwardian professor of mineralogy. For his part in a controversy with Waterland regarding the historical accuracy of the Bible, he was threatened with the loss of his degrees. His best-known work is the eulogistic 'Life of Cicero' (1741), once highly esteemed for its style, but in part plagiarized from Bellenden's 'De Tribus Luminibus Romanorum.' His treatises on "the Miraculous Powers which are supposed to have subsisted in the Christian Church from the earliest ages" (1748-9) aroused much comment.

Middleton, Sir Frederick Dobson, British soldier: b. Belfast, Ireland, 4 Nov. 1825; d. England 1898. He was graduated from the Royal Military College at Sandhurst in 1842, and entering the army served in many campaigns in the colonies and received the Victoria cross for gallant conduct in India. In 1884 he was placed in command of the Canadian militia and crushed the Riel rebellion, in recognition of which service he was knighted. He returned to England in 1890.

Middleton, Henry, American politician and diplomat: b. Middleton Place, S. C., 1771; d. Charleston, S. C., 14 June 1846. He was elected to the State legislature in 1801, serving till 1810. He was soon recognized as a leader, and in 1810-12 was governor of the State. He supported the war policy in 1812, and in 1815 he was elected to Congress, where he served four years. In 1820 he was appointed minister to Russia, in which capacity he negotiated a treaty regulating trade and fisheries in the Pacific (1824). He returned to the United States in 1830, and retired from public life.

Middleton, Thomas, English dramatist: b. probably in London about 1570; d. Newington Butts July 1627. Little is known of his life, but his writings testify to the excellence of his education before his entry at Gray's Inn in 1593 (or 1596). Several minor prose works preceded what seems to be his first play, 'Old Law,' written with Rowley in 1599. From that time on he wrote constantly for the stage, now alone, now with Rowley, Massinger, or Dekker. Among these works are several masques, of which the best and most dramatic is 'The World Lost at Tennis.' Middleton's 'Witch' is his best known work because of the claim, often made since its publication in 1778, that it must have furnished hints for the song of the witches in Shakespeare's 'Macbeth'; but Middleton's verse, which is particularly reminiscent of 'Romeo and Juliet,' and his imitation of Shakespeare, as, for example, of 'Hamlet' and 'Tempest,' possibly of 'Pericles,' too, in 'The Mayor of Quinborough,' make such a view untenable. It is more likely that the songs were taken from Middleton's play and inserted into the acting edition of 'Macbeth.' The most successful play by Middleton was 'A

MIDDLETON — MIDDLETOWN

Game of Chess,' which satirized the wooing of the Spanish Infanta and was stopped by privy council; it packed the playhouses because of its political and Protestant tone. Among his other plays are 'Michaelmas Term' (1607), 'a story of city intrigue; 'A Trick to Catch the Old One' (1608), his best comedy of intrigue; 'The Roaring Girl'; 'The Spanish Gipsy,' which, like the 'Mayor of Quinborough' and 'A Mad World,' has the Hamlet-like trick of a play within a play; and 'Women Beware Women,' his best single play. As a rule Middleton is erratic and ill-sustained, and his characters low and coarse, but sometimes wonderfully analyzed. Consult the editions by Dyce (1840) and Bullen (1886), and Swinburne's essay in the 'Nineteenth Century' for January 1866. Middleton's best plays appear in a volume of the 'Mermaid Series' (1887).

Middleton, Thomas Fanshawe, English prelate and classical scholar: b. Kedleston, Derbyshire, 26 Jan. 1769; d. Calcutta 8 July 1822. He was educated at Christ's Hospital, London, and Pembroke Hall, Cambridge; took orders in the Anglican Church, and in 1814 was consecrated first bishop of Calcutta. He wrote 'The Doctrine of the Greek Article applied to the Criticism and Illustrations of the New Testament' (1808, 5th ed. 1858). Consult 'Life' by Le Bas (1831).

Middleton, Canada, a town of Annapolis County, Nova Scotia, 102 miles northwest of Halifax. Its industries are connected with the valuable iron and copper mines in the neighborhood, and it has railroad interests as a station on the Windsor & Annapolis railroad, and as the northwest terminus of the Nova Scotia Central railroad. Pop. (1901) 2,000.

Middleton, England, a market town, municipal and parliamentary borough, in Lancashire, 5 miles northeast of Manchester. Its industrial establishments include cotton and silk factories, dye and print works, ironworks, chemical works, etc., and coal is mined in the vicinity. The grammar school was founded in 1572, and there are four free libraries and reading rooms, parks, recreation grounds, and a handsome market-place. Pop. (1901) 25,178.

Middletown, mid'l-town, Conn., city, county-seat of Middlesex County; on the Connecticut River, and on the New York, New Haven & Hartford railroad; about 18 miles south of Hartford. It is opposite Portland, where are valuable brownstone quarries. The places are connected by a long drawbridge.

The city was founded in 1650 and the next year was incorporated as a town under the name of Mattabesek. Two years later the name was changed to Middletown. It was granted a city charter in 1784. For a number of years there was considerable trade with the West Indies, and until 1886 Middletown was the port of entry. In that year the custom-house business was removed to Hartford.

Middletown is in an agricultural region in which tobacco is one of the principal products. The good water-power here has aided in making the place a manufacturing city. The chief manufactures are pumps, bone goods, cotton webbing, hammocks, rubber goods, silks, harness trimmings, locks, marine hardware, and silver-plated ware. The educational institutions are

the public and parish schools, the Wesleyan University (q.v.), the Berkeley Divinity School (P. E.), opened in 1854, and the Russell Free Library which contains about 15,000 volumes. It has the State Hospital for the Insane, and the State Industrial School for girls.

The charter of 1882, under which the government is administered provides for a mayor, who holds office two years, and a city council. The subordinate officials are chosen by the mayor and council. Pop. (1890) 9,013; (1900) 9,859. Consult: Whittemore, 'History of Middlesex County, Conn.'

Middletown, Del., town, in Newcastle County; on the Philadelphia, Wilmington & Baltimore railroad; about 22 miles south by west of Wilmington, the capital of the State. It is in an agricultural region in which the chief productions are fruits. The principal manufactures are canned-fruits, wagons, and agricultural implements. Pop. (1890) 1,454; (1900) 1,567.

Middletown, N. Y., city, in Orange County; on the New York, Ontario & W., the New York, Susquehanna & W., and the Erie R.R.'s; nearly midway between the Hudson and Delaware rivers, and about 66 miles northwest of the city of New York. Middletown was settled about the middle of the 18th century; its location on the Minisink road, the route to the "West," and half-way between the important rivers of this section, gave the place its name, and its early importance. At first it was included in the Walkill township. In 1848 it was incorporated as a village, and 27 June 1889 was chartered as a city. It is in a fertile agricultural region, and has a large trade in dairy products, live-stock, and garden produce. It has the New York, Ontario & Western railroad shops, and the chief manufactures are hats, shirts, saws, printers' supplies, files, carpet-bags, leather, condensed-milk, paper boxes, and cigars. Some of the noted public institutions are the State Homeopathic Hospital for insane, with 1,300 patients (1903), the churches, and the schools. There are seven churches, seven public schools (ward schools), one parish school, an excellent high school, Saint Joseph's Academy (R. C.), and the Thrall Public Library. There are two national and one savings bank, which with one trust company bank have a combined capital of \$400,000.

The government is administered under a charter of 1902 which provides for a mayor, who holds office two years, and a common council of nine members, each one of whom holds office two years. The mayor appoints, subject to the approval of the council, the members of the board of health, and the council elects the engineer, city clerk, and corporation counsel. There are but few foreign born inhabitants, chiefly Italians. About 100 are colored persons. Pop. (1890) 11,977; (1900) 14,522.

JOHN W. SLAUSON,
Editor of 'Press.'

Middletown, Ohio, city, Butler County; on the Miami River, the Miami and Erie Canal, and on the Cincinnati, H. & D., the Cincinnati Northern, and the Cleveland, C., C. & St. L. R.R.'s; about 34 miles north of Cincinnati. It was settled about 1794. It is in an agricultural section, but the good water-power has con-

MIDDLETOWN — MIDSUMMER NIGHT'S DREAM

tributed toward making it a manufacturing city. Its principal manufactures are bicycles, agricultural instruments, tobacco products, paper, flour, and dairy products. It has an opera house, a Masonic Temple, public and parish schools, and several fine churches. The city owns and operates the waterworks. Pop. (1890) 7,681; (1900) 9,215.

Middletown, Pa., borough, in Dauphin County; on the Susquehanna River, and on the Philadelphia & Reading and the Pennsylvania R.R.'s; about 10 miles southeast of Harrisburg. It was founded in 1756, and in 1828 was incorporated. It is in a farming region, but it has considerable manufacturing interests. The principal manufactures are flour, dressed lumber, leather, foundry products, tubing, stoves, furniture, and cars. Stone quarries in the vicinity contribute to the industrial wealth of the borough. Its trade is in the manufactured articles, farm and dairy products. The borough owns and operates the electric light plant. Pop. (1890) 5,080; (1900) 5,608.

Midgard, mid'gård, in Scandinavian mythology, the dwelling place of the human race, formed out of the eyebrows of Ymir, one of the first giants, and joined to Asgard, the abode of the gods, by the rainbow-bridge.

Midge. See BLACK-FLY; GNAT.

Midhat Pasha, mid'hât pâsh'â, Turkish statesman: b. Constantinople 1822; d. Arabia May 1884. He entered the Turkish government service, was made pasha in 1820, was governor successively of Uskup, Bulgaria, and Salonica, and distinguished himself by his wise administration. In 1873 he was for a short time grand-vizier. He aided in deposing the Sultans Abd-ul Aziz and Murad V. in 1876, was grand-vizier under Abd-ul Hamid (Dec. 1876-Feb. 1877), and was then banished by the suspicious monarch. Later, however, he was governor of Smyrna, then of Syria. He was tried with other pashas for the murder of Abd-ul Aziz, was found guilty, and was sentenced to death; but this sentence was commuted to life imprisonment. He wrote 'La Turquie: Son Passé et son Avenir' (1878).

Midianites, mid'i-an-itz, an Arab tribe, descended, according to Scripture, from Midian, the son of Abraham by Keturah. They occupied most of the country between the Arabian Gulf and the Plains of Moab. The Midianites were very troublesome neighbors to the Israelites till Gideon's victory over them. Midian ceased to be Egyptian and became Turkish in 1887. Consult 'Midian Revisited' (1879).

Midland, Mich., city, county-seat of Midland County; on the Chippewa and Tittabawassee rivers, and on the Michigan Central and the Pere Marquette R.R.'s; about 20 miles west of Bay City. It is in what was once a lumbering region, and its industries are still connected with the products of the forests although in the near vicinity the woods have about all been turned into lumber. Its principal manufactures are shingles, lumber, tubs, hoops, pails, bromine, and salt. Pop. (1890) 2,277; (1900) 2,363.

Midnapur, mid-na-poor', India, a town and administrative district of Bengal. The town is the capital of the district and is 68 miles by rail west of Calcutta. It is the centre of an important indigo and silk industry, and has

manufactures of brass and copper goods. Pop. (1901) 33,140. The district forms the southern part of the Bardwan division, bounded on the east by the river Hugli. It has an area of 5,186 square miles. Pop. (1901) 2,792,953.

Midnight Judges, or **Appointments**, a term applied to executive appointments or nominations made by President John Adams, the last night of his administration. Congress had passed a bill authorizing the appointment of 18 new United States judges, and Adams with the consent of the Senate appointed judges to fill these newly created vacancies. They were known as "Adams' Midnight Judges." The new law was repealed early in Jefferson's term and the judges lost their offices.

Mid'raah (Hebrew, from *darash*, to make research), among the Jews, is the general name given to the exposition or exegesis of the Scriptures. When such writings first arose is not known, but the most flourishing period of mid-rashic exegesis was from about 100 B.C. to 200 A.D. The term midrash expressed 'any and every ancient exposition on the law, psalms, and prophets, disquisitions that took the form of allegorical illustration, homiletics, or practical commentary.' Thus in its most general meaning it expressed the whole uncanonical Jewish literature, including the Talmud, down to the compilation of the book *Jalkuth* in the 13th century, since which time the term gradually ceased to be applied to rabbinical writings. See HEBREW LITERATURE; TALMUD.

Mid'riff (A.-S. *mid*, middle; *hrif*, abdomen), the diaphragm (q.v.).

Midshipman, in the American and British navy, a young officer who has previously held the position of a naval cadet. The cadets require to be nominated before they can come forward for competition. After two years' training on board a training-ship, the cadet is expected to pass the examinations appointed. If he gain a first-class certificate he becomes a midshipman at once, otherwise he has to serve for six to twelve months at sea. A midshipman after four years and a half may become a sub-lieutenant; he then studies at the Naval College, is trained in gunnery and torpedo practice, takes a course in pilotage, and then may become a lieutenant.

Midshipman, a Californian coast-fish of the genus *Porichthys*. See CABEZON.

Midshipman Easy, Mr., a nautical romance by Captain Frederick Marryat, published in 1836. It narrates the adventures of a spoiled lad, the son of a so-called philosopher, who cruises about the world, falls in love, has misfortunes and at last good luck and a happy life. The incidents themselves are nothing, but the book is entertaining for its "character" talk, and because the author has the gift of spinning a yarn.

Midsommer Eve. See SAINT JOHN'S, EVE OF.

Midsommer Night's Dream, A, a comedy by Shakespeare, written about 1598. It is spoken of by Meres in his 'Palladis Tarnia' (1598) and was entered on the Stationers' Register 8 Oct. 1600. The theme of this joyous comedy is love and marriage. Duke Theseus is about to wed the fair Hippolyta. Lysander is in love with Hermia, and so is Demetrius; though in

MIDWAY ISLANDS—MIFFLIN

the end, Demetrius, by the aid of Oberon, is led back to his first love Helena. The scene lies chiefly in the enchanted wood near the duke's palace in Athens. In this wood Lysander and Hermia, and Demetrius and Helena, wander all night and meet with strange adventures at the hands of Puck and the tiny fairies of Queen Titania's train. An overture 'Midsummer Night's Dream' was composed by Mendelssohn in 1826, and his music for the drama was written in 1843.

Mid'way Islands, North Pacific Ocean, so named from being midway between Asia and America, are the northernmost islets of the Hawaiian group, extending about 1,800 miles north by west of Honolulu. The islands have come into prominence as the intermediate station of the American-Pacific cable to the Ladrone and Philippine Islands via Honolulu. The group consists of a low coral atoll 18 miles in circumference, enclosing Sand Island, Eastern Island, and two islets. Sand Island, the largest, is 1¾ miles long, ¾ of a mile wide, and has an average elevation of from three to ten feet above sea-level, the highest point attaining 43 feet. Eastern Island is 1¾ miles long, one half mile wide, and from six to twelve feet high. Both islands are partly covered with coarse grass and bushes, the breeding ground of the tern or seagull. Good water is obtained by sinking wells, while fish of many varieties, turtles, crabs and crawfish, etc., abound in the lagoon; seabirds also are easily caught. The islands are inhabited only by the employees at the cable stations. From 1887-9 a shipwrecked crew lived here for 14 months until rescued, losing, however, several of their number from scurvy. A short distance west of the islands a submarine mountain rises 2,200 feet from the ocean bed to within 82 fathoms of the surface, and between the islands and Guam is an abyss of over 4,900 fathoms, one of the deepest in the world.

Mielziner, mēl'zīn-ēr, **Moses**, American rabbi and educator: b. Schubin, Germany, 12 Aug. 1828; d. Cincinnati, Ohio, 18 Feb. 1903. After studying at the University of Berlin, he became rabbi of a congregation in Waren, Germany, and then head of a theological school in Copenhagen. In 1865 he was called to the rabbinate of a New York synagogue, which he held until 1873, when for six years he was principal of a private school besides co-operating in the Emanu El Preparatory School. In 1879 his real educational work was begun in the United States when he was appointed professor of the Talmud at the Hebrew College, which position he held until his death. As teacher he was clear, exact and thorough. His published works include: 'The Jewish Law of Marriage and Divorce' (1884); 'Selections from the Book of Psalms' (1884); 'Slavery among the Ancient Hebrews' (1894); 'Introduction to the Talmud' (1884 and 1903); 'Legal Maxims and Fundamental Laws of the Civil and Criminal Code of the Talmud' (1898); 'Rabbinical Law of Hereditary Success' (1900).

Mieris, mē'ris, **Frans van**, 'the Elder,' Dutch painter: b. Leyden 12 April 1635; d. there 12 March 1681. He was originally a pupil of

the glass painters A. Torenvliet and G. Dous and eventually became so famous as a canvas artist that the grand-duke of Tuscany, and other noblemen ordered pictures from him; his work was remarkable both for refinement of handling and elegance of design. His portraits and genre pictures, in which both nobility and bourgeoisie are represented, are not conspicuous for striking and original characterization. Only two or three figures appear in most of his genres, and his compositions of this kind are delicate and smooth to a degree that renders them almost inanimate. There are portraits of himself and his wife in the gallery of The Hague, and in the Pinakothek at Munich, which latter collection is especially rich in examples of this master, among them 'An Oyster Breakfast'; 'Lady Playing a Lute'; 'The Trumpeter'; 'The Sick Woman.' Many of his pictures are to be met with in the galleries of Paris and Dresden such as 'The Artist'; 'A Lady Painting'; 'Love's Message'; 'The Music Lesson'; and in the Berlin Gallery is his 'Young Lady before a Looking-glass.'

Mieris, **Frans van**, 'the Younger,' grandson of the preceding, Dutch painter: b. Leyden 24 Dec. 1689; d. there 22 Oct. 1763. He painted genre and portraits after the manner of his father, who had produced a number of small club pictures, and of his grandfather. He did more service perhaps by his literary work than by his pictures, which have the ancestral fault of superficiality. He wrote 'Histoire der Nederlandsche Vorsten' (1732-5); 'Groot Charterboek der Graven van Holland, van Zeeland en Herren van Vriesland' (1753-6); and 'Handvesten der Stad Leyden' (1759).

Microslawski, mē-ā-rō-slāw'skē, **Louis**, Polish general: b. Nemours, France, 1814; d. Paris 13 Nov. 1878. He joined the Polish revolution of 1830; fought with conspicuous zeal; upon the suppression of the movement returned to France; in 1840 was a member of the central committee of the Polish emigration party; and later was identified with the unsuccessful conspiracies of 1846, 1848-9, and 1863. He wrote a 'History of the Polish Revolution' (1837) in French, and political and historical works in Polish.

Mifflin, mif'lin, **Lloyd**, American poet: b. Columbia, Pa., 15 Sept. 1846. He was educated at Washington Classical Institute and abroad and devoted himself to painting, a collection of which he has exhibited. His health failed and he devoted himself to literature and is the author of: 'The Hills' (1896); 'At the Gates of Song' (1897); 'The Slopes of Helicon and Other Poems' (1898); 'Echoes of Greek Idyls' (1899); 'The Fields of Dawn and Later Sonnets' (1900).

Mifflin, **Thomas**, American soldier and politician: b. Philadelphia 1744; d. Lancaster, Pa., 20 Jan. 1800. He was by birth a Quaker; was graduated at Philadelphia College in 1760; entered public life in 1772 as a member of the Pennsylvania Assembly; and in 1774 was elected a delegate to the Continental Congress. In 1775 he entered the army with the rank of major, and as colonel and first aide-de-camp to Washington accompanied him to Cambridge. He subsequently held the appointment of adjutant-general, and in the spring of 1776 was commissioned as brigadier-general. He fought in the battle of Long Island, and by his energy

MIFFLIN — MIGRAINE

succeeded in the latter part of 1776 in raising considerable reinforcements in Pennsylvania to recruit Washington's army. He was present at the battle of Trenton, and did good service in driving back the enemy's line of cantonments from the Delaware. In 1777 he was made a major-general, and in the same year became an active member of the faction organized for the purpose of placing Gates at the head of the Continental army, and known in history as the Conway Cabal (q.v.). The project failing, he resigned his commission, and in 1782 was elected to Congress, of which body he became president during the following year. In this capacity he received from Washington the resignation of his commission as commander-in-chief. In 1785 he became speaker of the Pennsylvania legislature, and in 1787 he was a delegate to the Constitutional convention. In October 1788, he succeeded Franklin as president of the Supreme Executive Council of Pennsylvania, which position he filled for two years; and from 1790 to 1799 he was governor of the State. In 1794, while holding this office, he rendered important assistance to Washington in quelling the Whiskey Insurrection (q.v.).

Mifflin, Warner, American reformer: b. Accomac County, Va., 21 Oct. 1745; d. near Camden, Del., 16 Oct. 1798. When a boy on his father's plantation he became convinced of the evil of slavery, and when he himself became a slave owner, he freed all his slaves and paid them for their past services. He was a Quaker, and traveled widely, preaching against slavery. It was largely through his efforts that the Quakers came to oppose slavery, and many followed his example in freeing their slaves. On account of his religious principles he opposed the Revolutionary War, and at the time of the battle of Germantown, interviewed both General Washington and General Howe to impress upon them the evils of the war. In 1782 he was instrumental in securing a law in Virginia which allowed for emancipation of slaves; in 1783 he presented a memorial to Congress in regard to slavery, and in 1791 another memorial on the same subject to the President and Congress, which was the cause of a sharp debate on the right of petition. Shortly afterward he published a series of essays defending his position in the matter.

Mifflin, Fort. See FORT MIFFLIN.

Mignard, Pierre, French painter and engraver: b. Troyes November 1612; d. Paris 20 May 1695. He studied in Bourges under Jean Boucher and in Paris under Simon Vouet. In 1636 he went to Italy and spent most of his time in Rome, whence he was surnamed "The Roman" (Le Romain). He imitated Annibale Caracci, and among other portraits, including those of many Roman nobles, painted likenesses of Popes Urban VIII. and Alexander VII. In 1654 he went to Venice where his success as a portrait painter continued. On being summoned to Paris by Louis XIV. he painted portraits of the young king and of Mazarin and afterward was commissioned to decorate the cupola of the church of Val de Grace with over 200 figures of prophets, martyrs, etc. This work, the largest piece of fresco painting in France, soon lost the beauty of its coloring, owing to the painter's want of familiarity with the art of working on a wet plaster ground. He subsequently pro-

duced some paintings for the palace of Versailles and was made director of the royal art collection and superintendent of the manufacture of the Gobelin tapestry. His pictures suffer from the faults of his day; they are stiff and conventional; but glow with the warm and harmonious coloring of the Venetian school. His portraits are the best of the early French school. A remarkable collection of his works is to be found in the Louvre, but the Berlin Museum possesses the finest of his portraits, that of Maria Mancini. Consult Lebrun Dalbaune, 'Etude sur Pierre Mignard' (1878).

Mignet, François Auguste Marie, frän-swä ö güst mã-rê mên-yâ, French historian: b. Aix, Provence, 8 May 1796; d. Paris 24 March 1884. He was educated at Avignon; studied law in Aix; went to Paris in 1822 after winning a prize from the Academy of Inscriptions by his essay on French institutions, government and legislation in the time of St. Louis; joined the staff of the *Courrier Français*; lectured on modern history at the Athénée; was elected to the Academy in 1836; and after the revolution of 1848 lost the place he had held for 18 years as archivist of the Foreign Office. His most important work was a 'History of the French Revolution' (1824). Besides this he wrote biographies of Franklin (1848), of Mary Stuart (1851), and of Charles V. (1854). Consult Trefort, 'Mignet und seine Werke' (1885).

Mignonette, mîn-yō-nê't', a genus (*Reseda*) of annual and perennial herbs of the order *Resedaceæ*. The species, of which there are about 50, are natives of western Asia and the Mediterranean region. They have simple or compound leaves, and terminal spikes of small, pale, usually greenish flowers. Less than half a dozen species are cultivated, the most important being the common mignonette (*R. odorata*), a universal favorite both in gardens and in greenhouses because of its fragrant flowers. It is a branching annual herb of decumbent habit when in its prime, and will thrive in any cool, moist, fairly rich soil, when partly shaded from the noon-day sun. For out-door blooming the seeds are sown successively from early spring to midsummer, and for winter blossoming from that time forward at intervals of three or four weeks.

Mignot, mên-yō', Louis Remy, American painter: b. Charleston, N. C., 1831; d. 1870. He began his studies in Holland in the studio of Schelfhout and returning to New York was elected a National Academician. He left the country during the Civil War and never returned. While he painted portraits, etc., his chief strength lay in the department of landscape. His most notable works are: 'Lagoon of Guayaquil, South America' (1863); 'Evening in the Tropics' (1865); 'Snow in Hyde Park'; 'Sunset off Hastings' (1870); and 'Chimborazo' (1871).

Migraine, or **Megrin** (also called hemi-crania and, popularly, sick-headache and nervous headache), an affection marked by a painful headache, neuralgic in character, usually periodical, more or less unilateral, involving one side of the head or of the brow and forehead; and frequently associated with nausea and bilious vomiting. The predisposing causes are chiefly hereditary tendency, anæmia, a general

MIGRATION

want of tone, and the nervous temperament. Among the exciting causes are prolonged mental work, mental anxiety or excitement, grief, bodily fatigue, over lactation, late hours, sexual excesses, and improper food. Treatment requires rest, sometimes in bed; the allaying of pain by anodynes and hot applications; and removal of constipation and other abnormal conditions. In the intervals between the attacks efforts should be directed toward raising the general tone, and especially the strength of the nervous system.

Migration. The migrations of organisms are of two kinds, secular and seasonal. While certain mammals change their feeding grounds to a limited extent, and fishes as well as a very few insects are known to migrate, the habit of seasonal migration is especially characteristic of those birds which breed in the cooler parts of the earth. In the United States and British America nearly all the birds which breed in the central and northern portions fly southward in the autumn, and winter in the Southern States or in Central America, Mexico, and the West Indies. Thus the robin which has reared its young in Maine or Canada, may be seen in March near the timber line on the flanks of Popocatepetl. Most of the birds which breed in northern and central Europe take flight at the approach of cold weather into northern Africa, including Algeria and Egypt. On the other hand the Arctic birds after rearing their broods in high latitudes, seek more temperate climes and more open seas in the winter, where food is more available.

Migration of Birds.—The more typical seasonal migrants are the geese, ducks, shore and wading birds, and the woodpeckers and singing birds. The larger number of tropical birds and many extra-tropical forms, do not migrate. It is probable that in the Tertiary period, or just before the incoming of the Glacial period, when the polar regions were at least semi-tropical in their climate, there were no seasonal migrations. It is a habit which has sprung up since the present climates have prevailed, and is due to the fact that the ground becomes frozen, or covered with snow, so that the food supply is cut off, and storms and blizzards rage, with temperature too low for the existence of the less hardy species.

The routes by which birds migrate to and from their breeding places are quite definite, and lie along the coast lines, mountain ranges, or in great river valleys like that of the Mississippi. In the eastern United States the migrants returning from their winter quarters and seeking their breeding grounds in the north pass along the eastern slope of the Mexican plateau, and cross over from the West Indies. Here the route of travel is divided by the Alleghany ranges into two, one pathway extending along the Atlantic coast, up through New England and the Hudson River Valley; the other passing up the Mississippi, Missouri, and Ohio valleys. Another line of migration follows along the valleys and peaks of the Rocky Mountain ranges; another to the westward up the valley of the Rio Grande; and, lastly, one goes along the Pacific coast. In Europe and central Asia there are numerous routes, at least nine, according to Palmen. Of these one begins on the Siberian shores of the Polar sea, Nova Zembla, and the north of Russia, and passes down the western coast of Norway to the

North Sea and the British Isles; another arising at Spitzbergen follows much the same course, but is prolonged past France and Spain to the west coast of Africa. Many migrants wintering in north Africa (Algeria, etc.) have flown there from northern Russia, by way of the Baltic Sea, Holland, passing up the Rhine Valley, and crossing to the Rhone, the column splitting on reaching the Mediterranean, one line of migration passing along western Italy and Sicily, a second crossing by way of Corsica and Sardinia, the third by southern France and eastern Spain. Egypt receives its winter visitors from the Russian river-valleys of the Obi and Volga, the line crossing the Black, Bosphorus, and Aegean seas to the Nile Valley. Indeed, both in Eurasia and North America the birds follow the easiest and most protected lines of travel, flying in the line of least resistance.

It is supposed that a proportion of the birds fly at high elevations, in some cases at a height of one or two miles, thus passing over beyond ordinary vision. This is on clear and bright nights. In cloudy and stormy weather the birds fly low, and at such times "rushes" occur when great numbers becoming lost and confused dash against the windows of lighthouses. The rate at which birds sometimes fly is very great, if we are to credit Gatke's estimate. He states that curlews, godwits, and plovers will fly at the rate of about four miles a minute, or nearly twice as rapidly as our swiftest electric carriages. The carrier pigeon, a migrant, is known to fly at an average speed of 36 miles an hour, while in two of them a rapidity of about 55 miles was maintained for four consecutive hours. Of the night- and high-flying migrants we see but little. They are the nocturnal species, such as owls, the goat-suckers, and a large portion of small shy birds.

Causes of Migratory Movements.—As has been stated the initial cause of the migration of birds breeding in the Arctic and boreal regions was the incoming of the Glacial period and of the present low temperature of the Polar regions where the earth is frozen and snow-clad. The food-supply being cut off in the winter time, they are obliged to fly to regions where worms, insects, and seeds can be had. It is temperature and food that regulate the distribution of animals in general, and also their migratory movements. Newton says that in the North Temperate (holarctic) region every bird is to a greater or less degree migratory in some part or other of its range. Birds are less affected by extremes of cold and heat and other climatic influences than any other vertebrates, "provided only their supply of food is not affected thereby." Competition also comes into play. Birds of prey customarily drive away their offspring from their own haunts as soon as they are able to get their own food, owing to the impossibility of both parents and progeny getting a livelihood in the same vicinity, and this applies to many other kinds. Newton thus accounts for the origin of waves of migration: As food grows scarce toward the end of summer in the most northern limits of the range of a species, the individuals affected thereby seek it elsewhere and thus press on the haunts of other individuals; these in like manner upon that of yet others, until the movement which began in the far north is communicated to the individuals

MIGRATION

occupying the extreme southern range of the species at that season. Other factors are the character or disposition of the species, and its wing power, and more especially the quest for suitable nesting and breeding places. This is satisfactory for the southward movement. It is more difficult to account for the almost unerring instinct or series of reflex activities, if one pleases, which lead the old and young birds to fly back to their birthplace. Is the initiative due to the sexual reflexes and instincts? and after the flocks are once started are they guided by the memory of the landmarks observed in their southward flight in the previous autumn? also does the increasing warmth of tropical regions at the end of winter, for example in northern Africa, Central America and the West Indies, urge them gradually to make their way northward as spring opens? We know that the migratory fishes, the salmon, cod, herring, etc., which live in deep waters in winter gradually as spring arrives and the shallower water becomes warmer, migrate inshore. The change of temperature also affects the sexual organs or glands, the eggs ripen, and this may incite them to seek spawning grounds near shore.

As for the cause which guides them along their accustomed routes, we can see that they are in part mechanical, due to reflex action, thermotropism, etc., and other tropisms, in response to changes of season, etc.; to obvious and safe routes, to the absence of physical barriers, while in fact they are guided by what is called the homing instinct, which is simply the result of observation and memory. If a limpet or crab will find its way back to its station, how much more readily should so keen and intelligent a creature as a bird be able to retrace its flight over a route which it had traveled a few months previous. To invoke a sixth sense, "the sense of direction," seems quite unnecessary considering the bird's keen senses, its power of memory, together with the stimulus of the approaching mating season; hence we need not regard the return migratory flights as especially mysterious. A bee returns to its hive; a cat, dog, or horse travels back long distances to its accustomed haunts, orientating itself by the simple exercise of the acute senses with which it is endowed, plus the memory of land marks observed along the way.

Migrations of other Animals.—Whales, especially the sperm whale, have their regular migrations along the northeastern coast of North America and elsewhere, to and from the polar regions. The barren ground caribou migrates north at the beginning of summer, and southward in autumn. The Arctic fox in the Hudson Bay region is known to retreat southward in October, returning northward in the spring. There are also cases of sporadic and sudden migratory movements by squirrels, lemmings (q.v.), rats, mice, bison, antelopes, quaggas, etc. Among insects the migratory locusts come to mind. The Rocky Mountain locust is migratory in certain seasons favorable to the species when overproduction occurs; the young on hatching, after having devoured every green thing at hand, are forced, when becoming winged to rise in enormous swarms and sail on the wings of the wind for hundreds of miles to other regions where they lay their eggs. The next year's brood sometimes returns to the original spawning ground to lay their eggs.

Certain butterflies, as *Anosia plexippus*, and the cotton moth (*Aletia argillacea*) pass northward for hundreds of miles. Among other butterflies periodical migrations occur, as in movements of vast columns across the Isthmus of Panama out to sea, and flights miles in breadth have been observed to cross Ceylon, the individuals occupying several continuous days in their passage. Wallace observed the swarming of pierid butterflies in the Indian Ocean, and Clark in Venezuela, the vast throng composed of males moving steadily eastward for several days in the face of the trade winds.

Human Migrations.—Man probably originated in southeastern Asia at a time when Java was united to the mainland. From thence as he multiplied, and as the result of over-population, waves of migration spread over the highlands and interior of Asia, westward into Europe, and southward into Africa. Probably the North American Indians crossed from northeastern Asia into northwestern America. After the primary races became fixed, the white races of Europe and the Mediterranean region moved in successive waves of secular migration toward the Atlantic. The Anglo-Saxon people, as the result of over-population in the limited area between the mouth of the Rhine and Elbe, have spread over the world. But the yellow races have never passed far west of their present habitat.

Migrations in Geological Times, or Secular Migrations.—Owing to widespread geographical changes in Mesozoic and Tertiary times vast migrations took place. Thus the elephant order which it is now supposed originated in the Eocene epoch in Egypt, emigrated in later times into southeastern Europe and, spreading over Asia, reached North America by way of what is now Bering Strait, then a bridge of dry land, finally passing down in Pliocene times into South America. The camel family originating in western North America, sent waves of migration into South America, and also into Asia. The land-connection between what is now North America, Greenland, Iceland and Europe-Asia, allowed of further migrations and interchanges of mammals and doubtless of the lower animals. For example, in Miocene times America borrowed the bears, deer and cattle from Eurasia, but sent in exchange the tapirs, sabre-toothed tiger, rabbits and hares to what is now the Old World. As soon as the Isthmus of Panama connected North and South America extensive inter-migrations took place. Many of our insects, and birds, and mammals are of South and Central American origin. In the southern land (Antarctogaea) there were most probably during the Mesozoic and Tertiary periods land-connections between South America and Africa, and between Africa and Australia, and possibly there was a great antarctic land connecting these continents, or at least South America and Australia. These movements and migrations were the result of widespread geographical and topographical changes, involving the evolution, extinction and inter-migration of vast assemblages of plant and animal forms.

Consult Newton, article "Migration" in 'Dictionary of Birds' (London 1893-6); also the writings of Baird, Brewster, Cooke, Palmen, etc.

ALPHEUS S. PACKARD,

Professor of Zoology, Brown University.

Miguel, mē-gēl', **Dom Maria Evaristo**, Portuguese pretender, son of John VI. of Portugal; b. Lisbon 26 Oct. 1802; d. Castle Brunnbach, Baden, 14 Nov. 1866. He was brought up in Brazil, and upon the accession of his father repeatedly raised rebellion as head of the Absolutists. In 1826 after his father's death he was made regent, but proclaimed himself king, attempted to keep Maria de Gloria, the real heir to the throne, who had been offered to him in marriage, out of the kingdom, and was successful until Dom Pedro of Brazil came to the aid of his daughter Maria, defeated Miguel and forced him to leave Portugal. Miguel is usually described by the faction hostile to him as ignorant, vicious and drunken, but his co-religionists make him a model prince.

Mijatovich, mē-yā'to-vich, **Chedomille**, Servian statesman and diplomat; b. Belgrade, Servia, 1842. He was educated at the universities of Munich, Leipsic, and Zürich, and in 1865 was professor of political economy at the High College of Belgrade. In 1869 he was general secretary in the ministry of finances and has continued in public life. He has been a senator since 1875, minister of finance, commerce, foreign affairs, delegate to various international conferences and ambassador to England in 1884, to Rumania in 1894 and again to England 1895-1900.

Mika'do (Japanese *Mi*, "exalted," *Kado*, "gate"), the ancient and poetic title of the Japanese emperor, in origin identical with "Sublime Porte" as used of the Ottoman sultan, that is, probably transferred to the ruler and judge from the gateway of his palace, at which he did justice. The word mikado was never used as a separate title for a spiritual ruler; the incorrect idea to the contrary results from the well-known historical fact that much of the temporal power of the mikado was long usurped by shoguns or generals, who, however, always admitted that they derived their power from the mikado. The present mikado, Mutsuhito (q.v.), is the 121st (or 123d) of his line, which dates back to 660 B.C.; of him the title "Mikado" is less used than Tenshi Sama, "Son of Heaven," or Shu-jo, "Supreme Master." See JAPAN.

Milan (mil'ān) **I. Obrenovitch**, ō-brēn'ō-vich, king of Servia; b. Jassy, Moldavia, 22 Aug. 1854; d. Vienna 11 Feb. 1901. In 1872 he began to govern as Prince Milan IV. He declared war against Turkey, suzerain power of Servia, in 1876, but was consistently defeated, and gained peace and security only by Russian interference. Having participated in the Russo-Turkish war, Servia was recognized as independent in 1878, and in 1882 proclaimed itself a kingdom, with Milan as ruler. In 1885, upon the union of Bulgaria and Eastern Rumelia, Milan made an invasion of Bulgaria, but was quickly driven back, and defeated at Slivnitza in Servia. This time Austria intervened to save his throne. On 6 March 1889 he abdicated and proclaimed his son Alexander king under the regency of himself. In 1892 he renounced the regency and took the title Count Takovo, and in 1898 was made generalissimo of the Servian army, though soon deprived of the post and banished from Servian territory. In 1875 he married Natalie Kechko, daughter of Colonel Kechko of the Russian army, from whom he was afterward divorced.

Milan, mil'ān or mī-lān', Italy, the capital of the province of Milan, an archiepiscopal city on the Olona, about 90 miles by rail northeast of Turin. It is situated in a beautiful and fertile plain between the Adda and Ticino, which feed several canals, one of which, encircling a considerable portion of the interior of the city, divides it into two unequal parts. The town is built in the form of an irregular polygon, and is surrounded, except on the castle side, by a wall or rampart called the Bastione, encircled on the outside by a fine road shaded by chestnut-trees. Suburbs have sprung up beyond this circuit, and the general railway-station is also outside. The city is entered by 11 gates, several of which are magnificent. The streets leading from these gates are wide, well paved, and lighted and traversed by electric street car lines; the lateral streets are less commodious. The houses are built mostly of brick, but have often a handsome and showy exterior. The principal street is the Corso Vittorio Emanuele, a prolongation of the new and handsome Corso Venezia, together leading from the cathedral to the Porta Venezia; other good streets are the Corso Porta Romana, Via Torino, Via Dante, etc. The chief square is the Piazza del Duomo, in which stands the Duomo or cathedral; and another is the Piazza della Scala. Besides fine public gardens (Giardini Pubblici) there is a large public park (Parco Nuovo) occupying an area that was long a drill-ground, and was previously the site of the citadel and connected works. This has been finely laid out and planted, and an artificial lake and mound have been constructed. Adjoining these is an amphitheatre, capable of containing 30,000 spectators. The castle—recently restored and now converted into a museum of art and antiquities—fronts the park on one side; at the opposite side is the Porta Sempione with the fine Arco Sempione or Arco della Pace, a triumphal arch of white marble.

Among the public edifices of Milan the first place belongs to the Duomo or cathedral, a magnificent structure, inferior in magnitude to St. Peter's at Rome, but in some respects not an unworthy rival. It is built of white marble, and though exhibiting a somewhat incongruous mixture of styles, in which the ancient Gothic occasionally gives way to the modern Italian, is one of the most impressive ecclesiastical edifices in the world. The Duomo in its present form was commenced in 1387, and is not yet entirely completed. Its form is that of a Latin cross, divided into five naves, terminated by an octagonal apsis, and supported by 52 octagonal pilasters of uniform size, except four, which, having to bear the cupola, are larger. Around the exterior are 4,500 niches, of which above 3,000 are already occupied by statues; in the interior everything is of the most imposing and gorgeous description. Among the other remarkable edifices are the church of Sant' Ambrogio, founded by St. Ambrose in 387, and though completely repaired in 1631, still retaining much of its original form, and containing many relics of the ancient building embedded in its walls; the churches of Sant' Eustorgio, San Lorenzo, Santa Maria della Grazie, with a cupola and sacristy by Bramante, and the celebrated 'Last Supper' by Leonardo da Vinci; Santa Maria della Passione, a majestic edifice, with excellent paintings and a magnifi-

MILAN—MILAZZO

cent mausoleum; San Paolo; San Carlo Borromeo, etc. Among the palaces are the Palazzo Reale or La Corte, adorned with numerous frescoes and surmounted by a lofty tower; the archiepiscopal palace, adjoining the cathedral; the Palazzo di Comando Militare; the Palazzo Marino, now the Municipio, a colossal structure; the Palazzo Ciani, completed in 1861, and adorned with heads of Victor Emmanuel, Garibaldi, etc.; and the Palazzo di Brera or Delle Scienze Lettere ed Arte, containing the Pinacoteca or picture-gallery, with a very valuable collection of paintings and statuary, and containing also the library of the Academy, 300,000 volumes. Besides this library Milan possesses the Ambrosian Library, the earliest, and still one of the most valuable public libraries in Europe. There is also a valuable museum of natural history, a conservatory of music, a military college, a theological seminary, and a veterinary school. The principal structure erected in recent times is the Galleria Vittorio Emanuele, a kind of covered street connecting the Piazza del Duomo with the Piazza di La Scala Theatre. It is 320 yards long, contains handsome shops, and is adorned with 24 statues of celebrated Italians. Milan has a number of theatres, among which that called La Scala takes precedence, accommodating 3,600 spectators. The principal benevolent endowments are the Ospedale Maggiore, richly endowed, and occupying a vast range of buildings in the Gothic style, with accommodation for 2,000 patients; several other hospitals for the cure of diseases, or the reception of the poor; and a vast lazaretto just outside the rampart. Since it formed part of United Italy no town has more rapidly increased in commercial and industrial activity than Milan. The spinning and throwing of silk employ a large number of hands. Other important articles of manufacture are machinery, locomotives and railway cars, boilers, electrical apparatus, tobacco, cotton, lace, carpets, hats, earthenware, white-lead, jewelry, etc. Besides these, corn, rice, cheese, and wines are the principal articles of trade. It is the see of an archbishop, the seat of courts of primary resort, criminal and mercantile courts, and a court of appeal for all Lombardy. The United States is represented by a consul.

The foundation of Milan is attributed to the Insubrian Gauls; but the first distinct notice of it occurs 221 B.C., when it was subdued by the Romans, under whom it acquired so much importance, that in the division of the empire attributed to Constantine the Great it ranks as the second city of Italy. In the middle of the 5th century it was sacked by the Huns under Attila, and again in the following century by the Goths. Greater horrors yet awaited it; and the Goths, who had been driven out by Belisarius, having regained possession by the aid of the Burgundians, gave it up to the flames, and put almost all its inhabitants to the sword. Having been rebuilt it again became very flourishing under the Lombards and Charlemagne. Arrogance grew with its prosperity, and Milan lorded it so haughtily over the neighboring towns and republics, that in 1162, when the Emperor Frederick I., whose supremacy it refused to acknowledge, had resolved to take summary vengeance, the inhabitants of Pavia, Cremona, Lodi, Como, and Novara eagerly hastened to the task, and razed it to the ground. The cru-

elties practised produced a reaction, and in 1167 the famous Lombard League was formed at Pontida, and among other important results succeeded in bringing back the Milanese; and the city again rebuilt became even more populous and influential than before. It long continued, however, to be torn by internal factions, headed by the leading nobility, among whom the Visconti at last gained the ascendancy, and ruled it from 1395 till 1447. They were succeeded by the Sforzas, whose rule ended in 1535. Milan passed next into the possession of the Spaniards. At the close of the war of Succession it was allotted to Austria (1714). Under Bonaparte it became the capital of the Cisalpine Republic, of the Italian Republic, and of the Italian Kingdom. In 1815 it was restored to Austria, and continued the capital of the Austro-Italian Kingdom until 1859, when by the Peace of Villafranca Lombardy was ceded to Piedmont. Pop. (1901) 491,460.

Milan, mī'lan, Mo., town, county-seat of Sullivan County; on the Quincy, O. & K. C. and the Chicago, B. & K. C. R.R.'s; about 100 miles east by north of Saint Joseph. It is in an agricultural and stock-raising region, and in the vicinity of bituminous coal fields. The chief manufactures are flour and lumber. Milan is the headquarters of a division of the Quincy, Omaha & Kansas City railroad, and the shops of the road are located here. The trade is principally live-stock, grain, lumber, and flour. Pop. (1890) 1,234; (1900) 1,757.

Milan, Tenn., city in Gibson County; on the Illinois Central and the Louisville & N. R.R.'s; about 95 miles northeast of Memphis. It is in an agricultural and lumbering region; the principal products are cotton and fruit. The chief manufacturing establishments are flour-mills, fruit-canning works, cotton gins, and barrel factory. It has a college and good schools. Pop. (1890) 1,546; (1900) 1,682.

Milan Decree, issued by Napoleon I., at Milan, 18 Feb. 1801, cutting off Great Britain from all connection with the Continent.

Milan Edict, issued by Constantine the Great at Milan, 313 A.D., granting toleration to Christianity and all other religions in the Roman empire.

Milanés y Fuentes, José Jacinto, hō-sā' yā-kēn'to mē-lān'ās ē fwān'tās, Cuban poet: b. Matanzas 16 Aug. 1814; d. there 14 Nov. 1863. He was self-taught, being a poor clerk and later a blacksmith's helper. But when he was 19 some of his verses were published, and his excellent drama, 'El Conde Alarcos,' which appeared in 1838, won him a comfortable position. Several other plays followed, notably 'Una Intriga paternal.' But his early hardships had undermined his reason; he traveled for relief in the United States and in Europe in 1848 and 1849, and spent his last years in melancholia broken only occasionally by intelligent literary effort. Consult the biographical sketch in the 'North American Review' for 1849.

Milazzo, mē-lāt'sō, or **Melazzo**, Sicily, a fortified seaport city in the province of Messina, on a promontory 21 miles by rail west of Messina. It has a good harbor and carries on a trade in fruit, wine, cattle, fish, and sulphur. Milazzo is the ancient Mylæ off which in 260

MILBURN — MILEAGE

a.c. the Romans won a great sea-fight over the Carthaginians. Here also Garibaldi, 20 July 1860, with 2,500 men, defeated 7,000 Neapolitans, and compelled the garrison to evacuate the fortress. Pop. (1901) 16,422.

Mil'burn, William Henry, American clergyman: b. Philadelphia 26 Sept. 1823; d. Santa Barbara, Cal., 10 April 1903. At 5 he suffered an accident which caused partial and finally complete loss of sight. He was educated at Illinois College (Jacksonville, Ill.); in 1843 became a Methodist itinerant preacher; was largely active in the South; and for a time had charges at Montgomery and Mobile, Ala. In 1845 he was elected chaplain of the House of Representatives, and he served as such in 1853, 1885 and 1887. In 1893 he was made chaplain of the Senate. He lectured with success throughout the United States and in 1859 in Great Britain. He was generally known as the "blind preacher." Among his writings are: 'Rifle, Axe, and Saddle-Bags' (1857); 'Ten Years of Preacher Life' (1859); and 'Pioneers and People of the Mississippi Valley' (1860), all based on his Western experiences.

Mil'dew, specifically, any fungus belonging to the group *Erysiphaceæ*, the powdery or true mildews, and *Peronosporaceæ*, the downy or false mildews; loosely, many plant diseases, especially the rusts and smuts of cereals, and some not of fungous origin; vaguely, molds of any kind upon preserved fruit, clothing, walls, or other materials, the origin of which is more or less organic. The powdery mildews develop mostly upon the outside of the host plants, which they enter only by means of their sucking organs of attachment (haustoria). In warm weather they develop innumerable spores upon erect branches and later produce thick-walled resting spores which germinate in the spring. Upon the host plants they usually appear as a sort of bloom, but later they often cause distortion of the leaves and not infrequently the death of the host. Being mainly upon the surface they may be combated with any fungicide (q.v.), and often with sulphur, either in the form of powder or vapor (not burned) evaporated without flame. This method is widely practised in greenhouses. Some of the best known are rose mildew (*Sphaerotheca pannosa*), gooseberry mildew (*S. mors-uvæ*), hop mildew (*S. castagnei*), cherry, pear and apple mildew (*Podosphaera oxycantha*), wheat mildew (*Erysiphe graminis*), and grape mildew (*Uncinula spiralis*).

The downy mildews all live within the tissues of the host plant, appearing outside the surface only when producing summer spores (conidia) which usually give a downy appearance to the infected spots. The resting spores are produced internally and make their escape in the following season when the tissues of the host (leaf or other part infected) have decayed. They cannot be combated like the preceding, because of their habit of feeding internally. Fungicides (q.v.) may be applied to prevent attacks, however, and this, together with the destruction of leaves in autumn and general cleanness of the premises are believed to be the only safeguards. Among the best known and most destructive are: Potato rot, blight, or mildew (*Phytophthora infestans*), lettuce mildew (*Bremia lactuæ*), damping-off fungus

(*Pythium debaryanum*), downy mildew of the grape (*Plasmopara viticola*), radish mildew, also found on other members of the *Crucifera* (*Cystopus candidus*), melon and cucumber mildew (*Plasmopara cubensis*) and onion mildew (*Peronospora schleideniana*).

The rusts and smuts which are sometimes called mildews are discussed elsewhere. The mildews, so-called, which appear upon leather, wall-paper, cloth, etc., belong to various other groups. Since they are generally seen only where dampness prevails, especially in cellars and closed rooms or houses, they may be prevented more or less effectually by the adequate ventilation of such places. And having gained a foothold in these places they may be destroyed by liberal applications of whitewash, in which copper sulphate or sulphur have been mixed, or where this cannot be applied, by burning sulphur in the closed quarters. This last remedy may also be used where cloth is attacked. Awnings, sails, etc., should be thoroughly dry before being stored or folded for any considerable time. They may also be soaked in a solution of copper sulphate and then dried. Until this is washed out by rain it will act both as a preventive of attack and will often save fabrics if not too far gone.

Mile (Latin *mille*, a thousand, a Roman mile being 1,000 paces), a measure of length or distance. The English statute mile, fixed in the reign of Queen Elizabeth, is 1,760 yards. The geographical mile, which is commonly used by the navigators of all nations, is one sixtieth part of a degree at the equator. In many countries the kilomètre (kilometer) now holds the same position as the English statute mile in Britain. The following are some of the principal standards of miles or leagues which are or have been in use in the principal countries of Europe:

Kilomètre	1,093.6 yards.
Ancient Roman mile	1,614 "
Modern Roman mile	1,628 "
English statute mile	1,760 "
Tuscan mile	1,808 "
Ancient Scottish mile	1,984 "
Geographical mile	2,028.4 "
Italian mile	2,028.4 "
Irish mile	2,240 "
French posting league	4,633 "
Spanish league (judicial)	4,635 "
French league	4,860 "
Portuguese league	6,760 "
German short mile	6,859 "
Flanders league	6,864 "
Spanish league (common)	7,416 "
German geographical mile	8,113.6 "
German (new imperial)	8,202 "
Old Prussian mile	8,237 "
Danish mile	8,244 "
Swiss mile	9,153 "
German long mile	10,126 "
Swedish mile	11,700 "

The English statute mile is generally used in the United States.

Mileage, a term used in the United States, for fees paid to certain officials, such as members of Congress, of State legislatures, special commissioners and others, for their traveling expenses, at so much per mile. The system has led to gross abuses, each senator and representative estimating for himself the distance he had traveled. There is now a fixed table of mileage, and the total annual cost, for both houses of Congress, is nearly \$150,000. In all countries of Europe, except Great Britain, the same system prevails with regard to members of the popular chambers, at least, they being

LIEUTENANT-GENERAL NELSON APPLETON MILLS

MILELLI—MILETUS

paid either their traveling expenses or a fixed annual sum. The term mileage is also applied in the United States to railroad transportation, sold in tickets good for 1,000 miles of travel. These tickets are issued in book form, convenient for the pocket, and are known to travelers as mileage books. In 1903, a system of interchangeable mileage tickets were issued, good for transportation on any one of eight different railroad lines in the Eastern States.

Milelli, Domenico, dō-mā'nē-kō mē-lē'lē ("CONTE DI LARA"), Italian poet: b. Catanzaro, Italy, 1841. He was educated for the priesthood, but finding literature more to his liking turned his attention to writing, which is in subject of a paganish character, and he is one of the leaders of the class called *Veristi*. Among his works are: 'In giovinezza' (1873); 'Odi pagane' (1879); 'Il rapimento di Elena' (1882); 'Verde antico' (1885).

Miles, George Henry, American dramatist: b. Baltimore, Md., 31 July 1824; d. Thornbrook, Md., 23 July 1871. He was graduated from Mount St. Mary's College, Emmitsburg, Md., and practised law in Baltimore for several years, after which he devoted himself to literature. In 1850 his 'Mohammed' was awarded the \$1,000 offered by Edwin Forrest for the best drama by an American author. In 1859 he was appointed professor of English literature at Mount St. Mary's College, where he remained until his death. His works comprise: 'Señor Valiente' (1850); 'Christine, a Troubadour's Song' (1866); 'Abu Hassan the Wag' (1868), etc.

Miles, Nelson Appleton, American army officer: b. Westnunster, Mass., 8 Aug. 1839. He was a clerk in a Boston mercantile house at the outbreak of the Civil War in 1861; and left his business to raise a company of volunteers, and enter the army as lieutenant in the 22d Massachusetts regiment. In 1862 he was promoted to the rank of colonel, commanding the 61st New York regiment. He was engaged in the battles of the Peninsula, before Richmond, and at Antietam, and in every battle of the Army of the Potomac, with one exception, until the surrender of Lee at Appomattox Court House. He was distinguished in the battles of Fair Oaks, Malvern Hill, Fredericksburg, Chancellorsville, Wilderness, Spottsylvania Court House, Reams Station, Richmond Campaign of 1864, and many other important battles of the war; and, at one time, at the age of 25, was in command of the Second army corps, numbering 25,000 men. He was wounded three times, most severely at the battle of Chancellorsville. In May 1864 he was promoted brigadier-general, and in 1865 major-general of volunteers.

At the close of the war he entered the regular army and was commissioned colonel of the 40th United States infantry; and attained the rank of brigadier-general in 1880, and of major-general in 1890. He successfully conducted several important campaigns against the Indians, and did much to open up for civilization large portions of the West. In 1874 and 1875 he defeated the Cheyennes, Kiowas, and Comanches in the Staked Plains country; he also subjugated the hostile Sioux and other Indians in Montana, driving Sitting Bull across the frontier and breaking up the bands that

were led by him and other chiefs. In December 1877, after a forced march over a distance of more than 160 miles, he captured Chief Joseph and his tribe of Nez Percés after a hard-fought battle of four days in northern Montana; in 1878 he intercepted and captured Elk Horn and his band on the edge of the Yellowstone Park. In 1886 he subjugated and forced to surrender Geronimo, Natchez and the band of Apaches that had made a large portion of the Southwest uninhabitable, thus restoring peace and prosperity to Arizona and New Mexico. For his services up to this time he received the thanks of the legislatures of Kansas, Montana, New Mexico and Arizona. Later he settled the Indian troubles in the Dakotas, saving the country from a serious war that had threatened it for years. In 1894 he was in command of the United States troops sent to Chicago at the time of the railroad strike; and in October 1895 succeeded to the command of the United States army. He represented the army at the scene of the Turco-Grecian war, and at Queen Victoria's Diamond Jubilee in 1897. In 1898 he conducted the brief campaign in Porto Rico with ability, taking possession of the island with trifling loss; and in June 1900 was promoted to the rank of lieutenant-general. In December 1901 he was officially reprimanded for publicly expressing his approval of Admiral Dewey's report on the Schley case. In 1902 he made a tour of inspection to the Philippines, and on his return filed a report which called forth considerable controversy by its denunciation of some of the abuses he had found in the conduct of military affairs there. In August 1903 he was retired from active service. He has written 'Personal Recollections' (1896); 'Military Europe' (1898), besides magazine articles and official military reports.

Miles O'Reilly. See HALPINE, CHARLES GRAHAM.

Milesians, mī-lē'shī-anz, or mī-lē'zhanz, early colonists of Ireland, a portion of whose inhabitants, according to Irish tradition or legend, are descended from Milesius, a fabulous king of Spain, whose two sons conquered the island several thousand years before Christ, establishing a new nobility. This was the last of the traditional prehistoric colonizations of Ireland.

Miletus, mī-lē'tūs, Asia Minor, an ancient city opposite the mouth of the Meander on the Latmic Gulf, which, inhabited by Carians, was in existence prior to the colonization of the coast by the Ionians. The Ionians are said to have taken forcible possession of the town, massacred the men, and taken the women as their wives. The extent of the harbors of Miletus, one of which could contain a large fleet, soon raised the town in the hands of the Ionians to a place of importance, and it became one of the first cities and republics of Asia Minor. Its commerce covered the Mediterranean, and extended to the Atlantic. It had upward of 75 colonies, most of which were on the coasts of the Euxine. On the rise of the Lydian kingdom repeated attempts were made to conquer it. It finally recognized the sovereignty of Croesus, and paid tribute. A similar arrangement was made with Cyrus, which saved it the calamities of a contest with the Persians. Civil dissension, however, had long been rife. The Persians

MILFOIL — MILFORD

were compelled to intervene, and committed the government to the most peaceable land-owners. The city revolted against the Persians 500 B.C. It was taken by storm 494 B.C., was plundered, and the inhabitants massacred or transported. It recovered its independence in 479 B.C., after the battle of Mycale. It yielded for a time to the supremacy of Athens, but ultimately threw off the yoke. It stood an assault by Alexander the Great 334 B.C., part of the city was destroyed, but the conqueror did not interfere with its government. From the time of its subjugation by the Persians it had never recovered its early importance; but it still continued to enjoy some commercial prosperity under the Romans until the time of St. Paul, who visited it twice, as recorded in Acts xx. 17 and 2 Tim. iv. 20. It was finally taken and destroyed by the Turks. From the change made on the coast by the deposits of the river the site of the city was with difficulty excavated by the Berlin Museum in 1899, and the foundations of various parts of the city exposed.

Mil'foil, or Millefoil. See YARROW.

Milford, mil'förd, Conn., town, in New Haven County; at the mouth of Wepowaug River, on Long Island Sound, and on the New York, N. H. & H. railroad; about 10 miles southwest of New Haven. The place was settled by people from Wethersfield and New Haven in 1639. The Indian village was called Wepowage. Milford became a part of the "Colony of New Haven" in 1644, and in 1664 the town became a part of Connecticut. The chief industries are oyster cultivation, farming, seed-growing, the manufacturing of electrical supplies, telephone apparatus, shoes, straw hats, and silverware. It has a beautiful, well-kept park, several fine churches and school buildings, and the Taylor Library, which has about 10,000 volumes. In 1889, on the 250th anniversary of the settlement of Milford, a Memorial Bridge was erected. Pop. (1890) 3,811; (1900) 3,783.

Milford, Del., town, in Kent and Sussex counties; on Mispillion River, and on the Philadelphia, B. & W. railroad; about 62 miles south of Wilmington. A settlement was made here in 1678-9 and in 1787 the town was incorporated. It is the trade centre for a fertile agricultural region in which fruit growing receives special attention. The industries of the town are connected with the farm and orchard products. Pop. (1890) 2,565; (1900) 2,500.

Milford, Mass., town, in Worcester County; on the Charles River, and on the New York, N. H. & H. and the Boston & A. R.R.'s; about 17 miles southeast of Worcester. It was settled in 1669 and was then a part of the East Precinct of Mendon. On 11 April 1780 it was incorporated as a separate town. It is in an agricultural region, but the town has considerable manufacturing interests. In the vicinity are large granite quarries. The chief manufactures are foundry and machine-shop products, silk, boots and shoes, thread, boot and shoe trees, straw goods, and bone cutters. The granite quarries contribute to the industrial wealth of the town. The town has a fine high school, good public and parish schools, and a public library. Town meetings, held usually twice a year, administer the government. Consult 'History of the Town of Milford.'

Milford, N. H., town, in Hillsboro County; on Souhegan River, and on the Boston & M. and the Fitchburg R.R.'s; about 27 miles south by west from Concord, and 15 miles southwest of Manchester. The chief industries are connected with manufacturing, quarrying granite, lumbering, and agriculture. The principal manufactures are flour, leather, lumber, piano keys, harnesses, furniture, quarry machinery, soap, paper boxes, wagons, and carriages, and dairy products. The trade is in the manufactured articles, farm products, and granite. Pop. (1890) 3,014; (1900) 3,739.

Milford, Pa., town, county-seat of Pike County; on the Delaware River, and on the Erie railroad; about 45 miles east of Scranton and 8 miles southwest of Port Jervis. It is situated in a portion of the Delaware Valley noted for its beautiful and picturesque scenery. The Sawkill Falls and the Cliffs are in the vicinity, and on the northwest and south of the town are mountains. Three miles south are the falls of the Raymonds Kill and 14 miles south are the cataracts of Big and Little Bushkill creeks. Milford is one of the pre-Revolutionary places, but it was not made a separate township until 1800. It is a favorite resort for hunting parties. Many of the legends and stories connected with the place may be found in 'Pike County Ballads,' by E. Mott. Pop. (1900) 884. In summer the population is over 6,000.

Milford, Wales, a seaport town of Pembrokeshire on the celebrated Milford Haven, one of the safest, deepest, and most capacious harbors in Britain, forming a deep indentation in the southwest coast of the county. The haven stretches about 10 miles from east to west, with a breadth of from one to two miles, and branches off into numerous bays, creeks, and reaches. The largest vessels can enter and put to sea in any wind or at any tide more expeditiously than from almost any other large harbor in Great Britain, and it has long been proposed to make Milford the eastern seat of the transatlantic trade, as bringing London nearer by several hours. The haven is defended by fortifications. The town of Milford on the north shore, eight miles northwest of Pembrokeshire and six miles from the mouth of the haven, has extensive modern docks and a busy agricultural and domestic trade with Irish ports. Pop. (1901) 5,101.

Milford, Engagements at. Milford, Va., on the east bank of the south branch of the Shenandoah, was the scene of several skirmishes and three cavalry engagements during the Civil War. On 24 June 1862 detachments of the 1st Maine and 1st Michigan cavalry attacked about 300 mounted Confederate infantry at the place, without decisive result, and withdrew. When Sheridan, after the battle of the Opequon (q.v.), followed Early up the valley, he ordered Gen. Torbert, commanding the cavalry, up the Luray Valley, to get past Early's right and cut off his retreat. Wilson's division advanced and 21 Sept. 1864 attacked Wickham's cavalry division of two brigades and drove it from Front Royal and up the valley to Milford, where Wickham took up a strong defensive position on the south side of Milford Creek, one flank on the Shenandoah and the other on a knob of the Blue Ridge. When Torbert came up on the 22d he

MILFORD — MILITARY ACADEMY

concluded that the position was too strong to be attacked, and not knowing that Sheridan had attacked Fisher's Hill (q.v.) fell back to near McCoy's Ferry, again advancing, and on the 23d occupying Milford, which had been abandoned by Wickham. Sheridan was greatly disappointed at Torbert's failure to carry the place on the 22d. After the battle of Cedar Creek (q.v.) 19 Oct. 1864, Milford was occupied by Lomax's Confederate cavalry division, and its defenses strengthened. On 24 October Powell's cavalry division, two brigades of about 1,100 men, with six guns, moved up the Luray Valley to reconnoiter. Powell skirmished with Lomax's outposts on the 25th, and on the morning of the 26th attacked Lomax in position at Milford, using his artillery freely, and continuing the contest until 2 p. m., when, finding the defense so stubborn and the position too strong to be carried, he withdrew.

E. A. CARMAN.

Milfort, Le Clerc, læ klärk mël-för, or mël-fört, French adventurer: b. Mezières, France, about 1750; d. there 1817. He came to America, traveled through the colonies, and about 1776 visited the Creek Indian nation. Here he attached himself to the Creek chieftain, Alexander McGillivray, whose sister he married. He was made a war chief by the Indians, was called *Tastanegy*, or "great warrior," and was in active service against the Whigs of Georgia during the Revolution. He remained with the Creeks for 20 years. In 1796 he returned to France, and was made a general of brigade by Bonaparte. He wrote, or perhaps merely furnished material for, the interesting *Mémoires, en Coup-d'œil Rapide, sur mes Voyages dans la Louisiane, et mon Séjour dans la Nation Creeke* (1802).

Milia'ria (MILIARY FEVER, MILLET-SEED RASH, PRICKLY HEAT), a very common fine papular or papulovesicular eruption. It is caused by too profuse sweating attended by undue congestion of the skin. Hot weather, excessive clothing, vigorous exercise, alcoholic dissipation commonly evoke the disease, especially in those who are debilitated or who have a delicate skin. It may appear and disappear rapidly without any apparent cause. Its appearance is attended by pricking, burning, or itching sensations. It is generally limited to a portion of the trunk, but may appear upon the face, neck, and extremities. Fresh crops may follow one another. In subsiding the vesicles become opaque and yellowish white.

Miliary Fever. See MILIARIA.

Milicz, mē'lich, or **Militz**, Johann, Moravian reformer: b. Kremsir, Moravia, about 1325; d. Avignon, France, 29 June 1374. He entered the Roman Catholic priesthood in 1350 and in 1360 became canon at the Cathedral of St. Vitus in Prague, and was appointed secretary to Charles IV., who took him to Germany. Becoming convinced of the hollowness of court and church life, in 1363 he resigned and began to preach to the lower classes in Prague in their own tongue, instead of the Latin, and gained over them a wide influence. Convinced that Antichrist had arrived and that the day for reform was at hand, he went to Rome that he might consult the pope, and was arrested by the Inquisition, but was released, and was well received by Urban V. Upon his return to

Prague he resumed his preaching, but in 1372 he was accused of heresy by his brother priests and summoned to Avignon for trial. He proved his innocence, but died before the verdict was rendered. Consult Palacky, *Die Vorläufer des Hussitentums* (1869).

Military. See ARMY; ARMY OF THE UNITED STATES.

Military Academy, Royal, an institution at Woolwich, England, where candidates for the Royal Engineers and the Royal Artillery of the British army receive their finishing education. See MILITARY SCHOOLS.

Military Academy, United States. From the first outbreak of the War of the Revolution the necessity for trained artillerymen and engineers was manifest. The want was supplied so far as possible by importing foreigners, chiefly Frenchmen. It was evident from the first also that the United States should maintain a school for educating Americans for command and especially for the regular duties of the scientific branches of the service. Two plans were suggested; the first was to establish a military academy with a fixed home, where pupils (cadets) would be educated chiefly in the theory of war, leaving the practice to be gained in actual service; the second was to organize a school of practice for young officers who would also study the theory of their profession. General Henry Knox, chief of artillery, was the first to propose the former plan which is that on which the United States Military Academy is organized. In a report to a committee of Congress (27 Sept. 1776) he advocated an Academy "nearly on the same plan as that of Woolwich." Knox's views were afterward supported by Alexander Hamilton, and approved by General Washington. The plan of Knox was not carried out until 1802 when the United States Military Academy was established at West Point. The alternative plan was adopted in 1777.

The occupation of West Point as a military post took place 20 Jan. 1778, and has been continuous since that date. As early as 1 Oct. 1776, Congress passed a resolution appointing a committee to prepare a plan for "A Military Academy at the Army." The result was the resolution of 20 June 1777, providing for a Corps of Invalids (veterans) "to serve as a military school for young gentlemen previous to their being appointed to marching regiments." The Invalid Corps was organized in July 1777, and in 1781, at the request of Washington, was marched from Philadelphia to form part of the garrison at West Point, where an engineer school, a laboratory, and a library had been established in three separate buildings. In 1783, after the cessation of hostilities, Washington, having been called upon for his views as to the peace establishment, laid the matter of a Military Academy before his officers at Newburg. He referred to it again in his message of 3 Dec. 1793. The law of 9 May 1794 authorized the organization of a Corps of Artillerists and Engineers with two cadets to a company, thus creating the new grade of "cadet" in the American army. A school for the artillerists and engineers and for the cadets attached to them was established, on the recommendation of Washington, by order, at West Point, in 1794. The destruction of its buildings by fire in 1796, however,

MILITARY ACADEMY

caused its suspension. On 20 July 1801, the Secretary of War directed that all the cadets of the corps of artilleryists should report at West Point for instruction, and on 1 Sept. 1801 a school was opened with four army officers and a civilian as administrators and instructors.

Washington was firmly convinced of the necessity of establishing a Military Academy, and it was due to his efforts, and those of other patriots of the Revolution that the Academy was created by Act of Congress approved 16 March 1802. The Act authorized the President to organize and establish a Corps of Engineers to consist of five officers and ten cadets and provided that it should be stationed at West Point, in the State of New York, and should constitute a Military Academy. The Academy, with ten cadets present, was formally opened 4 July in the year of the Act.

Acts of Congress, in 1802 and 1808, authorized 40 cadets from the artillery, 100 from the infantry, 16 from the dragoons, and 20 from the riflemen; but few of these were appointed, and no provision was made for them at the Academy. In 1810 the Academy was deprived of nearly all means of instruction, and officers and cadets had difficulty in obtaining their pay. During most of the year 1811, and a part of 1812, although war was imminent, academic instruction was practically abandoned. In March 1812 the Academy was without a single instructor. Up to and including this time, 88 cadets had been graduated; they had entered without mental or physical examination, at all ages from 12 to 34, and at any time of the year.

By Act of Congress of 29 April 1812, the Academy was reorganized. The provisions of this Act have furnished the general principles upon which the Military Academy has since been conducted and controlled; a more adequate corps of professors was authorized; a maximum of 250 cadets was fixed; and the age and the mental requisites for admission were prescribed.

In 1817, under the provisions of the Act of 1812, and the able superintendency of Major Sylvanus Thayer, Corps of Engineers, the present era in the Academy's history began.

Until 1843, a prescribed residence was not a legal qualification for appointment, but the selection of one cadet from each Congressional district had grown to be customary. In this year the custom became the law, Congress prescribing that the corps of cadets should consist of one from each Congressional district, one from each Territory, one from the District of Columbia, and ten from the United States at large, to be appointed by the President.

By Acts of Congress approved 6 June 1900, 28 June 1902, and 3 March 1903, the Corps of Cadets consists of one from each Congressional district, one from each Territory, one from the District of Columbia, one from Porto Rico, two from each State at large, and forty from the United States at large, all to be appointed by the President and, with the exception of the forty appointed from the United States at large, to be actual residents of the Congressional or Territorial districts, or of the District of Columbia, or the States, respectively, from which they are appointed. Under these Acts, and under the apportionment of Members of Congress according to the 12th census, the maximum number of cadets is 522.

The total number of graduates from 1802 to 1903, inclusive, is 4,214.

Under Thayer, the Academy assumed a form which has remained essentially unchanged for nearly a century. The heads of the scientific departments (mathematics and the like) are permanent, of the professional departments (ordnance and the like) are detailed from the Army for a term of four years. The instructors in all departments are army officers detailed for the purpose—about one instructor to ten cadets. All cadets follow the same fixed curriculum and all graduates are prepared for the duties of all arms of the service therefore—a peculiarity of this school. The cadets are divided into small sections for instruction, and each is called upon to recite every day. The instruction is therefore unusually thorough, so far as it goes. A "mark" is given for each recitation and the sum of a cadet's marks determines his standing in his class. Upon this standing his first promotion in the army depends. The upper men of each class—five or more—are assigned, upon graduation, to the Engineers, the next to the Artillery, the lower half of the class to the Cavalry or Infantry. All have, however, been educated to the duties of every branch and the high excellence of the American army officer depends upon this fact.

The first object of the school is to form character. Habits of faithfulness, promptness, cheerful obedience, attention to duty first, last and all the time, are insisted on. The whole conduct of each cadet is registered by "demerit marks." Small privileges are granted for good conduct. Small punishments—such as confinement to quarters—are given for offenses. The punishments follow closely on the offense. The cadet adjusts his standard of conduct to the regulations of the Academy precisely as a child adjusts its conduct to the law of gravity. There are, for example, some 18,000 opportunities for a cadet to be late at roll call during his stay at the Academy. For every "late" he will receive one demerit. If he receives 215 for all offenses in any 12 months he is discharged. Promptness thus becomes a fixed habit, and other practical virtues are inculcated in the same way. A high standard of truthfulness and honor is insisted upon, which in the officer becomes a standard of honesty. The record of graduates in this respect is extraordinarily bright.

The services of the graduates in war are well known. Speaking of the Mexican War, General Scott said: "I give it as my fixed opinion that but for our graduated cadets, the war between the United States and Mexico might, and probably would, have lasted some four or five years, with, in its first half, more defeats than victories falling to our share; whereas, in less than two campaigns, we conquered a great country and a peace, without the loss of a single battle or skirmish."

Two hundred and ninety-one of the 4,000 graduates have become general officers. Every great battle of the Civil War except two was fought under the command of a graduate. The Army Register of 1861 contains the names of 753 graduates on the active list; 150 joined the army of the Confederacy—about 20 per cent. Nearly one half of the army officers appointed from civil life did so, and almost all the United States Senators, Representatives, Judges and civil officials appointed from Southern States.

REVIEW FOR THE PRESIDENT OF THE UNITED STATES

GUARD MOUNT—DAILY MORNING INSPECTION OF DETAIL FOR MENTEL BENT

REVIEW FOR THE PRESIDENT OF THE UNITED STATES

MILITARY ARCHITECTURE — MILITARY POSTS

The loyalty of the graduates of the United States Military Academy in that trying time, measured by percentages of the sort, was far greater than that of any other group of men except the graduates of the Naval Academy, whose record in this respect is nearly, though not quite, as good as that of the United States Military Academy. The work of the graduates in the Spanish-American War of 1898 and in the China Expedition of 1900 was admirable in every respect.

The services of graduates in civil life have been equally brilliant. In the early days of the Academy it was the chief engineering school of the country. Its graduates surveyed and located the principal railway routes and afterward constructed the roads not only of this country but of Russia and South America. Our rivers have been improved by their skill. Harbors and light-houses built by them make the navigation of our seas and lakes secure. The public domain is divided into homesteads and the coasts are surveyed by systems devised by professors in this school. Graduates in civil life have given to the country a President, four cabinet officers, one ambassador, 14 ministers to foreign courts, 12 consuls-general, 24 senators or representatives, 16 governors of States or Territories, 77 members of State legislatures, 158 officers of State militia, 17 mayors of cities, 46 presidents of universities or colleges, 32 principals of schools, 136 professors and teachers, 87 presidents of railroad and other corporations, 63 chief engineers ditto, 62 superintendents ditto, 24 treasurers or receivers ditto, 228 civil engineers, 14 judges, 200 attorneys, 20 clergymen, 122 merchants, 230 farmers and planters, 18 bankers, 8 bank presidents, 30 editors, 179 authors, etc.

In July 1902 8,619 cadets had entered the Academy, 4,121 had been graduated, 1,945 were living, 1,630 were in the army, 1,446 on the active list and 315 in civil life. The total number of graduates was 4,121. Of these 307 were promoted to the Corps of Engineers, 32 to the Topographical Engineers, 72 to the Ordnance, 49 to the Light Artillery, 1,168 to the Artillery, 1 to the Light Dragoons, 136 to the Dragoons, 648 to the Cavalry, 35 to the Mounted Rifles, 5 to the Mounted Rangers, 1,645 to the Infantry, 5 to the Rifles, 5 to the Marines, and 13 were not commissioned. Two hundred and twenty-four graduates of the Academy have been killed or mortally wounded in action since 1812.

The Academy was housed in the army barracks at West Point till 1815 when Congress appropriated \$20,000 for buildings. Since that time there have been many additions. In 1903 Congress appropriated \$5,500,000 for new buildings and the remodeling of the old according to a comprehensive plan prepared under the direction of Colonel A. L. Mills, the superintendent.

Military Masts, in naval architecture, masts on a modern fighting ship, provided purely for military purposes. They are of steel, and hollow, and through them access is had to the conning tower on the superstructure of the deck where are the wheel, the wires communicating to all parts of the ship, and where the captain generally takes his stand; to the fighting-top with its rapid-fire guns; and to the look-out far above all of these.

Military Police, in the United States army police duty is required of the provost guard; in the British army it consists of mounted and unmounted branches of the regular army service; in France police duty is performed by the gendarmes (q.v.); in Canada, the Northwest mounted police do patrol duty, and there are similar bodies in Australia. In South Africa, the Cape mounted police are available for military duty, and there are similar forces in most of the African colonies.

Military Posts, United States. Upward of 5,000 forts, camps, redoubts, reservations, etc., have been established or erected in the United States since the early colonial period. A great many of these military posts were the result of the Civil War and but few of them have since been maintained. The list of forts, barracks, arsenals, national cemeteries, etc., occupied by troops in 1902, and under control of the War Department, was as follows:

Adams, Fort, R. I.—On Brenton's Point, near Newport.
Alcatraz Island, Fortifications on, Cal.—San Francisco Harbor.

Alexandria National Cemetery, La.—At Pineville.
Alexandria National Cemetery, Va.—At Alexandria.
Allegheny Arsenal, Pa.—At Pittsburg.
Andersonville National Cemetery, Ga.—At Andersonville.
Andrew, Fort, Mass.—At Gurnet Point, near Plymouth.

Andrews, Fort, Mass.—On Peddock's Island.
Angel Island, Fort on, Cal.—Near Fort McDowell.
Annapolis National Cemetery, Md.—At Annapolis.
Antietam National Cemetery, Md.—At Sharpsburg.
Apache, Fort, Ariz.—On White Mountain River.
Arlington National Cemetery, Va.—Opposite Washington, D. C.

Armistead, Fort, Md.—At Hawkin's Point, Patapsco River.
Army and Navy General Hospital, Ark.—At Hot Springs.
Assiniboine, Fort, Mont.—On Beaver Creek, Chouteau County.

 Landing.
 Ship Island, Fort on, Miss.—12 miles from Biloxi.
 Shipp, Battery, N. C.—At Fort Caswell.
 Sill, Fort, Okla.—At Medicine Bluff.
 Skagway, Alaska.—Near Dyce.
 Slocum, Fort, N. Y.—Near New Rochelle.
 Smallwood, Fort, Md.—At Rock Point.
 Smith, Fort, National Cemetery, Ark.—On Arkan-
 sas River.
 Snelling, Fort, Minn.—Near St. Paul.
 Soldiers' Home National Cemetery, D. C.—At Sol-
 diers' Home.
 Southern Branch National Soldiers' Home, Va.—
 Elizabeth City County.
 Springfield Armory, Mass.—At Springfield.
 Springfield National Cemetery, Mo.—At Springfield.
 Standish, Fort, Mass.—On Lowell's Island.
 Stark, Fort, N. H.—Portsmouth Harbor.
 Staunton National Cemetery, Va.—At Staunton.
 Stevens, Fort, Ore.—Mouth of Columbia River.
 Stone River National Cemetery, Tenn.—At Mur-
 freesboro.
 Strong, Fort, Mass.—At Long Island Head.
 Sullivan's Island, Batteries at, S. C.—Charleston
 Harbor.
 Sumter, Fort, S. C.—Charleston Harbor.
 Swift, Battery, N. C.—At Fort Caswell.
 Taylor, Fort, Fla.—At Key West.
 Terry, Fort, N. Y.—On Plumb Island.
 Thomas, Fort, Ky.—3 miles from Newport.
 Thompson Battery, Me.—Portland Harbor.
 Tompkins, Fort, N. Y.—Staten Island.
 Totten, Fort, N. Y.—At Willett's Point.
 Townsend, Fort, Wash.—Near Fort Townsend.
 Travis, Fort, Tex.—At Bolivar Point.
 Trumbull, Fort, Conn.—At New London.
 United States Powder Depot, N. J.—Near Dover.
 Vancouver, Fort or Barracks, Wash.—At Vancouver.
 Vicksburg National Cemetery, Miss.—At Vicksburg.
 Wadsworth, Fort, N. Y.—On Staten Island.
 Walla Walla, Fort, Wash.—At Walla Walla.
 Warren, Fort, Mass.—Boston Harbor.
 Washakie, Fort, Wyo.—On Shoshone Indian Reser-
 vation.
 Washington, Fort, Md.—On Potomac River.
 Watertown Arsenal, Mass.—At Watertown.
 Watervliet Arsenal, N. Y.—At West Troy.
 Wayne, Fort, Mich.—At Detroit.
 Western Branch National Military Home, Kan.—
 Leavenworth County.
 West Point, Military Academy at, N. Y.—West
 Point.
 Wetherill, Fort, R. I.—Narragansett Bay.
 Weymouth, Battery, Me.—Portland Harbor.
 Whipple, Fort or Barracks, Ariz.—At Prescott.
 Williams, Castle, N. Y.—On Governor's Island.
 Williams, Fort, Me.—At Portland Head.
 Wilmington National Cemetery, N. C.—At Winches-
 ter.
 Winchester National Cemetery, Va.
 Winfield Scott, Fort, Cal.—At the Presidio, San
 Francisco.
 Wingrave, Fort, N. Mex.—On the Rio Puerco.
 Winthrop, Theodore, Battery, Mass.—At Grover's
 Cliff.
 Wood, Fort, N. Y.—On Bedloe's Island.
 Woodlawn National Cemetery, N. Y.—At Elmira.
 Wool, Fort, Va.—Near Fort Monroe.
 Worden, Fort, Wash.—Near Port Townsend.
 Worth Battery, Fla.—At Fort Pickens.
 Wright, Fort, Wash.—Near Spokane.
 Wright, H. G., Fort, N. Y.—On Fisher's Island.
 Yates, Fort, N. Dak.—At Standing Rock Indian
 Agency.
 Yellowstone, Fort, Wyo.—In Yellowstone Park.
 Yorktown National Cemetery, Va.—At Yorktown.

Military Prisons, in the United States,
 penitentiaries or prisons set apart for military
 convicts. Long term prisoners are sent usually
 to the military prison at Fort Leavenworth, Kan.,
 or on Alcatraz Island in San Francisco Bay.
 For small offenses prisoners are confined in the
 smaller prisons connected with forts and bar-
 racks. Most of the prisoners in the Depart-
 ment of the East are confined at Governor's
 Island, N. Y.

Military Punishments. See LAW, MILI-
 TARY.

MILITARY RESERVATIONS — MILITARY SCIENCE

Military Reservations, United States, a general term applied to all military posts set aside for military occupation. In most instances large tracts of land surrounding military forts, schools, barracks, etc., are purchased by the government and improved and adorned; buildings, constructed thereon for officers' residences, parade grounds established and works of defense erected. The Presidio reservation in San Francisco is one of the largest in this country. See **MILITARY POSTS, UNITED STATES.**

Military Rule. See **LAW, MILITARY.**

Military Schools, are institutions where soldiers or young men are given a military education. Of the former class, the "soldier schools" of Prussia, established in every regiment or battalion, in which the privates are taught the common rudimentary branches, and sometimes singing also, are the most remarkable. There are similar schools in the Austrian, British, and other European armies. Academies of the second class, intended to educate officers, were not unknown in antiquity, and are now an indispensable part of the military system of all great nations. The first military school in France was established by Louis XV. at Vincennes in 1751; it had 500 pupils, all of whom were young noblemen. The famous school of Saint Cyr was founded by Bonaparte in 1803, and still retains the principal features of its first organization. Even before the Seven Years' war the French had an artillery school in every town where a regiment of that arm was garrisoned. In Germany the education of officers is provided for by high schools for each arm in every army division, and by the royal military school at Berlin, founded by Frederick the Great, to which the most deserving young officers are admitted from the line. In Great Britain the royal military college at Sandhurst, which comprises a cadet's college and a staff college, and the royal military academy at Woolwich, designed as an artillery and engineer school, enjoy a high reputation. A military college was also established by the East India Company at Addiscombe for the education of cadets for their own army. The United States military academy at West Point, founded in 1802, ranks second to no institution of the kind in the world. See **MILITARY ACADEMY, UNITED STATES.**

Military Science, Development of. From a military point of view, the 19th century divides itself naturally into certain well-marked periods. We have first the great era of the Napoleonic wars, closed by the battle of Waterloo. This is followed by long years of peace, broken at last by the Crimean war. The next period to come under notice is that of our own Civil War, in which, in reality, modern conditions of warfare may be said to have taken their rise. The use of independent cavalry, the proper organization of field artillery, the intrenched battlefield, the influence of railways, to say nothing of other particulars now regarded as essential by all military nations, find their first formal expression, if not always their full development, in this great struggle. Recrossing the Atlantic, the next term in the military progress of the century is found in the rise of Prussia, through the defeat of Austria in 1866, as a Power of the first rank, a position confirmed four years later by its complete overthrow of France. Since that epoch, military development, where fostered,

has consisted almost wholly in an imitation, more or less close, of the German system of organization. These last years are marked, moreover, by a hitherto unparalleled application of the arts and sciences to the improvement of the material of war.

It is clear, then, that the growth of the military art during the 19th century has in no wise been a direct function of the time. In some of its most notable aspects the art has developed more rapidly during the past 40 years than it had in the preceding 100. So conspicuously is this true that we may not assert that its state at the opening of the century was even a transition state. In all countries, with the exception of France, the conditions of the 18th had overflowed almost unchanged into the 19th century. The era was that of the great Frederick. His example still bore undisputed sway to such a degree, indeed, that the husk was mistaken for the kernel, the appearance substituted for the reality. The armies of the day were in all essentials hired armies, the soldiers mercenaries, in the sense that war was largely a trade. Organization, recruiting, mobilization, administration, supply, transportation—all these, the life-blood of a modern army, were, if not unknown, at least not understood as they are to-day. They had not as yet been generalized into a continuing system applicable to a state either of peace or of war.

Similarly of arms and of equipment: the flint-lock musket, found in the hands of the troops of all armies, had been for many years substantially a constant quantity, while gunpowder, the only explosive and propelling agent employed, had an unbroken ancestry of centuries of continuous use. The great objective in the training of men, France again possibly excepted, lay in the development of a machine-like precision of drill, and this rigidity was carried so far as to convert maneuvering, even under fire, into a sort of geometrical exercise. On the field, deep columns and serried ranks were the rule. Infantry opened fire at two hundred yards with uncertain, if not innocuous, results at superior ranges. Naturally, under these conditions, cavalry could and did intervene directly in the decision of affairs on the battlefield. The range of field artillery was limited, and, until Napoleon's appearance, its powers and possibilities were not, on the whole, well understood.

The picture changes when we turn to the end of the 19th century. The army is now the "nation in arms"—that is, war is no longer a trade, but a duty, and preparation for war a personal obligation to the state. Upon a declaration of hostilities, at the present day, the effort is made to bring the full strength of the nation to bear, or in other words, mobilization takes place. But this implies a full degree of preparedness, and preparedness, in its turn, a thorough study and application of the principles of organization and training, of supply and administration. Here we touch upon a well-defined characteristic of final as contrasted with initial conditions; preparation for war goes on unceasingly, in times of the profoundest peace, although no possible cause for war can be discerned in any direction. On the material side, the transformation is equally complete. All the possible resources of modern science have been levied on to contribute their share

not only toward the improvement of weapons and of war material in general, but toward supplying the means of placing and maintaining an army in the field. Where 100 years ago but one explosive was known, modern chemical science has supplied hundreds, and the end is not yet. Whereas, in the days of our grandfathers, any respectable foundry could turn out serviceable guns, to-day the gun is the finest product of metallurgical science, and its construction necessarily limited to specialists. Instead of the flintlock, harmless beyond 200 yards, we have the magazine rifle, sighted up to 1,800 yards, and deadly two miles and more away. The muzzle-loading field-piece of limited range and accuracy has given way to the rapid-fire, breech-loading field gun, delivering from 10 to 15 aimed rounds of shrapnel a minute upon a target so distant as to be practically invisible to the naked eye, with an accuracy so great in trained hands that exposure is suicide. Under these conditions the masses of elder days have dissolved into thin lines of invisible skirmishers, and cavalry has all but disappeared from the field of actual conflict. In general, armies have increased vastly in size, and the important battles of the future will probably last for days.

In war, as in everything else, the secret of success lies in organization and preparation. It is interesting, then, to note how two separate and apparently independent conditions have been combined in the evolution of the modern army. The first of these in time, and, with reference to actual combat, in importance, is the creation of the army corps by Napoleon in 1805. What a long step forward this was may be inferred from the fact that Frederick the Great's army was not formed into even brigades and divisions. Besides assuring unity of command, the creation of this strategic unit has led in modern times to the full recognition and definition of the "tactics of the three arms." All modern armies, therefore, whether they belong to military or to unmilitary nations, on taking the field are formed into corps, and these corps are maintained as organic units in times of peace by the great military nations of the world for administrative as well as for purely military reasons.

Hardly less important as leading to a principle of organization was the limitation imposed by Napoleon after Jena upon the size of the Prussian army. This was never to exceed 42,000 men, and, in fact, it never did; that is, at no time while the limitation was in force did Prussia keep more than that number of men under arms. But, thanks to Von Scharnhorst's foresight and intelligence, the members of this army were continually changing. As fast as trained, they were liberated to make room for new and untrained men. With the immediate results of this idea we are not here concerned: what we wish to bring out clearly is that this plan of organization, originally local in both time and circumstances, is to-day fundamental in the formation of the armies of all military states. Indeed, these, if the paradox were permissible, may be said not to have a regular army at all. Great Britain has one, as have the United States, but in all other important nations the condition of universal military service has made the distinction superfluous, if not meaningless, by wiping out one of its terms. Hence, with the exceptions noted, a mold exists, so to say

a form, through which all citizens capable of bearing arms have to pass. From this comes the dictum, "The army is to-day the nation in arms," as distinguished from the purely professional army of the earlier part of the century. The application of the principle of universal service has resulted naturally in a classification of the male population with respect to service. Thus we find in Germany the active army made up of the men with the colors, the reserve of the active army, the Landwehr, and the Landsturm (q.v.). Classes more or less similar exist in other countries under different names, the underlying principle being, however, substantially the same in all. This principle further leads directly to the distinction between peace footing and war footing, passage from the one to the other being effected by mobilization, an operation unknown at the opening of the century. Since, moreover, the whole nation is the army, it results that the modern army has greatly increased in size, a result that would prove embarrassing but for the existence of the staff. It is clear that the formation, instruction, training, supply, and administration of this army form a task of the greatest magnitude. Furthermore, when once formed, if it be not intelligently led and accurately directed upon its objective, it runs the risk, from its mere size, of degenerating into an armed mob. Hence the conditions leading to the formation of the modern army have led, *pari passu*, to the formation of the modern staff. This simply means that by a natural evolution the functions of the staff have expanded until they now include duties not formerly contemplated. Thus the conception of a general staff, whose special business it is during times of peace to study and prepare for any campaign whatever on any theatre of war whatever, is distinctively modern. The existence of such an organization is evidently a necessity due partly at least to the great size of modern armies. This very condition, by increasing the difficulties involved, has suggested the only cure of these difficulties—a body of specialists trained to weigh them in peace and to remove them in war. And so of the administrative staff under the same conditions: the supply of an army, taking that term in its most comprehensive sense, is reduced to a continuously operating system. Obviously this particular question could not be left to chance for its answer.

The limits of this article forbid more than a mere mention of the influence of the railway and of the telegraph. Without these, rapid concentration and regular supply would be impossible, a matter of capital importance in view of the great numbers enrolled. It would be hazardous to assert that the railway has been a prime factor in determining these numbers, but there can be no doubt that it has wielded a great influence in this direction. Other things being equal, it is logical and proper to have a large army, because the means of transporting and of supplying a large army are at hand. We are speaking here of railways in a strategic sense.

The art of war is usually defined to consist of two elements, strategy and tactics. Of these, the former is essentially immutable, its principles, few and simple, having remained unchanged throughout the whole course of history. The only recent development in strategy is one, therefore, affecting not its principles, but the

MILITARY SCIENCE

means of applying those principles. The employment of the railway and of the telegraph has greatly increased the rapidity with which strategic combinations may now be carried out, and has added to the number possible within a given time and area. In general, then, strategy is not a measure of the changes occurring between any two given epochs, while tactics, on the contrary, responding sooner or later, if not instantaneously, to any new influence, does furnish such a measure. We shall here briefly consider the tactics of infantry from this point of view, because this arm is still the "queen of battles," and the others have to conform to its possibilities.

To clear the way, let us recollect that the tactics of infantry had remained substantially unchanged from the days of Gustavus Adolphus to those of Frederick the Great; that the latter, by the use of lines in place of columns as a habitual formation, had increased the mobility, and, by the substitution of an iron for a wooden ramrod, the rate of fire, of his troops. As, however, the range of the musket was extremely limited, fire was opened at very short distance, and, independently of any system of tactics, the bayonet was, therefore, a weapon of great importance. Indeed, it might happen on a rainy day that the bayonet was the only weapon available. As was but natural, Frederick's system, known as the "linear" system of tactics, was copied by all other armies.

With the French Revolution came a change. Unquestionably inspired by our own Revolution, in which, for the first time, skirmishers appeared on the field of battle, the French, abandoning the precise linear system, substituted therefor small columns for maneuver and assault, and deployed lines for firing. In maneuvering, skirmishers covered the front, unmasking it as each company arrived on the firing-line. We note at once that this employment of skirmishers is not the modern use, but, nevertheless, it marks the breaking of tradition. The French system, known as the perpendicular, was followed in all Napoleon's earlier campaigns. In 1805, he prescribed that the normal formation of the division should be by "linked brigades," a disposition carrying with it the advantage of giving each brigade a separate objective. This principle is to-day fundamental in combat-tactics, even the company having its designated objective.

Frederick's system, decisively beaten at Austerlitz, was finally overthrown at Jena-Auerstädt, and, in 1813, the tactics of the French, including the use of skirmishers, became universal. But before this the English had adopted a two-rank formation, and had successfully opposed thin lines to the heavy columns which the French, for reasons into which we need not here enter, had apparently found themselves compelled to re-adopt in the Peninsula. In fact, the type-formation was not as yet firmly fixed, the English using heavy columns at New Orleans, and the French, in spite of their experience in Champagne, resuming them with disastrous results at Waterloo.

All the changes here touched upon, it will be noticed, are independent of any change or improvement in weapons, and are simply efforts in the direction of increased mobility and flexibility. Passing by the Crimean war in which, apparently, the experience of the past had been totally forgotten by both sides, we reach our

own Civil War, "remarkable as a turning-point of tactics, there being scarcely a feature of the tactics of the present day that did not have its germ, its prototype, or its development in that great contest." Both armies were now armed with the rifle, the extreme range being one thousand yards, and in the Union army the breech-loader made its appearance before the end of the war. Marksmanship was of a high order on both sides, and infantry fire consequently so deadly as to effect marked changes in tactical formations. These are, briefly, attacks by rushes, attacks in successive deployed lines, the use of heavy lines of skirmishers in place of the old line of battle, and the use of hasty intrenchments. They were brought about by the common sense of the American soldier, who, unhampered by tradition, knew how boldly to adapt his tactics to the confronting situation. The only further comment necessary is that these changes now constitute the normal order in all civilized warfare.

Europe, however, was slow in learning the lessons of our war. In 1866, the Prussians, using the breech-loader against the Austrian muzzle-loader, generally attacked in company columns, preceded by skirmishers, who were ordered to feel and develop the enemy, and not, as at present, to begin and carry on the combat from beginning to end. But the Prussian privates instinctively left their columns to join the skirmishers, with the result familiar to all. Strange as it may seem, the Prussian authorities failed to appreciate the new conditions of warfare, for, deprecating "the disorder and tumult of the impromptu attack-formation, which had sprung into being under the Austrian fire, . . . they waited for the appalling losses of a greater war to emphasize the necessity of a change in their prescribed tactical methods." This experience came in 1870. Both combatants were now armed with the breech-loading rifle, the Chassepot being effective at 1,300 yards. Before the end of the war, under the superior musketry fire of the French, the Germans found themselves compelled to deploy their columns, the direct attack being made, and the hostile position invariably carried, by the rushes of swarms of skirmishers. All the nations of Europe now hastened to bring their tactical systems into agreement with the experiences of the Franco-Prussian war. But it took still another war to drive home the conclusions reached by us in 1861-5. The Turks, in 1877-8, armed with the Peabody-Martini rifle, a weapon vastly superior to any heretofore used, by their use of the American system of hasty intrenchments compelled the Russians finally to deliver their assaults in successive lines of deployed battalions.

This very brief outline shows us that the revolution wrought in infantry tactics during the last half-century has been due almost wholly to the improvements in the rifle. The most recent of these, namely, the introduction of rapid fire through the use of a magazine, will simply carry on the development along the lines already laid down, while the advent of smokeless powder has increased the powers of the defense. All the conditions of the modern combat, therefore, combine to make the frontal attack the exception, flank attack the rule, a principle which is characteristic of modern tactical methods.

But progress has been marked in other

MILITARY SCIENCE

directions as well. We may remark the importance of "combined tactics," or "tactics of the three arms." This, of course, is not a new idea; it has simply received fuller expression through a more stringent application of the principle of division of labor, growing out of the universal recognition of the corps as a strategic unit. As this is really a complete army in itself, though on a small scale, so its full effect can be felt only in case all the arms composing it act in concert to secure the common end. Hence, the powers of the three arms are, perhaps, more accurately measured, their relations to one another better adjusted. The new role of cavalry, too, deserves notice. If it has lost its former weight on the actual battlefield through the power of both infantry and artillery fire, it has gained in consequence of its employment in independent masses. Operating far in advance of the army, it is the purpose of these masses to cover its concentration and to screen its movements, while seeking at the same time to prevent the formation of the hostile forces, and in any case to discover their emplacements, numbers, and objective.

In other ways, too, it has gained. The dismounted fire-action of this arm—that is, its action on foot as in infantry—is now recognized, the alternative being helplessness on the tactical defensive. So highly have we developed this mode of using cavalry in our own country, that many foreign writers have asserted that our cavalry is only mounted infantry. Our answer is that all European mounted troops are either reluctantly or unconsciously conforming to the type of the American cavalryman of 1864-5, without abating one jot or tittle of their right to be, and to be called, cavalry. In England chiefly, a solution has been sought in the creation of mounted infantry. The idea here is that the horse shall serve purely as a means of rapid transportation, his rider dismounting on reaching the scene of action. No better example can be found than that furnished by the British themselves in South Africa, in their attempts to cope with the mobility of the Boers. The reader will recognize at once in the mounted infantry a reversion to the original type of dragoon.

We may fitly conclude this part of the discussion by drawing attention to the increased responsibilities devolved by modern conditions of warfare on the private in the ranks. He has ceased to be considered a machine, mere food for powder, a molecule of the mass whose shock is to crush the adversary. On the contrary, as many occasions will surely arise calling for the exercise of sound judgment, so is he expected to be an intelligent element of the national defense, his value to his country bearing a direct ratio to the degree to which his intelligence can be awakened and trained.

No survey of the military century would be adequate without some reference to the immense development given by the mechanical spirit of the age to the enginery of war. Of course, the impulse in question is not purely military; it is simply the application to war of a principle pervading every other phase of life. In general, every invention that might possibly increase the economy, certainty, or rapidity of a displacement, whether of men, of material, or of projectiles, has been summoned to give its share of improvement. All inventions bearing on the transmission or acquisition of intelligence have

been pressed into service. One of the latter—the balloon—antedates the century, but the idea of photographing the enemy's position from its car is new. So is the application of wireless telegraphy to purposes of communication in the field; this invention is turned to a military end almost before it has definitely left the inventor's hands.

The greatest advance, however, has been in the perfection of man-killing machinery. Upon this one subject have been expended all the resources of modern metallurgical and chemical skill until the projectile weapon of the day, whether gun or small-arm, is a marvel of strength, accuracy, and convenience. From the rude tube of our forefathers we have passed to engines of complicated structure, deadly beyond the limits of unaided vision, and of a rapidity of fire undreamed of even thirty years ago. So great is the volume of fire, so destructive the shrapnel, that in field artillery duels the question of success is reduced to that of being the first to get the range. Each class of guns must now have its special propelling agent, and a serious effort is making to discover some means of launching in safety the frightfully destructive explosives due to modern chemical research.

Side by side with this sort of development has marched that of the art of protection. But here, in contrast with the increasing complexity of the means of offense, we remark the increasing simplicity of the means of defense. At the dawn of the century, the genius of Vauban still prescribed the bastion system for any and all sites to be fortified. Just as in the field, rigid and pedantic notions governed all troop-evolutions, so in fortification the prevailing idea in each case was to furnish a rigid geometrical solution. To-day the idea is first of all to adapt the work to the site, independently of the type. Steel turrets, cupolas, armored casemates, are provided for specially exposed points—a solution made possible by the great general advance in metallurgy. Concrete has displaced masonry, and the face presented to the enemy is always either of earth or, where that is impossible, of steel.

Upon the general question of fortifications, authorities are divided into two camps. Those of the first assert that fortresses cover a mobilization, retard the enemy, allow a defeated army to reft under shelter. Their opponents, on the other hand, maintain that they tie down an army, reduce the numbers of the field armies; that forts will be covered and not reduced; that they will not keep out a superior, and are useless against an inferior enemy; and that a government cannot afford to man them, if the antagonists are otherwise evenly matched. The question will probably always remain open. In the meantime, the frontiers of Europe bristle with forts, and every important capital is the centre of a vast intrenched camp. The great contribution of the century to the question of fortification is not so much one relating to the type, though this is marked, as one relating to the occasion. From hasty or improvised intrenchments these latter days have seen the evolution to such defenses as those of Petersburg and of Plevna, erected not with the deliberation of peace, but under the stress of war, to meet its exigencies as they arise. See FORTIFICATION.

MILITARY SERVICE INSTITUTION—MILITARY ZONES

The conditions now laid down mark the character of modern warfare. As the whole energy of a nation—a constant quantity in each case—is sought to be put forth in the shortest possible time, so the period during which this energy is expended is reduced. We may therefore confidently expect that wars between civilized nations, when carried on by the regularly organized forces, will be short. Naturally no limits can be assigned, for these will vary in each particular case, not only with the military factors involved, but also with others, such as the character of the people and the policy of the combatants, to which no arbitrary value can be assigned. We may feel reasonably sure, however, that the great and increasing complexity of modern life, involving international contacts at an ever-increasing number of points, will combine with the military conditions hereinbefore outlined to reduce the duration of war to the utmost. Whether it will put a stop to war, no one can tell. But it should not be forgotten that this very complexity, in these days of "expansion," may itself prove a fruitful source of conflict. In other words, wars of dynasty, wars to maintain the balance of power, are obsolete; should an armed struggle break out in the future, it will probably owe its origin, as it will certainly owe its strength, to the people. See **MILITARY ZONES**.

C. DE W. WILLCOX,
Captain, Artillery Corps, U. S. Army.

Military Service Institution of the United States, a society of officers of the United States Regular Army, organized in 1878 by Generals Fry, Stanley, Rodenbaugh, Colonel Lieber and others. It was designed as a similar organization to the Royal United Service Institution of Great Britain. The presidents of the American Society have been Generals Hancock, Schofield, Miles and Ruger. The headquarters are at Governor's Island, N. Y., where the Institution has acquired a library of 20,000 volumes including many rare documents. The society issues 'The Journal of the Military Service Institution.'

Military Telegraph, commonly applied to the use of telegraph wires in warfare as in the Civil War when a corps of engineers constructed temporary telegraph lines from the front to points in the rear of an army. In later years this system has been superseded by the heliograph (q.v.) and still later by wireless telegraphy and the use of flag signals commonly known as wigwagging (q.v.).

Military Tenure. See **TENURE**.

Military Transport Service. See **ARMY TRANSPORT SERVICE**.

Military Tribunals. See **LAW, MILITARY**.

Military Zones are geographical belts of territory which dominate all wars that have large and diversified areas of operation—and these are as well defined as are the right, centre, and left of corresponding divisions, corps, or armies of each contending command. Baron Jomini credits the chief successes of the first Bonaparte to his skill as well as celerity in the occupation of river and mountain boundaries or positions, as three sides of a quadrilateral, of which the centre is the natural base, the fourth side being that occupied by the adversary. All

campaigns and field operations may partake of these elements of success when strategic conditions evolve their value. The subject-matter under notice has a larger and more generic relation to the broadest possible field of military activity.

During the American Civil War of 1861-5 more territory was traversed, and more combatants engaged in the struggle than in any other of historic record. The entire central and southern portion, from east to west, constituted the theatre of war, and must be thus regarded in considering the main events which culminated in the Union restored. The right zone for the Federal armies was that of the Trans-Mississippi region, while at the same time indicating the Confederate left. Control of the Mississippi River by either was equivalent to that of an impassable mountain chain. The Federal left, and the corresponding Confederate right, were indicated from the Blue Ridge southward, as far as the Savannah River. The centre zone for each army, meaning the entire military force of each, reached the lower Atlantic coast and the Gulf of Mexico. Irrespective of operations by water, the base of the Federal armies, as well as the objective of Confederate operations, was the region immediately north of the Ohio and Potomac rivers. The Confederates sought only to control Southern territory, proper, while the Federal armies were compelled to restore the entire South to the control of the national government.

The initiative taken in 1861 was a partial surprise to the greater and more populous section; but the year 1862 introduced a contest more truly scientific, and yet one where the smaller numbers carried on operations with marked ability upon almost equal terms with the larger force. The accompanying map illustrates all principal operations, their relations to each other, and to the final result. That part of the central zone styled "Semi-Neutral" has special significance, as it controlled a position more vital to general success than any portion of the famous Austrian Quadrilateral of Napoleon's great Italian campaign, or his operations on the Rhone, toward the North Sea. Within its determining range and area, the city of Louisville and its feeders of supply became a factor of almost supreme control. The Kanawha River on the east, with the Tennessee River on the south and west, bounded this tract of country, while the railroad from Richmond, Va., via Lynchburg, Cleveland, Chattanooga, Decatur and Corinth, running behind the Cumberland Mountains, represented an interior line of speedy transit, which greatly aided the concentration of Confederate armies. Their troops fought alternately near Richmond and at the west, while the transfer of two Federal corps from the Potomac to the Tennessee required a detour through Columbus, Ohio, and even through Indianapolis, Ind., because of low water in the Ohio River at a most critical juncture. Federal preparations for that campaign were stupendous. In the Left zone, on 12 January, Burnside with four brigades, gunboats and transports, sailed from Fortress Monroe with sealed orders, attacked Roanoke Island, 8 February, occupied Chowan on the 20th, Washington on the Pamlico River, on the 21st, and Morehead, the same day. In the Middle zone, Thomas was successful at Mill Spring, Ky., 19 January. On 5 February, Admiral Foote

MILITARY ZONES

captured Fort Henry. Buell pressed forward to Bowling Green, and occupied Nashville as soon as Grant captured Fort Donaldson. Columbus, Ky., New Madrid and Island No. 10 soon yielded to Federal control, and the Mississippi River was practically within Federal influence. In the Right zone, Springfield, Mo., was occupied by Curtis, and Price retired to Arkansas. On 7 February, Romney, W. Va., had been occupied by Federal troops, and by 1 April, Charleston, Martinsburg, Leesburg, Winchester, Berryville, Sharpsburg and Woodstock had also been taken. The 8th of March witnessed the wonderful episode of the fight between the Merrimac and the Monitor; and by 1 April the Army of the Potomac, 100,000 strong, was before Yorktown. Meanwhile, Port Royal, S. C., Jacksonville and Pensacola, Fla., had been reached by sea, threatening the Confederate base of supply behind the advanced battle-front. Such, briefly, was the Federal initiative of the campaign of 1862, and Grant had reached Pittsburg Landing on the Tennessee River.

But the Confederate forces were neither idle nor disheartened. General A. S. Johnson proposed to unite the armies of Beauregard, Polk, and Bragg, and strike Grant before Buell could reinforce him from Nashville. Bad weather and other unanticipated events lost three marching days to the advancing Federal armies, so that the surprise and partial rout of Grant's command on 6 April was not fully relieved from danger until Buell's corps brought timely and adequate support that evening. Beauregard fortified Corinth, upon succeeding to command after the death of Johnson, and on 30 April retired in good order from overwhelming Federal forces under Halleck, who succeeded Grant, but did not follow up pursuit. At this time, the military approach to Yorktown, in the Federal Left zone, had been advanced, ready for assault; when, as at Corinth, the Confederate commander abandoned a defenseless position, preserving his force intact, with no loss of prestige or credit. Federal movements on the Chickahominy, with the battles of Fair Oaks, Gaines' Mill and Malvern Hill, brought the army of McClellan to Harrison's Landing, only to be summoned at once to Washington, there to be confronted by the same Confederate divisions which had faced them before Richmond. Stevens was recalled from Port Royal and Burnside from North Carolina. The Confederates had taken the offensive, and forced the Federal troops back upon their original base. A call for 300,000 volunteers and 300,000 drafted men followed. On 15 September, Harper's Ferry was surrendered with 12,000 men. On the 18th, followed the battle of Antietam; and yet, when the army, largely reinforced, sought to renew the fight, it was found, as at Corinth and at Yorktown, that the smaller force had withdrawn from an unequal contest. On 12 November, the Federal army forced the Rappahannock, but was repulsed with heavy loss; and Washington, the Federal capital, was again on the defensive. At the West, equal contrasts marked the issues of the year. On 20 August, Kirby Smith invaded Kentucky, together with Bragg, routed Nelson's army at Richmond, Ky., and seriously threatened both Cincinnati and Louisville. On 19 September, Bragg captured Munfordsville, compelling Buell to return from Nashville to save Louisville from capture and Indiana from invasion. All

public stores were removed to the Indiana shore, and heavy batteries were established to prevent the crossing of the Ohio River in case Buell should not arrive to resist the advance of Bragg. Still farther westward, on 2 December, Grant advanced toward Holly Springs and engaged the enemy, but they withdrew in good order. General Sherman attempted the capture of Vicksburg, and upon an error in report of its capture a salute of 100 guns was fired at midnight at Indianapolis, Ind., but the siege had been raised. On 6 December, Bragg moved from Murfreesboro and captured a Federal brigade. In the Right zone, General Hindman, Confederate, was defeated, practically ending operations in that zone, as those of 8 March, at Pea Ridge, had secured to the Federals a similar success. The close of this eventful year witnessed the memorable battle of Stone River; but for the fifth time the Confederate army was skilfully rescued from the pressure of a superior force, and one within fighting distance.

A brief review is suggestive. Curtis and Pope in Missouri, Grant and Buell in Kentucky, Banks at Winchester, Butler planning the expedition to New Orleans, represented no less than ten armies and as many lines of operation, against each of which the Confederates, from their advantageous positions could, just then, concentrate a superior force. The cry: "On to Richmond" as a prime objective, rather than the destruction of armies in the field, frustrated all the grand plans with which the campaign in the Left zone had opened. In the centre, with the Ohio River as a base, and the semi-neutral zone exposed on three of its faces, there was a division of force that rendered the superior numbers of Federal divisions powerless for determining results. Pope along the Mississippi, Grant along the Tennessee, Buell along the Louisville and Nashville railroad, and another force at Cumberland Gap, represented the miserable features of the campaign. Too much ground was covered. The obvious reason for this was the necessity of protecting citizens who in this region were between two fires of differing political bias. Cities were preserved instead of crushing armies in the field. Bonaparte fought at Austerlitz and Wagram rather than be cooped up in Vienna, and Washington more than once neglected Philadelphia to keep his army fresh for the field. It is at least certain, however, that the campaign of 1862 demonstrated the military ability of the Confederate commanders.

It was one of the most trying hours of President Lincoln's life, when, on 9 July 1862, having ordered Generals Halleck and Pope to report to him, in person, he reached the conclusion that some new man must be found, who could control all Federal forces in the three zones, and through universal supervision, realize universal success. The Cabinet was divided. Chase, Seward, and Wells held a conference at the house of Senator Sprague of Rhode Island, William Cullen Bryant being also invited, but not Mr. Stanton; and Mr. Chase declared that "he would surrender the Portfolio of the Treasury before night, unless McClellan were removed." The writer, a guest at the house, was requested to meet Generals Halleck and Pope at the train, and advise them that they "were expected to accompany the Cabinet from Willard's Hotel to meet President Lincoln, at the Soldiers' Home at ten o'clock in the morning." This was

MILITIA

done. Halleck succeeded McClellan, but the ultimate disappointment was as colossal as was the work to be done.

The campaign of 1862 closed as gloomily for the Federal arms as its opening had been propitious. But its 12 months of vicissitude, rarely, if ever surpassed in human history, had demonstrated that a people who could survive such an ordeal, once reunited, would be invincible against the world. Mistakes were merged in the result. The bad strategy of 1862 yielded to the enormous force which was rallied to meet the sovereign issue, and end the war. In all zones, the pressure began to harmonize and work together. Hood's offensive return in the Middle zone, after the fall of Atlanta, and his defeats by Schofield and Thomas at Franklin and Nashville, ended organized resistance in that zone. When, in addition to control of the sea, Sherman gained the rear of all resisting forces, there was no adequate barrier against Federal success.

For details of the successive acquisitions of territory thereby regained for the Federal Union, see CIVIL WAR IN AMERICA.

HENRY B. CARRINGTON,
United States Army.

Militia. When the Constitution of the United States was adopted, the term militia was understood to have a definite meaning. By that instrument Congress obtained power "to provide for organizing, arming and disciplining the militia, and for governing such part of them as may be employed in the service of the United States. . . ." The Constitution also created the President "Commander-in-Chief of the Army and Navy of the United States, and of the militia of the several States when called into the actual service of the United States." The Articles of Confederation had provided, "that every State shall always keep up a well regulated and disciplined militia, sufficiently armed and accoutered, etc." When the colonies united against the mother country they joined their quotas of volunteers from the militia, and with them fought the battles of the Revolution, and eighty years later the great Civil War was fought by the militia, using that term in the sense which the government had adopted. By the Act of Congress passed in 1792, the first exercise of its power, the militia was defined to be all male citizens of the United States between the ages of 18 and 45 years, excepting certain specified exemptions. The term thus used by our original lawmakers, with apparent positiveness as to its meaning and as to a conception of its function, has, of course, an interesting history which in brief follows:

English Militia.—As early as the time of Alfred the Great, the division and organization of society in England comprised the enrolment of the people in bands or companies, commanded by a leader, who was elected in the folk-motes, and called ealdorman or earl, and whose authority extended over the county. "By the Anglo-Saxon laws, or rather by one of the primary and indispensable conditions of political society, every freeholder, if not every free man, was bound to defend his country against hostile invasion." Every ten families, as far as convenient those related to each other, formed a tithing, commanded by the "borsholder" in his military capacity, ten tithings formed a hundred, several

of these forming a trything, or riding, as the word has been perpetuated in Yorkshire. Three public burdens, the *trinoda necessitas*, were imposed upon the citizen, to serve under arms, to repair and construct fortresses, and to make and repair roads and bridges. The Norman Conquest was the means of creating an army made up of bands which attended the king under the command of their immediate lords by "knight service," but that in no way changed the fundamental character of the militia. It was enacted by Henry II. with the consent of Parliament, that every freeman, according to the value of his estate or movables, should hold himself constantly furnished with suitable arms and equipments, the poorest having to provide himself with a "wambais" or linen coat stuffed with cotton, and a lance. In the time of Edward I. the Statute of Winchester defined these requirements more clearly. "Every man between the ages of 15 and 60 was assessed and sworn to keep armour according to the value of his lands and goods; for 15 pounds and upwards in rent or 40 marks in goods, a hauberk, an iron breastplate, a sword, a knife and a horse. For smaller property less expensive arms. And these provisions were enforced by semi-annual inspections by constables chosen in every 100." From the earliest times the High Constable of the County or Sheriff was the officer by whose authority the citizens were called out, either to drive off predatory hands of robbers, or to assist him when he was in the performance of any duty required by the courts of law. When thus called out for the latter purpose, the body was known as the *posse comitatus*, or power of the county, and to this day the same power is lodged in our office of sheriff and is the ultimate resort of the county officer charged with legal process. The constitutional military force of the kingdom consisted, therefore, of the feudal troops and the *posse comitatus*. But the latter could not be marched out of the kingdom, nor yet out of their shire, except in case of invasion. The sheriff was also charged with the same duty of calling out the militia when the citizens were organized in pursuance of parliamentary enactments, but later when the kings considered themselves to be in need of troops more under their immediate control, he was superseded by Commissioners of Array, although his authority remained unaltered as to summoning assistance for local duties. Prior to the reign of Elizabeth, Lords Lieutenant in the several counties were appointed by the Crown to marshal the militia forces. The people were always exceedingly jealous of their rights, and as a nation insisted more upon pursuing their home labors than upon conquests and achieving glory, and one of the earliest records of this spirit is the enactment in the time of Edward III. made as a restraint upon the infractions of the rights of the people, that no man shall be obliged to equip himself except as has been the custom, and shall not be obliged to leave his shire except when necessity require it for the defense of the realm. Conscriptions and levies were resorted to at times, but were tolerated by the people only when their love for the government exceeded the bounds of resistance or revolution. The civil war of 1642, the result of which was the execution of Charles I., was precipitated and protracted in part by the militia question. The right of the king, as chief executive of the na-

MILITIA

tion, to call the militia into service in time of need, was undoubted, but through the natural jealousy and distrust of Parliament, the power of the king was sought to be curtailed by making the office of Lord Lieutenant irrevocable for two years and giving those offices to the persons approved by Parliament. For six years this was one of the main topics of contention in the wars and negotiations which resulted in the establishment of the commonwealth. The result of the war was to put England under the subjection of Cromwell and his army, and ultimately to fill the people with a great detestation of a permanent military establishment, and the whole course of subsequent legislation upon soldiery was directed with care to avoid the dangers of a standing army. The restoration of 1660 was finally accomplished through the militia of England. To epitomize Macaulay's statement:—It was an exciting time, the flame of civil war was actually rekindled, the nobility put forth their best energies to assemble and train the militia, and train bands were held ready to march in every county. The popular feeling and strength were too great to be disregarded, the old army of 50,000 men was humored as well as intimidated into accepting the unmistakable desire of the nation, and it saw itself destroyed without striking a blow, looking sullenly on the triumphal entry of Charles II. into London, while the militia invested the country with a strength they dared not measure. A force of upward of 120,000 men had been organized to act in this great emergency.

Shortly after the restoration, the Parliament, filled with the idea of how important as well as how trustworthy the militia was, passed a bill organizing it. A horseman was required to be provided, equipped and paid for by every one having an income of £500 a year derived from lands or £6,000 of personal property. And every one whose income or possession was one tenth of those amounts was charged with the equipment and pay of a pikeman or musketeer, and those of less estate were obliged to combine in furnishing horse or foot soldiers. The size of the body of soldiery thus created was estimated at 130,000 men. Regular times for drilling the train bands were appointed, not to exceed 14 days in the year, and the men were not paid by the crown except when called into actual service. For a time, this force became and was a useful and serviceable body, but the influence of the Crown was not lent to perfecting it. The king's desires were rather to obtain possession of an army that could be used to do his bidding however unpopular the acts required might be. James II. was met by the jealousy of Parliament just as Charles I. had been, and it proved for him no less an obstacle. Of a religion that was hated by the mass of the people, and repeatedly thrusting men who were mere tools of the Crown into office, James II. awakened a sense of distrust and opposition; his attempts to raise a regular army, by demands for the necessary appropriations from Parliament, were the occasions of debate upon what the military establishment of the country was and should be. These arguments were renewed pro and contra on different occasions, but the king saw his wishes disregarded when, at the very height of his power, the dangers of a standing army were emphasized by Parliament and a bill to make the militia more efficient was passed at the same time that sup-

plies for the army were granted. The popular feeling was embodied in what was said in Parliament at this time in answer to what the courtiers had to urge in favor of regular troops. Sir Edward Seymour, Sir William Twisden, Sir Richard Temple, and Sir John Maynard, the most learned lawyer of his time, gave vent to these utterances. Said the first of these: The militia might not be in a satisfactory state, but it might be remodeled, and he would rather give a million to keep up a force from which he had nothing to fear than half a million to keep up a force of which he must ever be afraid. The troops enrolled in the regular service, however, continued to increase in number, made necessary through the foreign relations of the English government, but the people accepted the increase reluctantly, always holding fast to the idea of a militia as their real protector. The force of circumstances, when the House of Orange was called to the throne, changed to an extent the feeling of the country in this regard, and danger from foreign foes made soldiers a necessity which the people reluctantly recognized, and without such fear for their domestic content as they had before entertained. The sentiment of the country was again shown when the House of Hanover came to the throne of England, although at this time the regular army had become a permanency, having been continuously provided for on the theory that a standing army was a necessity "for better preserving the balance of power in Europe." In 1757 the militia of England was again reorganized, the impelling motive being that which had always been uppermost in the minds of Englishmen, namely, to take away the pretext for a standing army, and a quota was fixed for each county. The provisions were for five years' service, the position of an officer was made important by proper qualifications, and it was provided that without the exigency of service the companies should not be marched out of their own counties. It was believed that although under the authority of the Crown, the possession of the offices by gentlemen of estates would always insure the services of the militia to the good of the people. This force gradually became, by reason of the limited size, the right given to furnish substitutes, and a progressive necessity to supply pay, clothing, and all other expenses, a feeder for the regular establishment, a distinct species of reserve, and in consequence the free, patriotic and military spirit of the country began to manifest itself by the creation of volunteer organizations. Prior to that time the "militia had enjoyed for many years as compared with the regular forces, a social, as well as a constitutional superiority." The volunteers now replaced, to an extent, that ancient power. The control of the militia of Great Britain was eventually taken from the county and lodged in the Crown in 1871, and since then the militia has been a part of the regular force. One significant fact may be cited from the reports of 1880, out of 92,677 men of the militia, only 585 were six feet, or over, in height. The volunteers were said to represent the national instinct for defense; Lord Brougham called them a National Insurance; General M'Murdo said they were a great training school of citizen soldiers. The laws of England for many years did not allow Roman Catholics or dissenters to serve in the militia, and a serious contest was made by Wilberforce in 1797 to pass

MILITIA

a bill removing the disability, but in vain, nor was it until 1817 that the service was opened to them.

The foregoing brief reference to the militia of Great Britain is of greater interest than an account of the militia of Greece, of Switzerland, of South Africa, or of any other country, because it is the foundation of our own militarism. In all free or republican countries, the embodiment of the military spirit is shown by the popular ability to bear arms and to organize for war. The transition of nations from a condition of popular military education, discipline and strength, to military powers, possessing large armies, devoted to war for defense or conquest, is a theme beyond the limits of this article.

American Militia.—The peculiar life of the colonies in America rendered it necessary that the colonists should keep themselves armed and experienced in the use of weapons of defense, inheriting the institutions of the mother country, the existence of a militia was an assumed matter in their organization. The adoption of the Constitution of the United States, above quoted, in 1789 was the subject of innumerable debates and political views and prophecies, and the proceedings of the constitutional conventions concerning the adoption of the clauses relating to the militia are most interesting as a matter of political history; space, however, will not permit an account of them. Singularly enough, South Carolina and Virginia were on the side of giving the government greater power, while Massachusetts and Connecticut were opposed to curtailing the State control. Propositions were successively voted down in attempts to frame the Constitution in this regard among others as follows:

(a) To make laws regulating and disciplining the militia, not exceeding one tenth part in any one year.

(b) To establish a uniform and general system of discipline for the Militia of the States, and to make laws for arming and disciplining and governing such part of them as may be employed in the service of the United States.

(c) To establish a uniformity of arms, exercise and organization for the militia, and to provide for the government of them when called into the service of the United States.

(d) To add to the clause reserving to the States respectively the appointment of the officers, the words "under the rank of General Officers."

We have to bear in mind that the majority tried in many instances to yield the very minimum to the general government of the powers deemed essential to that government, and this fact explains the fragmentary character of the provisions as to the militia. But the conviction was general that the militia must be trained with uniformity, and be so organized as to become a defense to the nation, and that the only authority to provide therefor was the general government. Hamilton in the 'Federalist' fully defended the Constitutional plan. Patrick Henry in Virginia was convinced that ruin would follow the adoption of the law. So much concern was felt regarding the militia that among the ten amendments which were promptly made, and declared to be in force 15 Dec. 1791 was that (No. 2), providing "a well regulated militia being necessary to the security of a free State, the right of the people to keep and bear arms shall not be infringed." The State Constitutions and the State laws have from time to time, and invariably, dealt with the militia of the respective States, and are held by the courts to be controlling, so far as not inconsistent with the Fed-

eral laws, but they have not been uniform as to service, duty or organization. They have generally provided for organizing those who wished to volunteer, and the respective Governors of States are Commanders-in-Chief of their militia. It has been demonstrated by time that Congress by the Act of 1792 made an ineffective law, by prescribing uniform duties for the entire male population composing the militia, and though thereafter for over one hundred years the law was retained with slight amendment upon the statute book, it was not enforced and was the subject of repeated efforts at modification. The Presidents of the United States, notably Washington, Jefferson, Madison, Adams, Jackson and Van Buren, in their messages to Congress, urged further legislation to create an efficient militia. Elaborate reports were made from committees in Congress, but nothing was accomplished except that in 1808 an annual appropriation of \$200,000 was begun, which was increased in 1887 to \$400,000, and in 1900 to \$1,000,000. Between 1819 and 1825 various bills and propositions were advanced for a classification of the militia, so that only a small part of it should have duty to perform in time of peace, then a board was convened by the Secretary of War which made a report that was transmitted to Congress, recommending the instruction of officers in camps of instruction, ten days each year. Jackson urged encouraging volunteer organizations. The Secretary of War of President Van Buren's Cabinet, in 1840, proposed that 100,000 men apportioned to the States, be maintained by draft or otherwise, to serve four years, one fourth to go out each year, and to form the reserve, continuing as such four years more. The President to order the active portion on duty 30 days each year, and defray all charges for pay, subsistence etc. It is said that no subject, except finance, was more discussed prior to the Civil War, than the militia. The debates in Congress are full of it, reports and bills are numerous both from the War Office and the committees of the Senate and House, but as stated, they were unacceptable, until after the war with Spain. The language of the Constitution "reserving to the States respectively the appointment of the officers, and the authority of training the militia according to the discipline prescribed by Congress," has always been an insurmountable obstacle to Federal control of the militia in time of peace. As indicated, the Army and Congress long endeavored to secure the adoption of a plan to limit the militia to a practicable number, and the volunteer militia, or that proportion which the States have organized into companies or regiments, has, for many years, been regarded as a practicable number, as indeed it will always be, if motives of patriotism and eagerness to acquire military knowledge, can be made the incentives to volunteer, and it be understood by the people that the government wishes to maintain the force to embody such ideals only.

Military Law of 1903.—In 1903, the United States Congress adopted a new Militia Law, by which the militia was defined to be practically all able-bodied males between 18 and 45 years, divided into two classes, namely (a) "the Organized Militia," being such forces as may be created, under State laws, regardless of the name they bear, and (b) the remainder of the militia. A period of five years is given to all the States to

MILITIA

adopt laws making the organization, drill and discipline of their organized militia the same as that of the regular army, and the participation of the States in an annual appropriation of \$1,000,000 is made dependent on such State action, and the creation of forces accordingly; the limit in number of troops is apparently that of the law as it stood theretofore, to wit, 100 men for each Congressional representative; meanwhile those States which have been entitled to participate in the annual fund continue to do so, and at once their forces became a part of the "Organized Militia." Authority is given to the President to call forth such number of the militia "organized" or "reserve," as he may deem necessary, in case of invasion, danger of invasion, rebellion, or inability to execute the laws of the Union, and any officer or enlisted man who shall neglect to present himself to a mustering officer to be mustered into the service of the United States, if found fit, shall be subject to trial by court martial. No provision is made for such other portion of the militia who may be called forth. The time of such service shall not exceed nine months. The States are required to have each an Adjutant General, whose duties the State laws define, except as to reports to the Secretary of War; these the latter may prescribe. Provision is made for supplying the States on requisition with arms, belts, equipment, ammunition, etc., the same to remain the property of the United States government. The Secretary of War is required to cause annual inspections to be made, and such States as have the requisite organized militia may obtain so much of their allotment from the annual appropriation as shall be necessary to transport, pay and subsist such portion of their forces as shall engage in field or camp service. The Secretary of War may also provide for the participation of any part of the organized militia of any State in any camp or field maneuvers of the regular forces at or near military posts or defenses of the United States. These charges are from the appropriation for the Army. The militia appropriation is also available for stores, supplies, or publications; and States may also buy such property at army listed prices. The annual duty required is prescribed, and regular officers may be detailed to States for duty with the organized militia. Ammunition for firing and target practice may be supplied at regular military posts, and officers of the militia may be allowed to attend at military schools or colleges of the United States, and be examined to be certified for fitness to be commissioned. The application of the law will test the wish of the people to put a particular part or all of the militia under the control of national authority. The questions involved are national control of the militia in time of peace, national participation in the control of the militia, national control of all or part of the militia through the officers of the Regular Army, or national control through some other agency, wholly or in part under direction of the officers of the Regular Army.

National or State Guard.—For one hundred years the militia has been called the State force, being in time of peace under the State, as in England it was under the County; the new law while recognizing the States' control, seeks to secure uniformity and perfection through active national participation in control, and by

the contribution of money and property, and is reported by the War Department to be in process of successful solution. The term "National Guard" has been adopted by some States to designate its organized or volunteer militia. This appellation was adopted by one of the most famous militia organizations of the world, the 7th Regiment of New York, at the time Lafayette visited America in 1824, and in his honor, after the "Garde Nationale." The State of New York appropriated the term in 1862 to describe the organized militia, and other States have followed; but if the organized militia can be made and kept a volunteer body, founded on patriotic service, the term that Massachusetts has used, "Volunteer Militia," is more correct. The organized militia of the States bear names as follows: Georgia, South Carolina and Florida "State Troops"; Arkansas and Kentucky, "State Guard"; Louisiana, "State National Guard"; Rhode Island, "Militia"; Texas, "Volunteer Guard"; Virginia, "Volunteers"; Massachusetts, "Volunteer Militia." The remaining States use the term "National Guard." The War Department U. S. A. publishes a roster of the "Organized Militia of the United States," dated October 1903, showing a total force of 116,542 officers and enlisted men. A table compiled by Captain W. R. Hamilton, U. S. A., to 1 Dec. 1902, showed the State militia to comprise 1,791 generals and officers of their staffs, 4,951 cavalry, 6,671 artillery, 96,808 infantry, making a total of 110,221, for which the State appropriations were \$2,639,150 in addition to the national appropriation. The total number liable to military service is estimated at 8,727,500 men. The naval militia of the States aggregated 1 Jan. 1902, 433 officers and 4,447 petty officers and men. Heretofore militia of the United States meant militia called into the service of the United States. The volunteer militia of many of the States, notably New York, contain some military organizations so excellent in drill, discipline, rifle shooting and general military proficiency as to be easily comparable with corresponding bodies in the regular service. This is attained by the work of men who are fond of military labors, and who have patriotic pride in performing them, and by those who know how to utilize such elements in the community. As the officers and men maintain themselves, and oftentimes those dependent upon them, and have civic and social ambitions, as well as those of a military character, it is necessary to be judicious in selecting and managing volunteers, in order to inculcate military knowledge and maintain zeal for public service. It will thus be seen that the subject of the militia is a political, economic and patriotic question of statecraft. The military sciences and their representatives enter because the question relates to the embodiment of national force, but they enter only for the perfection of a result and not for its creation. The Chief Executive of a nation is its Chief Commander, but the military power is subordinate to the civil power, except when the military power must be exercised. Asserting that this should be always kept in mind, Hallam says: "Nothing would more break down this notion of the law's supremacy than the perpetual interference of those who are really governed by another law; for the doctrine of some judges that the soldier being still a citizen, acts only in preservation of the public peace as another is bound to, must be

MILITIA—MILK

felt as a sophism even by those who cannot find an answer to it."

Bibliography.—Concerning the English institution consult Edward, Earl of Clarendon, 'History of the Rebellion and Civil Wars in England'; Napier, 'Defence of England by Volunteer Corps and Militia'; Chamberlayne, 'State of England'; Grose, 'Military Antiquities respecting a History of the English Army'; Hallam, 'Constitutional History of England'; Macaulay, 'History of England'; Townshend and Windham, 'Plan of Discipline for Norfolk Militia' (1760); and for the United States, reference may be made to Elliott's 'Debates,' Curtis' 'Constitutional History of the United States,' American State Papers (Military Affairs), Congressional Debates, Reports of Secretaries of War, and of Congressional Committees, Messages of Presidents to Congress, opinions of Attorney Generals, and numerous Court decisions, both in the Federal and State Courts. Among the former, reference should be made to the opinions of Justices Washington, Johnson and Story (in *Houston v. Moore*, 5 Wheaton, 1), of Justice Story (in *Martin v. Mott*, 12 Wheaton, 19), of Chief Justice Taney (in *Luther v. Borden*, 7 How., 1).

CHARLES E. LYDECKER,
Major National Guard, New York.

Militia, Naval. See NAVAL MILITIA.

Milk may be defined as the normal secretion of the mammary glands. The milk of all mammals is similar in qualitative composition, consisting essentially of water, fat, proteids, milk-sugar and salts or ash. Colostrum, the fluid secreted for a short time immediately after giving birth to the young, is composed of similar substances, but differs considerably from normal milk in its quantitative composition and physiological properties. The average percentage composition of some of the more important milks is approximately as follows:

	Water	Fat	Pro- teids	Sugar	Ash
Human milk.	88.00	3.80	1.50	6.40	0.30
Cows' milk...	87.00	4.00	3.35	4.90	0.75
Goats' milk...	85.70	4.75	4.30	4.45	0.80
Ewes' milk...	80.80	6.85	6.55	4.90	0.90
Asses' milk...	89.50	1.75	2.00	6.25	0.50
Mares' milk...	90.75	1.20	2.00	5.70	0.35

Human milk varies to such an extent that any attempt to state its average composition is liable to be misleading. The percentage of any constituent, and especially that of proteids, may differ widely from that given above while the milk is still entirely normal. Such differences are found not only in the milk of different women but in that of the same woman at different periods of lactation.

Cows' milk differs from human milk in containing less sugar and considerably more proteids and ash. The proteids are also of a somewhat different character, the casein being more easily coagulated and forming a denser curd. Goats' and ewes' milks being rich in fats and proteids are well adapted to the manufacture of cheese and are largely used for this purpose in some parts of Europe. Asses' and mares' milks have been recommended as preferable to cows' milk for infant feeding, since they show some resemblance to human milk in the

amount and nature of the proteids which they contain. In this country, however, the milk of the cow is the only one of commercial importance. Unless otherwise explained all of the statements which follow will be understood to refer to cows' milk, but many of them are true of the milk of other mammals as well.

Cows' Milk.—The constitution of cows' milk has been concisely stated by Richmond: "It is essentially an aqueous solution of milk-sugar, albumin and certain salts, holding in suspension globules of fat, and in a state of semi-solution, casein together with mineral matter. Small quantities of other substances are also found." As regards its physical properties, milk is an opaque, white or yellowish fluid, somewhat heavier and more viscous than water, having a faint characteristic odor and a slightly sweetish taste. The yellowish color is due to the fat and the opacity and viscosity in part to the fat and in part to the casein and lime salts present. The specific gravity is usually between 1.029 and 1.034 at 15.5° C. (60° F.). Normal fresh milk shows toward litmus an amphoteric reaction, and reacts acid with phenol-phthaline. This property is attributed to the presence of phosphates and of carbonic acid. The gases contained in cows' milk, carbonic acid with small amounts of oxygen and nitrogen, are for the most part evaporated in the usual processes of handling the milk and therefore need not be further considered here.

Proportions of Water and Solids.—The proportion of water in cows' milk varies considerably, depending upon breed, individuality, period of lactation, etc. While the average amount is about 87 per cent, the mixed milk of a herd may easily show as much as 88 or as little as 85 per cent of water corresponding respectively to 12 or 15 per cent of solids. The milk of a single healthy cow in normal condition may sometimes contain as little as 10 or as much as 18 per cent of solids, while in extreme cases even these latter limits may be passed. The writer has found 19.88 per cent of solids in the milk of a perfectly healthy cow and 27.40 per cent in that of a cow having fever. Over 16 per cent of solids in the mixed milk of a herd or over 18 per cent in that of an individual is, however, comparatively rare.

Breed.—While much depends upon the individual cow, it is well known that some breeds tend to yield richer milk than others. The following figures, obtained by averaging the records of tests made at the New York and New Jersey Agricultural Experiment Stations, serve to illustrate the variation in richness of milk yielded by different breeds:

BREED	Total solids per cent.	Fat per cent.	Solids not-fat per cent.
Jersey	14.87	5.10	9.68
Guernsey	14.69	5.16	9.53
Shorthorn	13.38	4.95	9.33
Ayrshire	12.73	3.64	9.09
Holstein	11.96	3.43	8.53

Advance of Lactation.—After the third or fourth month, the milk tends to increase in richness as lactation advances. A study of nearly fifty lactation periods of individual cows at the New York State Experiment Station, yielded the following average results, the observation being continued in each case for ten months:

MILK

MONTHS	Total solids per cent.	Fat per cent.	Solids not-fat per cent.
First month.....	14.00	4.54	9.46
Second month.....	13.50	4.33	9.17
Third month.....	13.47	4.28	9.19
Fourth month.....	13.64	4.39	9.25
Fifth month.....	13.75	4.38	9.37
Sixth month.....	14.00	4.53	9.47
Seventh month.....	14.18	4.56	9.62
Eighth month.....	14.33	4.66	9.67
Ninth month.....	14.46	4.79	9.67
Tenth month.....	14.83	5.00	9.83

In the last few days of lactation, when the yield becomes very small, the proportion of solids often rises to a marked degree, sometimes reaching 20 per cent or over.

Food, Weather, etc.—Other conditions being the same, milk is richer in winter than in summer, in cooler than in warmer weather, and on rich dry food than on pasture, except that on first turning the cows to pasture a richer milk may be obtained for a time. Probably anything which induces a greater consumption of food has a tendency to increase at first the richness of the milk secreted. In most cases, however, such increase in richness is found to be only temporary, the more permanent influence of better feeding being to improve the quantity rather than the quality of the milk produced.

Partial Milking.—All of the statements regarding the composition of milk refer to the product of a complete milking. In partial or fractional milking the first portions drawn are comparatively poor and the last portions or "strippings" are much richer.

Milk Fat.—Milk fat, like other fats, is a mixture of glycerides (compounds of glycerine and fatty acids). It differs from other animal fats in containing a smaller proportion of stearic acid and large proportions of the acids of lower molecular weight. A recent study of the constitution of milk fat by Browne gave the following results:

ACID	Per cent of acid obtained	Corresponding per cent of glyceride
Oleic	32.50	33.95
Dioxy-stearic	1.00	1.04
Stearic	1.83	1.91
Palmitic	38.61	40.51
Myristic	9.89	10.44
Lauric	2.57	2.73
Capric	0.32	0.34
Caprylic	0.49	0.53
Caproic	2.09	2.32
Butyric	5.45	6.23
Total	94.75	100.00

The last four acids are the "volatile fatty acids," the large amount of which serves to distinguish milk fat (butter) from other fats which as a rule have only a fraction of a per cent of these acids. In the milk the fat exists in the form of minute suspended globules which vary considerably in size but average about $\frac{1}{1000}$ of an inch in diameter. A drop of average milk contains over 100,000,000 fat globules. Formerly it was believed that each globule was surrounded by an envelope of proteid matter, but it now appears certain that no such envelope exists and that the fat particles float freely in the milk in the form of an emulsion.

Amount of Fat in Milk.—The percentage of fat in milk varies more than that of any other solid constituent, or indeed, of all the other solids combined. In the mixed milk of herds where the influence of individual cases of advanced lactation is minimized, we may consider the usual range to be from 3 to 6 per cent of fat and from 8.5 to 9.5 per cent of solids not fat. Hence the varying richness of cows' milk is due principally to differences in fat content, and as fat is also the constituent of greatest pecuniary value, a "rich" milk is essentially one containing a high percentage of fat.

Nitrogenous Compounds or Proteids of Milk.—Not all of the nitrogenous compounds found in milk are true proteids, but since the amount of nitrogen in other forms is exceedingly small, it has become customary to use the term proteids or "protein" as synonymous with nitrogenous compounds. The number of such compounds which have been reported as occurring in milk is quite large. Some of these, however, are accidental or abnormal constituents and others occur only in very minute quantities. The greater part of the nitrogen in milk (usually over three fourths) is in the form of casein, a compound proteid which contains phosphorus in organic combination and is probably also combined with lime salts. Casein is readily coagulated by acids or rennet and the curd thus formed encloses the greater part of the fat which the milk contained. Of the nitrogen compounds other than casein, albumin is by far the most abundant. Milk albumin is not coagulated by rennet, nor by acids at ordinary temperatures, but is coagulated by heat. In addition to casein and albumin, milk contains small amounts of other proteid bodies including the enzymes or unorganized ferments which play an important part in cheese-making, and probably aid the digestion when milk is consumed in the fresh state without previous heating. Among the nitrogenous compounds other than proteids which have been found in milk, may be mentioned small amounts of lecithin, hypoxanthin, creatin or creatinin, urea, and traces of ammonia.

Amount of Proteids in Milk.—Formerly, through faulty methods of separation, the reported percentages of proteids were very often inaccurate and were usually too high. The amount of proteid matter as determined by modern methods is usually between 3 and 4 per cent, being higher in those samples which are rich in fat. Average milk with 13 per cent of solid matter usually contains about 4 per cent of fat and $3\frac{1}{2}$ per cent of proteids. In richer milk the increased amount of solids is usually made up of about three fourths fat and one fourth proteids. In other words, the percentages of fat and proteids tend to rise and fall together approximately in the proportion represented by the formula—Proteids = $2.00 + \frac{1}{2}$ Fat. Variations in fat, especially if due to temporary causes, are not always accompanied by so much variation in proteids as the formula would indicate. On the other hand, the percentage of proteids is apt to exceed that indicated by the formula, in very advanced lactation. As a rule when the amount of solids-not-fat exceeds 9 per cent, the excess is due chiefly to excess of proteids.

Milk-Sugar.—Milk-sugar, or lactose, has the same composition as cane-sugar, but differs from the latter in some of its chemical properties and

MILK

is less sweet and less readily soluble in water. The amount of sugar is rather more constant than that of proteids, being usually between 4.5 and 5.25 per cent in normal milks. While the latter figure is rarely exceeded, occasional samples may show considerably less than 4.5 per cent. In any genuine milk containing an unusually low percentage of solids-not-fat, the deficiency is apt to be principally in the milk-sugar. Such milk is apt to be yielded in case of fever or unusual excitement or fatigue, and may sometimes be obtained from apparently healthy cows under normal conditions, especially during hot, dry weather.

Salts or Ash of Milk.—When milk is dried and burned there remains a white ash, the average composition of which is stated by Fleishmann and Schrodt to be:

	Per cent
Potassium oxide	25.42
Sodium oxide	10.94
Calcium oxide	21.45
Magnesium oxide	2.54
Ferric oxide	0.11
Sulphuric anhydride	4.11
Phosphoric anhydride	24.11
Chlorine	14.60
	103.28
Less oxygen equivalent to chlorine.....	3.28
	100.00

A part of the phosphoric anhydride of the ash is derived from the phosphorus of the casein. The sulphuric anhydride also comes from the oxidation of the milk proteids. If these acid constituents are deducted, the bases in the ash are found to be in considerable excess. In the milk these bases are combined partly with the casein and partly with citric acid, a very small quantity of the latter being a normal constituent of cows' milk. The amount of ash does not, therefore, exactly represent the mineral matter originally present. The ash of normal milk is usually between 0.65 and 0.80 per cent, averaging about 0.73 per cent. The ash tends to vary with the proteids approximately in the proportion—Ash = $0.38 + 1/10$ Protein.

Preservation of Milk.—Milk produced under usual conditions contains large numbers of bacteria. At ordinary temperatures these multiply rapidly and soon cause such changes as to render the milk unsalable, if not unfit for use. Various preventive measures may be adopted, either to prevent bacteria from getting into the milk, to check or control their growth, or to destroy them entirely. Strict cleanliness and the use of sterilized utensils exclude a large proportion of the bacteria usually present in milk and greatly improve its keeping qualities. If such milk is protected from access of air and kept cold, it will remain sweet and fresh for at least two or three weeks without any other preservative measures. The sanitary production and handling of milk are more fully described in the article: DAIRY INTERESTS, AMERICAN. In this respect the American dairy practice is much in advance of that of other countries, as was strikingly shown at the exhibit of dairy products at the Paris Exposition of 1900. Three dairies engaged in city milk supply, one in New York, one in New Jersey, and one in Illinois, sent regular shipments of fresh milk and cream to Paris throughout the summer. These products were found to be sweet and sound when opened from 15 to 20 days after bottling, and it was

only with great difficulty that European dairy experts could be convinced that nothing but "cleanliness and cold" had been used to preserve them. No other country except France attempted to show natural milk and cream and the French exhibits were all sour on the second or third day.

It is evident that milk may be preserved much longer than is usually necessary by the observance of cleanliness to exclude bacteria as far as possible and the maintenance of a low temperature to retard the growth of those present. In order to preserve milk produced under unsanitary conditions or which has been carelessly handled and not kept properly cold, it is sometimes necessary to adopt other methods to kill the bacteria present or to retard their growth. For this purpose milk is either heated or treated with chemical preservatives.

Sterilization and Pasteurization.—When milk is heated to the boiling point, all active bacteria are killed. Such milk is commonly called "sterilized," but is not strictly sterile because of the presence of spores which subsequently develop into active bacteria. In order to render milk absolutely sterile, it must be heated several times at intervals until all of the spores have developed into bacteria and been killed. Boiled milk is somewhat changed in appearance and has a "cooked" taste, which is unpleasant to most people. Heating to a temperature of 140° F. destroys the greater number of the bacteria usually found in milk, including any disease germs likely to be present and all those species to which the ordinary souring of milk is due. This process is called pasteurization. It is very generally practised abroad and until recently has been advised by many writers in this country. But the recommendations for pasteurization made by European writers have little application in America, where a better milk supply is available and ice is much more freely used, and it is now known that the pasteurization of milk is attended with serious disadvantages. Thoroughly pasteurized, or ordinary so-called "sterilized," milk will seldom sour, but unless kept very cold certain spores which are often present will germinate and produce bacteria which attack the proteids, forming products more or less poisonous, which are believed to be the cause of many of the digestive disorders, especially of infants and children. In natural milk such products are rarely formed in any appreciable quantity, because the more rapid growth of the lactic acid bacteria prevents the development of those species which attack the proteids. The heating of milk tends in itself to change the proteids somewhat and render them slightly less digestible, at the same time destroying the activity of the enzymes present which are believed to aid digestion. It is evident, therefore, that the heating of milk to improve its keeping quality is not to be recommended where ice is obtainable, and that when pasteurization is resorted to through fear of disease germs, the milk should nevertheless be kept cold until used. The public should demand milk produced under such known and satisfactory conditions as to make pasteurization wholly unnecessary.

Chemical Preservatives.—Various substances have the power of preventing or retarding the growth of bacteria. Those most often used to prevent milk from souring are boric acid or borax, and formaldehyde. Less frequently

MILK

salicylates, chromates, fluorides, and other substances may be found. All of these substances are highly injurious when taken in sufficient quantity and their use is illegal in most States, but they are often sold under fanciful names and doubtless frequently used without knowledge of their real nature. According to the Year-book of the United States Department of Agriculture for 1900, boracic acid and borax are sold as "Preservaline," "Superior Preserving Powder," "Nonpareil Preservative," "Australian Salt," "Antisepticum," "Antisourine," "Ozone Antiseptic Compound," "Rex Magnus, Snow Flake Brand," etc.; Formaldehyde or "Formalin" as "Freczine," "Icline," "No Ice Needed 'M' Preservative," "Patent 'M' Preservative," "Milk Sweet," etc. The strongest incentive to the use of such preservatives is the saving of ice, and it is safe to say that as a rule their use tends to encourage carelessness and neglect not only as to refrigeration but as to cleanliness as well. The attempts to determine the exact physiological effects of small amounts of these substances have given somewhat conflicting results, and the claim is sometimes made that the quantities which would be used as food preservatives would not be sufficient to cause any injury to health. It may, however, be accepted as a general principle that any substance which prevents fermentation to such an extent as to be useful as a preservative must to some extent retard the action of the digestive ferments, and it is entirely probable that an amount too small to have an appreciable effect upon a healthy adult might be highly injurious to an infant or an invalid. Since milk often forms the sole food of infants and invalids, the use of chemical preservatives is more highly objectionable in milk than in other foods and should be strictly prohibited.

Milk is sometimes treated with carbonate or bicarbonate of soda which neutralizes the lactic acid which would otherwise make the milk sour. These substances do not check the growth of bacteria but simply mask the results of their activity. By neutralizing the lactic acid they favor the growth of the bacteria which attack the proteids as well as those which affect principally the milk-sugar. Such milk, therefore, tends to become unwholesome more rapidly than milk to which nothing is added.

Methods of Analysis and Detection of Adulterations.—The complete analysis of a sample of milk requires much time and elaborate apparatus and is not practicable for others than trained chemists. The tests described below are more easily performed and if carefully carried out will in many cases yield all the information required. Before taking a portion for any determination the milk to be tested should be thoroughly mixed by repeatedly pouring it from one vessel to another.

Determination of Fat.—Since fat is both the most valuable and the most variable of the solids in milk, its determination is often required. This may be accomplished by the method devised by Dr. S. M. Babcock, of the Wisconsin Agricultural Experiment Station, and popularly known as the Babcock test. In making this test, a measured amount of milk is treated with about an equal volume of commercial concentrated sulphuric acid which dissolves the other constituents, leaving the fat free in a heavy solution from which it is separated by centrifugal

force and collected in the graduated neck of the test bottle, where its volume is read off at once on the completion of the test. Complete directions are furnished with the testing outfit, which can be purchased for a few dollars from dealers in chemical apparatus or dairy supplies.

Determination of Specific Gravity and Estimation of Solids-Not-Fat.—Since the specific gravity of milk is raised by all of the other solids and lowered by the fat, it follows that after the influence of each has been determined, it should be possible to estimate from the percentage of fat and the specific gravity the percentage of solids-not-fat which the sample contains. To determine the specific gravity it is convenient to use a "Quevenne" or a "Soxhlet" lactometer, either of which is practically a hydrometer of sufficient range to cover the gravity of all ordinary milks and so graduated that the thousandths in excess of unity are represented by whole numbers on the scale. Thus a milk with a specific gravity of 1.0315 will give a lactometer reading of 31.5. The temperature should be observed at the same time with the lactometer reading and the latter corrected to 60° F. by adding to the reading 0.1° for each degree F. above the standard temperature of 60° F. One fourth of the corrected lactometer reading plus one fifth of the percentage of fat gives a fairly close approximation to the percentage of solids-not-fat. The lactometer reading may also be useful aside from the estimation of solids-not-fat. Although the addition of cream to milk would lower the gravity, yet in general the lactometer reading is a rough indication of the richness of the milk, because a high percentage of fat is usually accompanied by a high percentage of proteids which raises the lactometer reading. Cases in which genuine milk shows a low gravity as the result of a high percentage of fat are not common and can usually be detected by noticing the viscosity and opacity of the milk as it runs from the bulb of the lactometer. The lactometer reading taken in connection with the appearance is therefore a useful preliminary test and is used as such by the milk inspectors of many cities.

Detection of Skimmed or Watered Milk.—The most common adulterations of milk are the removal of cream (or the addition of skimmed milk, which amounts to the same thing), and the addition of water. For the detection of such practices there are no satisfactory direct tests. Milk which contains less than 3 per cent of fat has usually been partially skimmed, and milk containing less than 8.5 per cent of solids-not-fat has usually been watered, but poorer samples of genuine milk are occasionally found. In most States there are minimum limits established by law and milk falling below the limit is considered to be adulterated. Thus in New York State milk must contain at least 3 per cent of fat and at least 12 per cent of total solids; in Georgia at least 3.5 per cent of fat and 8.5 per cent of solids-not-fat. As stated above, the percentage of fat varies much more than that of solids-not-fat. Skimming is therefore more difficult to detect than watering. In fact, it is usually impossible to distinguish by analysis between a genuine sample containing, say, 3.6 per cent of fat and a sample originally containing 4.5 per cent of fat, one fifth of which has been removed. On the other hand, the addition of 20 per cent of water would almost certainly

MILK-CURE — MILK-SICKNESS

reduce the percentage of solids-not-fat to a figure considerably below the normal minimum.

Other Adulterants.—The addition of chalk, calves' brains, etc., though frequently mentioned in the older works on food adulteration, is now almost unknown. Cane-sugar or starch may sometimes be added to mask the effect of watering. The former may be detected by the rose-red color produced when about 10 cubic centimetres of milk are boiled for five minutes with 1 cubic centimetre of hydrochloric acid and 0.1 gram of resorcin. To detect the presence of starch, boil about 10 cubic centimetres of milk, cool it thoroughly and then add a few drops of a solution of iodine in potassium iodide. If starch is present a characteristic blue color will be produced.

Artificial Coloring Matter.—Caramel or yellow coloring matter such as is commonly used in butter may occasionally be added to milk. The detection of these is of little practical importance, since they would ordinarily be used only to mask the effects of gross skimming or watering such as would be readily detected by the methods already given.

Detection of Heated Milk.—It has already been stated that milk contains enzymes, the activity of which is destroyed by heating. At least one of these has the property of decomposing hydrogen peroxide with the liberation of nascent oxygen. This property forms the basis of several tests for distinguishing between raw and heated milk. According to Leffmann the best reaction is obtained with 1-4 *diamidobenzene*. When a freshly prepared dilute solution of this substance is added to raw milk and then a few drops of hydrogen peroxide solution, a deep blue color at once appears. Milk which has been heated to 180° F. does not give this reaction.

Detection of Preservatives.—**FORMALDEHYDE** ("FORMALIN").—Dilute the milk with an equal bulk of water in a test tube and carefully pour in commercial concentrated sulphuric acid, inclining the tube so that the acid and milk will not mix. If formaldehyde is present a violet ring forms at the junction of the two liquids. If pure acid is substituted for the commercial, a trace of some ferric salt should be added. **SALICYLIC ACID.**—To 50 cubic centimetres of milk add an excess of an acid solution of mercuric nitrate, shake and filter. Shake the filtrate with ether in a separatory funnel, separate, evaporate the ether layer and to the residue add a drop of neutral solution of ferric chloride. In the presence of salicylic acid a violet color is produced. **BORACIC ACID OR BORAX.**—Evaporate a portion of the milk to dryness and burn to ash. Moisten with a few drops of dilute hydrochloric acid and introduce a slip of yellow turmeric paper. This is turned reddish brown by boracic acid and the color may be changed to bluish black by treating with a solution of sodium carbonate. **CARBONATES OR BICARBONATES** if present in the milk would remain as carbonate after ignition and be shown by an effervescence when the ash was moistened with acid in the test for boracic acid just described.

H. C. SHERMAN, Ph.D.,
Columbia University, New York.

Milk-cure. The living on milk alone, or mainly, for weeks is a recognized form of treatment in obstinate hysteria, hepatic congestion, dropsy, and various disorders of nutrition. When the taste of milk becomes disagreeable, salt, coffee, bread, arrowroot, cocoa, rice, etc., may be added as the attending physician decides. The sole use of milk for a length of time may increase the frequency of the pulse, stimulate the kidneys to undue action, coat the tongue, and produce obstinate constipation. When used exclusively, two or more quarts are ordinarily consumed daily. It is not a cure to be undertaken without the supervision of a physician.

Milk-fever (called ephemeral fever when the symptoms disappear very quickly) is a febrile state, the temperature reaching 102° F. or over, occurring in the mother usually two or three days after delivery. It chiefly affects those in a feeble condition or under- or over-fed, or in whom the milk-ducts have not been freed by early lactation. A chill may induce it. It occurs in the lower animals as well as in the human being. It begins with rigors, which are followed by headache, pains in the limbs, fever, swelling and tenderness of the breasts (going on, it may be, to abscesses), and sweating, when the symptoms abate. Pain is to be relieved by hot-water bottles, breasts to be emptied, bowels moved by salines, and fever reduced by diaphoretics; other medicines may be necessary. Owing to antiseptic midwifery, and greater care as to hygienic measures, milk-fever is now-a-days comparatively rare. If not relieved promptly by medical skill, it may prove a dangerous disease.

Milk, Human. This liquid has a specific gravity of 1028.34, and contains water, 87.4; total solids, 12.6; fat, 3.4; albuminoids, 1.2; sugar, 7.0; ash, 0.2. It is slightly alkaline, is sterile, and differs mainly from cow's milk in being sweeter and having less fat and casein. Its fat is more fluid, and the casein is more readily dissolved. Cows' milk is frequently acid, and its casein is often digested with difficulty. Experience shows that an infant should, if possible, be nursed during the earlier months of its life, for human milk is usually adapted to the digestive powers of infants. Its alkalinity, its temperature (98°–100° F.), its chemical constituents aid the development of the child. But poor health of the nurse, mental emotions, improper food, or deranged digestion of the infant may prevent natural feeding or require its cessation.

Milk-leg. See PHLEGMASIA.

Milk-sickness (sometimes called "trembles"), a malignant fever attacking man and some of the lower animals, such as unweaned

MILK SNAKE—MILL

calves and their mothers, horses and colts, sheep and goats. Formerly it prevailed in the Western and Southwestern States, recently in North Carolina and Indiana. The cause is not known, though supposed to exist in poisonous herbs eaten by cattle. Man is supposed to be infected by the products of cattle—meat, milk, cheese, or butter. The disease belongs to the end of summer and the beginning of autumn. The symptoms are headache, loss of appetite, fatigue, nausea, vomiting, thirst, constipation, a foul breath, then a typhoidal condition with coma or convulsions. The prognosis is generally favorable, but death may occur in a few days. The duration of the disease is from two or three days to as many weeks. The treatment is supportive and symptomatic.

Milk Snake. See **HOUSE-SNAKE**.

Milk Stone, or **Galalith**, an artificial substitute for horn, ivory, ebony, amber, etc., made of casein by the following process. Curds are dissolved in hot soapy water, and colored to the proper tint. A precipitate is obtained by a metallic salt; this is thinned and dried on a cloth-covered frame. The resulting mass is rendered insoluble by the addition of formaldehyde. Milk stone is cheaper than the natural materials for which it is a substitute, and is less odorous and inflammable than celluloid.

Milk-tree, any of various tropical trees yielding a milky, wholesome sap. See **COW-TREE**.

Milk-vetch, a pea-plant of the genus *Astragalus* (see **VERTIC**), regarded as increasing the flow of milk when eaten by goats. Many species grow in the United States, especially on the Western plains, where they are useful fodder-plants, although including one baneful species, the locoweed (q.v.).

Milk-weed. See **ASCLEPIAS**.

Milkweed, or **Monarch Butterfly**, a large, reddish-brown, black-veined nymphalid butterfly (*Atrosia plexippus*) of North America. Its black and green caterpillars, which have a pair of black filaments at each end of the body, are found upon milkweed almost throughout the world. The bright green, gold-dotted chrysalids hang from the under sides of the leaves in mid-summer. The adults which are among the strongest flyers of their order, migrate southward in the autumn and hibernate. In spring they fly northward even into Canada. They often form immense flocks in glades, even concealing the bark of trees upon which they alight in the lea of the wind. They are protected from their enemies by scent scales and are imitated by species not so protected, especially in the United States by the viceroy butterfly (*Easilarchia disippus*).

Milky Way, **The**, or **The Galaxy**, in astronomy a luminous band of irregular form, consisting of a great circle entirely surrounding the heavens. It contains myriads of stars, so crowded together that their united light only reaches the unaided eye; this band of stars can be seen on any dark, clear night. If we could stand where the earth is and have it removed, we could see this splendid circle completely surrounding us; it is thus reasoned that we are a part of the Milky Way, and that our sun is near the centre of it. The circumpolar constellations Cassiopeia and the Swan are always to be found in the Milky Way, while Sirius,

Capella, and Aquila may be seen on its edge when they are in sight. The formation of the Milky Way assumes the general appearance of a silvery ribbon, but in places it is divided into two great branches, which afterward reunite. Between these divisions are dark places comparatively devoid of stars; one of these, the Coal Sack, has become celebrated, and was so named by sailors because they could see no stars in this dark spot.

Mill, James, British economist, historian, and utilitarian philosopher: b. Northwater Bridge, Forfarshire, Scotland, 6 April 1773; d. Kensington 23 June 1836. His father was a cobbler, his mother a farmer's daughter, and his early abilities were so marked that great care was taken with his education, so that in 1790 he entered Edinburgh University. There he was carried away with Dugald Stewart's philosophy until he came to know Bentham's system, which he then adopted. But in the University he was better known as a remarkable Greek scholar than as a philosopher. In 1802 he went to London, where he was from 1803 to 1806 editor of the 'Literary Journal,' and then began the 'History of India,' which occupied him ten years. During this time he wrote much for periodicals and came to know Bentham personally; at the same time he was busied with the painstaking education of his children, notably John Stuart Mill (q.v.). The 'History of India,' a wonderfully scholarly and unpartisan work, marred only by his lack of personal knowledge of country and people and a consequent theorizing at times, was published in 1818 and immediately won for him a place in the India Office and relief from his long battle with penury. This position was the more flattering a tribute since he was now well known as a radical and a skeptic. He rose rapidly, becoming head of the Office in 1830. The 'Westminster Review' founded in 1824 as the organ of Bentham's followers contained many contributions by Mill; and several appeared in the 'London Review.' Both in ethics, where his position was strongly utilitarian, and in political economy, where he may still be reckoned as typical of the orthodox school so bitterly attacked by Ruskin, Mill is little more than a follower of Bentham, with greater force, perhaps, because of his comparatively larger knowledge of the world. In psychology, however, although largely a follower of Hartley, his work is more important, for he developed and gave to Hartley's principle of association a wider application, and thus was the founder of the school to which Spencer and Bain belong. Mill took part in politics and contributed largely to the success of the Reform Bill by introducing to England philosophical radicalism. His personal character was strangely unhuman and unlovable, though perfectly correct. His important works besides the 'History of India' are 'Elements of Political Economy,' the first great philosophic treatise on the subject (1821), and 'Analysis of the Phenomena of the Human Mind' (1829). Consult: Bain's biography (1882) and J. S. Mill's 'Autobiography' (1867).

Mill, John Stuart, English philosopher and political economist: b. London 20 May 1806; d. Avignon, France, 8 May 1873. He was the son of James Mill (q.v.), and was educated entirely by his father. It is said he began the study

of Greek at 3; when he was 8 he had read, among other authors, the whole of Herodotus, the 'Cyropædia' and 'Memorabilia' of Xenophon, and six Dialogues of Plato. At the same age he began the study of Latin, and had read more than most college students have in their college course when he was 12; he had also read an unusual amount of history; and at 13 he began a complete course in political economy under his father's instruction, studying the writings of Ricardo and Adam Smith.

In 1820 he went to France for a year; during this time he visited the economist J. B. Say, and remained for some time with the brother of the philosopher, Jeremy Bentham. In 1823 he entered the East India Company's service as clerk in the examiner's office, and for 33 years continued in the political department of the office, connected with the transactions of the company with native States. During this period he formed the acquaintance of Grote, Macaulay, Ricardo, Bentham, F. D. Maurice, and others. He was selected by Bentham to superintend the publication of his work on the 'Rationale of Evidence,' which appeared in 1827 with notes and several supplementary chapters by Mill. From this time he became a regular contributor to the 'Westminster Review'; and from 1835-40 he was editor and part proprietor of the 'London and Westminster Review,' in which many of his own articles appeared. In the service of the East India Company he rose from grade to grade till he succeeded in 1856 to the position formerly held by his father as chief examiner. He drew up in 1858 the petition of the company against the transference of the government of India from the company to the crown. He declined a seat in the new India council, and retired with a compensating pension. In 1865 he was elected member of Parliament for Westminster; he opposed the ballot, supported Harcourt's scheme for the representation of minorities, and advocated the representation of women. He lacked both the popular eloquence and personal qualities to make himself a leader, and lost the election in 1868; he, however, made a strong impression upon Gladstone who called him the "Saint of Rationalism." After this he lived in private, spending a considerable part of his time in Avignon. In 1851 he married Harriet Taylor, a widow with whom he had been on terms of intimate friendship during her husband's life; she died in 1859, and he continued to cherish her memory "as a religion."

His first great work was his 'System of Logic, Ratiocinative and Inductive,' published in 1843; his other important works are: 'Essays on Some Unsettled Questions of Political Economy' (1844); 'Principles of Political Economy' (1848); 'Liberty' (1859); 'Considerations on Representative Government' (1861); 'Utilitarianism' (1862); 'An Examination of Sir William Hamilton's Philosophy,' and 'Auguste Comte and Positivism' (1865); 'Dissertations and Discussions, Political, Philosophical, and Historical' (1867); the 'Subjection of Woman' (1869); 'Program of the Land Tenure Association' (1871). His 'Autobiography' was published after his death; also three essays on 'Nature' the 'Utility of Religion,' and 'Theism' (1874).

Mill's moral worth and elevation of character impressed all who knew him. Herbert Spencer speaks of his generosity as "almost romantic";

and his entire life was one of singular devotion to the improvement of mankind. His intellectual activity was remarkable on account of the various fields to which it extended. He was a specialist of distinction in logic and mental philosophy generally, in moral science, in political philosophy, in political economy, and in social philosophy—of which his political economy was only a part. While attaining high rank in each of these fields, his interests were so broad that he avoided the dangers of narrow specialism. His interests even extended beyond the humanities; for he was an enthusiastic botanist, and contributed botanical articles to scientific magazines. He was a positivist in his philosophy, in so far as he adopted some of the leading principles of Auguste Comte; but in his historical relations as well as in its fundamental principles, his philosophy does not belong to positivism but to the school of speculative empiricism, successively and variously developed by Locke, Berkeley, Hume, Hartley, and James Mill, the aim of which is to establish a psychology on the basis of experience and in alliance with the natural sciences. In his 'Examination of Sir William Hamilton's Philosophy' he adopts the view of Berkeley and Hume that the absolute distinction popularly conceived to exist between mind and matter, and maintained by the Scotch realistic school has no existence; and he defines matter as a permanent possibility of sensations, and mind as a series of actual and the base of possible states of consciousness. His 'Logic' has in all countries a high reputation, and must rank among the great treatises on logic of all times. He is frequently called the founder of the inductive logic, so great was the contribution which he made in his treatment of induction.

His chief contribution to ethics is found in his work on 'Utilitarianism'; and this gives him his position in the history of ethical thought. His utilitarianism was what he himself called the "greatest happiness" principle; not the greatest happiness of the individual merely, but the greatest happiness of society; this thought of the greatest happiness as the ultimate test of conduct in the individual and in society runs all through his writings and is fundamental. Mill, however, adds to the utilitarianism of Bentham considerations of the quality of happiness; it was not merely the highest quantity of happiness which must be sought but the highest sorts of happiness. He advocated government by the people because, among other things, political activity carried with it an intellectual and ethical education. Political interests were the first, he maintained, to enlarge men's minds and thoughts beyond the narrow circle of the family. A marked feature of what he wrote on politics was his advocacy of the enfranchisement of women. He was always a champion of women's rights and thought there were no fundamental differences in mind and character between the sexes. Keenly conscious of the dangers of democracy he wished measures adopted, on the one hand to prepare men and women by education for self-government, and on the other to prevent a tyranny of the majority. Consequently he was an advocate of a representation of minorities in legislative bodies. In his 'Principles of Political Economy' he assumed the position of a logical exponent of the principles of the utilitarian school of Adam Smith Ricardo, and James Mill; but he added large humanitarian

MILL — MILL SPRINGS

and social considerations which are hardly consistent with the foundations on which he built; but it is as a part of a system of social philosophy that this political economy is most interesting. His thoughts were directed to the improvement of the condition of the masses; an improvement to be brought about gradually, through an enlargement of economic and political opportunities. He advocated taxation and regulation of inheritance and bequest which would break down large fortunes and bring about a wider diffusion of property; and the appropriation of the "unearned increment" of land, or future increments in the rent of land due to the progress of society and not to exertions of the individual land-owner. His last public act was the foundation of the Land Tenure Reform Association, designed to carry out this idea of the appropriation of the future unearned increment by society. His views gradually changed in the direction of socialism; but he appears to have reached no definite conclusion. He dreaded particularly tyranny over the individual, and on this account rejected all schemes of socialism with which he was familiar; but considered "The social problem of the future to be how to unite the greatest individual liberty of action with a common ownership in the raw material of the globe and an equal participation of all in the benefits of combined labor."

Mill' (1893); Courtney, 'Life of John Stuart Mill' (1889); and 'Metaphysics of John Stuart Mill' (1879); Douglas, 'John Stuart Mill, a Study of his Philosophy' (1895); and 'Ethics of John Stuart Mill' (1897); Harrison, 'Tennyson, Ruskin, and Mill' (1900); Killick, 'Students' Handbook Synoptical and Explanatory of J. S. Mill's System of Logic' (1870); McCosh, 'An Examination of J. S. Mill's Philosophy' (1880); Robertson, 'John Stuart Mill' (in his 'Modern Humanists'); Spencer and others, 'John Stuart Mill, his Life and Work' (1873); Stebbing, 'Analysis of Mill's System of Logic'; Stephen, 'The English Utilitarians' (1900); Watson, 'Comte, Mill, and Spencer, an Outline of Philosophy' (1895).

Mill, the general name of a machine for grinding, crushing, or pulverizing. Also a lapidary's grinding wheel, known as roughing mill. Also a machine, or complication of engines or machinery, for working up raw material; as, a cotton mill, a spinning mill, a saw mill, an oil mill, etc. In die-sinking, the hardened steel roller having the design in cameo, and used for impressing in intaglio a plate, as in the bank-note system of engraving; or a copper cylinder, as in the process of engraving cylinders for calico printing.

Mill-boy of the Slashes, a sobriquet bestowed upon Henry Clay (q.v.) (1777-1852), from the reason he was born near Hanover County, Va., known as *The Slashes*, a local term for a low, swampy country. There was a mill here where he was often sent on errands as a boy.

Mill on the Floss, *The*, a novel by George Eliot, published in 1860. It is, like 'Middlemarch,' a tragedy, though a tragedy destitute of the usual heroic setting and grandiloquent circumstances. The author found her tragic

material in commonplace lives and traced the workings of fate in the obscure development of a young girl, with passions no less strong than those of a woman in some ancient Greek tragedy, suffering in a magnificent environment, under the gaze of the world.

Mill Springs, Ky., village in Wayne County; on the Cumberland River; about 90 miles south of Frankfort. It has steamer connections with places on the Cumberland and Ohio rivers. A battle was fought here on 19 Jan. 1862, between a Federal force of 4,000 men, under Gen. George H. Thomas, and a Confederate force, about the same number, under Gen. George B. Crittenden. The Federals were successful. The names, "Battle of Fishing Creek," "Battle of Logan's Cross Roads," and "Battle of Mill Springs" are given to this engagement. A National cemetery located here contains 718 graves of soldiers; 366 are of unknown dead.

Mill Springs, Battle of. The opening of the Kentucky-Tennessee campaign of 1862. At the close of 1861 the Confederate line extended from Columbus, Ky., on the Mississippi, through Fort Henry on the Tennessee, Fort Donelson on the Cumberland, Clarksville, Tenn., and Bowling Green, Ky., to Mill Springs on the Cumberland. Gen. A. S. Johnston was in chief command. Gen. D. C. Buell was the opposing Union commander. Gen. F. K. Zollicoffer established the Confederate right at Mill Springs early in December. Gen. Geo. B. Crittenden took general command there at the middle of the month, with the brigades of Zollicoffer and W. H. Carroll under him. Gen. Leonidas Polk held the Confederate left at Columbus, Gen. J. B. Floyd reached Fort Donelson 13 February, and had under him Gens. Pillow, Buckner, and Bushrod Johnson. Gen. A. S. Johnston was at Bowling Green, the centre. Gen. Geo. H. Thomas was on the Union left, with Gen. Schoepf immediately opposed to Zollicoffer, while Gen. Buell, with headquarters at Louisville, was in close communication with the Union centre, which threatened Bowling Green and Nashville.

Gen. Zollicoffer having crossed from Mill Springs to the north bank of the Cumberland and intrenched his position, from which he threatened central Kentucky, Gen. Thomas was sent against his forces, now commanded by Gen. Crittenden, from the direction of Lebanon. On 18 January Gen. Thomas reached Logan's Cross Roads about 10 miles from Crittenden's intrenchments. The latter officer, with the purpose of attacking before Thomas could concentrate his forces, marched at midnight of the 18th with Zollicoffer's and Carroll's brigades, consisting of eight regiments of infantry, six guns, and four battalions of cavalry, and attacked Gen. Thomas soon after daylight of 19 January.

The Union troops, consisting of six infantry regiments, one battery, and a portion of a cavalry regiment, were brought rapidly into action, both sides fighting with spirit. Finally, when three fresh Union regiments fell on the Confederate right, and the 2d Minnesota was pouring a galling fire upon the centre, the 9th Ohio (German Turners) made a brilliant bayonet charge completely turning the Confederate left, resulting in the Confederate lines breaking and retiring in confusion. At this point Gen. Schoepf's brigade from Somerset reached the field, and the whole force continued in pursuit, reaching

MILLAIS—MILLBURY

the Confederate intrenchments during the night, and forming to assault them at daylight. During the night the Confederates succeeded in crossing their men, leaving artillery, cavalry, horses, mules, wagons, camp equipage and private baggage. The Confederate right wing was effectually broken and largely dispersed.

The overthrow of the Confederate right was followed 6 February by the capture by Admiral Foote, acting in co-operation with Gen. Grant, of Fort Henry on the Tennessee, and 16 February by the capture of Fort Donelson, with its artillery and garrison of about 15,000, by Gen. Grant.

On 8 February Gen. Johnston notified the Secretary of War that the loss of Fort Henry and the movement against Fort Donelson made the Bowling Green line untenable, and that he had directed Gen. Hardee at Bowling Green to prepare to fall back on Nashville. The evacuation was completed 14 February, and by the 17th Gen. Hardee had crossed the Cumberland at Nashville and proceeded toward Murfreesboro. Ten days later, all army supplies having been sent to Chattanooga, which place was held by troops sent by Gen. Bragg from Mobile, Johnston's army marched for the line of the Memphis & Charleston Railroad at Decatur, this line having been decided upon as the next for defense.

By the last of March Johnston's column had taken position at Corinth, Bragg's forces had reached him from Mobile, and a portion of Polk's from Columbus.

Meantime (15 February) Bowling Green was occupied by Union forces under O. M. Mitchell. Pressing on, he reached Edgefield opposite Nashville on the 14th. Nelson's division arrived by transports the next day, and soon after the first of March Buell's entire column, coming partly by land and in part by river, was concentrated at Nashville.

The Union movement to Pittsburg Landing began 10 March by the despatch of Gen. W. T. Sherman's division from Paducah up the Tennessee. It proceeded, under orders of Gen. C. F. Smith, to the vicinity of Eastport; but finding all streams inland at flood, the expedition dropped back to Pittsburg Landing, where it found Hurlbut's division. The latter took post 1½ miles back 18 February, and Sherman's the next day about three miles, back, at Shiloh Church. These were followed within a few days by the divisions of Prentiss, McClernand and W. H. H. Wallace, each selecting its own camp without special reference to a general line, the movement being regarded as a concentration preparatory to an advance on Corinth. Gen. Lew Wallace's division was halted at Crump's Landing, five miles below Pittsburg. Gen. Grant arrived and assumed command 17 March, establishing his headquarters at Savannah nine miles below, on the opposite side of the Tennessee.

Gen. Buell's advance left Nashville 15 March to join Gen. Grant at Savannah. After marching 130 miles in nine days he was stopped by high water in Duck River, necessitating bridging, and then marched the remaining 90 miles in six days. Gen. Grant had advised him that it was not necessary to hurry, as he would not be ready to cross his command over the river till 8 April. However, Buell pushed on and fortunately reached Savannah with the head of his column the night of the 5th. Gen. Johnston, with the

design of attacking Grant before Buell could join him, had marched from Corinth 3d April, with the expectation of attacking on the 5th, but heavy rains delayed his columns, and his unexpected attack was delivered soon after daylight of 6 April, thus opening the battle of Shiloh or Pittsburg Landing. See *SHILOH, BATTLE OF*.
H. V. BOYNTON.

Millais, mil-lá', Sir John Everett, English painter: b. Southampton, England, 8 June 1829; d. London 13 Aug. 1896. His earliest years were spent in Jersey and at Dinan in France, and at the age of eight, he was sent to study art under Mr. Sass. In 1840 he became a student in the Royal Academy, and in 1846 he exhibited his 'Pizarro seizing the Inca of Peru.' Next year the gold medal of the Academy was awarded to his 'Young Men of Benjamin seizing their Brides.' In 1848, along with Holman Hunt, Dante G. Rossetti, and others, he founded the Pre-Raphaelite Brotherhood. Among the chief works of this period are 'A Huguenot,' 'The Order of Release,' and the 'Proscribed Royalist.' In 1853 he was elected an associate of the Royal Academy, and ten years later Academician. For a few years thereafter his pictures were still influenced by the Pre-Raphaelite principles, which he gradually shook himself clear of. He developed into a splendid colorist, a master of technique, and altogether a great modern master. Numerous honors fell to him; he was decorated with the Legion of Honor in 1878, elected a member of the Académie des Beaux-Arts in 1882, created a baronet in 1885, and elected to succeed Lord Leighton as President of the Royal Academy in 1896; but he only held this last position about six months, dying on 13 August of the same year. He was most successful in figure-pieces and portraits, but he also produced a certain number of landscapes, one of the finest being 'Chill October' (1871). He painted portraits of some of the foremost men of the day, including Mr. Gladstone, Lord Beaconsfield, Lord Salisbury, Mr. Ruskin, Lord Tennyson, and others.

Millard, mil'ard, Evelyn, English actress: b. London. After a private education, she made her first appearance in 1891 in a stock company at Margate. Among her parts are Polly Fletcher in 'The Lost Paradise'; Princess Flavia in 'The Prisoner of Zenda'; Portia in Beerbohm Tree's production of 'Julius Caesar' in 1898; and Miss Hobbs in J. K. Jerome's comedy of that name.

Millbank Prison, or **The Penitentiary**, a famous London house of detention, demolished in 1891. It was situated in the parish of St. John's, Westminster, facing the Thames, and was erected at an enormous cost to carry out the plans of the philanthropists Howard and Bentham. The building was commenced in 1812, and completed in 1821. It had accommodation for 1,100 prisoners. The prison ceased to be a convict establishment in May 1886.

Millboard, in bookbinding, a pasteboard made of strong materials, used for the stiff portion of book covers. It is also used for packing between the flanges of pipes, being previously soaked in oil.

Millbury, mil'bū-rī, Mass., town in Worcester County; on the Blackstone River, and on the Boston & A. and the New York, N. H. & H. R.R.'s; about five miles southeast of Worcester.

MILLEDGE — MILLENNIUM

It was settled in 1743 and was called North Parish of Sutton until 1813 when it was incorporated. It is claimed as the place where the "Lyceum Lecture System" originated in 1820. It is a manufacturing town; the chief industrial establishments are foundries, machine-shops, linen cloth factory, woolen mills, thread factories, hosiery mills, lumber mills, weaving machinery, and cotton mills. Pop. (1890) 4,428; (1900) 4,460.

Milledge, mil'ej, John, American soldier and politician: b. Savannah, Ga., 1757; d. 9 Feb. 1818. At the outbreak of the Revolution he was one of the party which, led by Joseph Habersham, made a prisoner of Wright, the royal governor, 17 June 1775, the first bold revolutionary act performed in Georgia. When Savannah was taken by the British, Milledge escaped to South Carolina, where he was captured by a party of Americans, and came near being hanged as a spy. In 1779 he was present at the unsuccessful siege of Savannah. He was also at the siege of Augusta, and in South Carolina and Georgia, at various places, did valuable service in the patriot army. In 1780 he was appointed attorney-general of Georgia, and afterward served frequently in the State legislature. In 1802 he was elected governor of Georgia, and served two terms. He was a representative in Congress from 1792 to 1802, except one term, and United States senator from 1806 to 1809. Milledge was the principal founder of the University of Georgia, and purchased and presented a tract of land which is the site of the university and of a part of Athens, its seat. See **MILLEDGEVILLE**.

Milledgeville, mil'ej-vil, Ga., city, county-seat of Baldwin County; on the Oconee River, and on the Georgia and the Central of G. R.R.'s; about 30 miles northeast of Macon. It is near the geographical centre of the State; and streams nearby furnish natural drainage and water-power. The dam on the Oconee increases the water-power. The place was settled in 1803, received its city charter in 1836, and was named in honor of John Milledge (q.v.). From 1807 to 1877 it was the capital of the State. It is in a fertile agricultural region in which cotton, corn, wheat, hay, and fruits are the chief products. In the vicinity are fine deposits of talc, kaolin, and fire-clay. Ornamental and building brick are manufactured extensively and quantities of clay are shipped to other places. The preparation of cotton for the markets is a most important industry. The building which was once the State capitol is now the Georgia Military College, a school which, in 1903, had in attendance 500 students. Other institutions are the Georgia Normal and Industrial College, a State School for Girls, and the State Sanitarium for the Insane. The State Prison farm is just outside the city limits. The government is administered under a charter of 1900 and is vested in a mayor who holds office two years, and a council. The mayor is a member of the council. Pop. (1890) 3,322; (1900) 4,219.

Millenarians. See **MILLENNIUM**.

Millenary Petition, in English history, a petition named from the number of signatures appended to it presented by the Puritans to James I., in 1603. The petitioners desired to be relieved from the use of the sign of the cross in baptism, the ring in the marriage service, con-

fimation, and bowing at the name of Jesus. The petition in reality contained only 750 names, instead of 1,000.

Millennium (Lat. *mille*, 1,000, and *annus*, a year), a period of 1,000 years. Hence it is a term applied to the period during which, according to some, Jesus Christ will return to reign on earth before the end of the world. This pre-millennial appearance of Christ will be signalized by a first or particular resurrection of the just, who are to reign with Him on earth, and by the destruction of Antichrist. Those who hold such views are called millenarians or chiliasts, and their tenet chiliasm (Gr. *Χίλιοι*, 1,000). It is admitted on all sides that these views were, if not general, at least very common in the ancient church. The belief was generally founded on Ps. xc. 4, according to which 1,000 years are before the Lord as one day, compared with the account of the creation as given by Moses. The six days of creation are taken as designating 6,000 years of toil, and the subsequent sabbath as designating 1,000 years of rest and happiness. The millennium was to be the sabbath rest of the new creation of mankind in Christ. Besides these passages, Rev. xxi. 1-6 is especially quoted by chiliasts in support of their views. Chiliasm prevailed chiefly among the Jewish Christians, who retained after their conversion the hope that they would rule over all other nations under a royal Messiah (q.v.). The Ebionites, the Nazarenes, and Cerinthians all advocated it; and Montanus, and the sect which was called after him, regarded it as a fundamental doctrine of the Christian religion. Some early fathers of the church also declared themselves generally in favor of the doctrine; Papias, Irenæus, and Tertullian were chiliasts; and Papias appealed in support of his view to apostolic traditions. On the other hand, however, the epistles of Clement of Rome and Ignatius of Antioch, are silent about it. Justin Martyr who wrote in the second century was a believer in the millennium. "I and all Christians whose belief is in every respect correct," he says, "know that there will be both a resurrection of the flesh and a thousand years in Jerusalem, which will then be rebuilt, adorned and enlarged, as the prophets Ezekiel, Isaiah and others declare." This view was opposed by the whole Alexandrian school, especially by Origen, who believed in a spiritual supramundane interpretation of Revelations. Still it continued to find advocates during the 3d century, among whom Tertullian, Nepos, bishop of Arsinoe, and Methodius, bishop of Tyre, were prominent. In the 4th century, Jerome, who did not believe in it himself, did not dare to condemn it, in consideration of the many pious and learned advocates it had found in former centuries. Soon after it began to die out; it was temporarily revived toward the close of the 10th century, by the popular belief in the approaching end of the world, but it never regained great strength. The reformation of the 16th century gave a new impulse to chiliasm. Fanatical opinion identified the pope with Antichrist, and regarded the anticipated downfall of the Roman Catholic Church as foreshadowing the approach of the millennium. But when the Anabaptists undertook in 1534 to erect the new Zion, both the Lutheran and Reformed churches declared themselves against this reversion of the old doctrine. Yet it was preached by many

sectarians and theologians of the 16th and 17th centuries, among whom were Weigel and the Moravian bishop Comenius in Germany, Jurieu in France, the Labadists in the Netherlands, and Joseph Mede and Jane Lead (died 1704) in England. A third period in the history of chiliasm may be commenced with the writings of the esteemed exegete and New Testament commentator, Johann Albrecht Bengel. He practically reintroduced it into Protestant theology, where it has ever since been advocated by a number of prominent theologians. The ingenious prelate Oetinger (d. 1782) brought it into connection with his favorite theosophic views. Hahn (the founder of a pietistic sect in Württemberg), Stilling, Lavater, and Hass gave it a wide circulation among the lower classes of the people in Germany and Switzerland. In opposition to the "spiritualism" of modern exegesis, it was advocated, with exegetical arguments, by Hoffmann, Delitzsch, Kurtz, Hebart, and others; while Thiersch, Nitzsch, P. Lange, and Ebrard supported it from a dogmatical as well as an exegetical standpoint. Swedenborg taught that the last judgment took place in 1757, and that the New Church or church of the New Jerusalem had actually been formed both in heaven and on earth. After Germany, England and America have been the chief fields of modern chiliasm. The "Catholic Apostolic Church," organized by Edward Irving, laid great stress on the belief that the kingdom of glory was very near. Chiliasm lies at the foundation of Mormonism, whose adherents call themselves "Latter Day Saints" in reference to the near approach of the last day. In the United States great excitement was caused by the preaching of William Miller (q.v.), who sought to prove from the Scriptures that the second advent of Christ would take place about 1843. He not only met with numerous chiliasmists in most denominations, but he also founded the sect of Adventists (q.v.). Chiliasm has been seriously taken in declarations of doctrine formulated by several churches. The Augsburg Confession implicitly repudiates it, speaking of "the last days foreshown in Holy Scripture, in which the world is to become ever more and more degenerate and mankind more sinful and weak." The Council of Trent declares that "the Scriptures also inform us that the General Judgment shall be preceded by the preaching of the Gospel throughout the world, a defection from the faith and the coming of Antichrist." There is a sort of millennium also looked forward to by those who disbelieve in religion as the renovator of the world. According to these teachers there is a material millennium quite within the range of future possibilities. They teach that the race must look to its renewal and improvement by the non-propagation of disease and impotency of every nature, and to the persistent and joyous multiplication of the best elements of our race, in a continual progress toward the Hierarchy of Life. The millennium, according to this newly invented philosophy, will come by natural and not supernatural means.

Consult: Luthardt, 'Lehre von den letzten Dingen' (1870); Seiss, 'The Last Times' (1878); Salmond, 'Christian Doctrine of Immortality' (1897); Terry, 'Biblical Apocalypics' (1898). See ESCHATOLOGY; JUDGMENT, FINAL; RESURRECTION.

Millepede, a myriapod of the *Chilognatha*, the second order of the class *Myriapoda*, in

which each segment of the body, except a few of the front joints, bears two pairs of legs—the joints in the nearly-related centipedes (q.v.) bearing each one pair only. The common species (genus *Julus*) are found in damp places, concealed under stones, or under the bark of trees. The body consists of from forty to fifty joints, protected by a horny skin, and when irritated or at rest, these animals coil up for protection. The mouth is provided with a pair of strong jaws or "mandibles"; and the antennæ or feelers consist of six or seven joints. The sexual orifices open at the base of the seventh pair of legs in the male; and in the female in the neighborhood of the head. No metamorphosis occurs in these forms, but successive moltings of the skin take place during the period of early growth. See MYRIAPODA.

Millepore, family (*Milleporidæ*) of *Hydrozoa*, remarkable for secreting massive calcareous skeletons like corals, with which they were for a long time classed. The name refers to the multitude of minute orifices which appear on the surface of the skeleton, or "coral," and which are occupied in life by the polyps or hydranths. The hydranths are of two kinds: gastrozooids, or feeding polyps, which provide nourishment for the colony, and dactylozooids, which are elongated, mouthless, protective polyps provided with large numbers of nematocysts (q.v.). The generative cells are remarkable for their wanderings through the tissues of the polyps and colonies. Development takes place in the canals, but little is known of the detailed life-history of millepores, and a medusa stage has been described for only one species. The colonies are hermaphrodite, but the related family *Stylasteridæ* has unisexual colonies. The distribution and habits of the millepores are much like those of the corals. They live in warm seas and form reefs in shallow waters. *Millepora alcornis* is abundant near low water in the West Indies, where representatives of the *Stylasteridæ* also occur in deep water.

Miller, Anna Jenness, American author and lecturer: b. New Hampshire. She is most widely known as an advocate of correct principles of physical development and dress for women; she is also interested in the æsthetic side of life, and is a student of art and a collector of paintings and curios. She was for many years editor and proprietor of the 'Jenness Miller Monthly,' in which she advocated her views; and has given over 1,000 lectures in the United States and Canada on physical culture and dress. She has also designed a costume for women which she claims fulfils the requirements of both hygiene and art. She has published 'Barbara Thayer' (1884); 'Twixt Love and Law'; 'Mother and Babe' (1892); 'How to Finish and Furnish a Home' (1892); 'Creating a Home' (1896); 'Physical Beauty'; and 'Philosopher of Driftwood.'

Miller, Alfred Jacob, American painter: b. Baltimore, Md., 1810; d. 1874. He studied under Thomas Sully, and in Europe, where he made successful copies of the old masters. Accompanying Sir William Drummond Stewart to the Rocky Mountains, he painted many striking pictures of the scenery, which are now in Murthley Castle, Scotland. He also executed numerous portraits.

MILLER

Miller, Charles Henry, American landscape painter: b. New York 20 March 1842. He was educated in medicine at the New York Homœopathic College and subsequently studied art at the Royal Academy of Bavaria in Munich. In 1873 he became an associate of the National Academy of Design and an Academician in 1875. He is especially noted for his studies of Long Island scenery and has exhibited at very many important national and international exhibitions. Among his works may be cited 'Autumn at Creedmoor Oaks'; 'A Grey Day on Long Island'; 'Moonlight near Great South Bay'; 'Long Island Meadows'; 'A Frosty Day on Long Island'; 'The Springfield Mill Pond.' He has published under the signature of 'Carl de Muldor,' 'The Philosophy of Art in America' (1885).

Miller, Charles Ransom, American journalist: b. Hanover, N. H., 17 Jan. 1849. He was graduated from Dartmouth College in 1872 and became a journalist. In 1872-5 he was with the *Springfield Republican* and since then has been on the staff of the *New York Times*, where he was editorial writer in 1881-3 and is now editor-in-chief.

Miller, Cincinnatus Heine, better known as "JOAQUIN MILLER," American poet, whose pseudonym is due to his defense of Joaquin Murietta, a Mexican bandit: b. Wabash district, Ind., 10 Nov. 1841. His father took him to Oregon in 1854. He got a little schooling but soon ran away from home; went to the California gold mines; accompanied Walker on the Nicaragua filibustering expedition; lived familiarly among the Indians and the Spaniards of the Pacific slope; studied law for a few years, having graduated at Columbia College, Oregon, in 1858; practised law unsuccessfully in Idaho, where he soon turned express messenger, and in 1863 settled in Oregon for a short time, becoming editor of the *Eugene City Democratic Register*, which was suppressed in the same year because of its treasonable character. In 1864 he began to practise law in Cañon City, Ore., made himself popular by his services against the warlike Snake Indians, and from 1866 to 1870 was judge of Grant County. His writings collected under the title 'Songs of the Sierras' he could not sell in the East, and so took them to London, where they were published and brought him great fame. He visited London again in 1873; lived in Washington, D. C.; and in 1887 returned to California, settling near Oakland. His life sums up the adventure of the Pacific slope, and his verse and fiction are to be prized especially on this account as being real "documents" of certain phases of American life. They are, moreover, fresh, vigorous, and original in style; his metre is free and powerful; and his narrative forcible. He excels, perhaps, in his pictures of Nature. In a few short lyrics there is a quiet melancholy, bred of communion with solitary wood and mountain. But on the whole he is not a great artist, although his work has a distinct value as descriptive of various American types. Hence his fame has been much greater in England, where he was even styled "the American Byron," than in America. Miller's verse includes: 'Songs of the Sunlands' (1873); 'Songs of the Desert' (1875); 'Songs of Italy' (1878); 'Collected Poems' (1882); and 'Songs of Mexican Seas' (1887). His

prose works are: 'The Baroness of New York' (1877); 'The Danites in the Sierras' (1881; later in the form of a play); and '49, or the Gold-Seekers of the Sierras' (1884).

Miller, Emily Huntington, American author and educator: b. Brooklyn, Conn., 22 Oct. 1833. She was graduated from Oberlin College, Ohio, in 1857, and was married to J. E. Miller (d. 1882) in 1860. She was editor of a juvenile magazine, 'The Little Corporal,' afterward merged in 'St. Nicholas,' and in 1891-8 was dean of the Woman's College of Northwestern University. She has written: 'From Avalon and Other Poems' (1896); 'Fighting the Enemy'; 'Helps and Hindrances'; 'Songs from the Just'; etc.

Miller, Florence Fenwick, English doctor, lecturer and author: b. 5 Nov. 1854. She entered the Ladies' Medical College, London, in 1871; gained a wide practice and did much charity work; was thrice a member of the London school board; and is a prominent advocate of women's suffrage. She married Frederick A. Ford in 1877, but kept her maiden name. She wrote: 'The House of Life' (1879); 'Physiology for Schools' (1880); 'Atlas of Anatomy' (1880); 'Readings in Social Economy' (1883); 'Life of Harriet Martineau' (1884); and 'In Ladies' Company' (1892), as well as letters over the signature "Filomena" for the *London News* and for various provincial papers.

Miller, Harriet Mann ("OLIVE THORNE MILLER"), American ornithological writer: b. Auburn, N. Y., 25 June 1831. Her earliest writings were signed "Olive Thorne," and after her marriage to W. T. Miller in 1849 she added her husband's name to her signature. She began her study of birds in 1880 and has published for young people's reading: 'Little Folks in Feathers and Fur' (1879); 'Little People of Asia' (1882); 'In Nesting Time' (1888); 'Little Brothers of the Air' (1892); 'A Bird-Lover in the West' (1894); 'Our Home Pets' (1894); 'Four Handed Folk' (1896); 'Under the Tree Tops' (1897); 'The First Book of Birds' (1899); etc.

Miller, Hugh, Scottish geologist and author: b. Cromarty 10 Oct. 1802; d. Portobello, near Edinburgh, 23 Dec. 1856. When five years old he lost his father, a seaman, and thus came under the care of his mother and her two brothers, who were unable to keep him in school, so fond was he of out-door life, of unrestrained reading, and of composition. That he might have the winter months free to write in, it is said, he became a stonemason. At this trade he worked from 1819 to 1834; gained some literary repute in the meantime, especially by letters to the 'Inverness Courier' on the herring fishery; in 1834 became accountant in the bank at Cromarty; wrote 'Scenes and Legends of the North of Scotland' (1836); and gradually became known for his knowledge of geology, to which he had first been drawn by noting the ripple marks on a block he was handling in the stonemasons' yard. 'Old Red Sandstone or New Walks in Old Fields' (1842) made Miller famous, and the Old Red Sandstone became freshly important to the geologist. Miller was a devout Christian, a promoter of the "Free Church," and intensely orthodox in his

MILLER

opinions. Hence he opposed the doctrine of development advanced in the anonymous 'Vestiges of Creation,' and in 1847 published 'Footprints of the Creator,' to which 'The Testimony of the Rocks' (1857) formed a sort of sequel. In these books Miller held that, while the Bible is not a scientific text-book and should not be so regarded, yet it is not contradicted by science. In particular he urged that the narrative of a six-day creation was entirely consonant with modern geological discovery; indeed he divided into six eras, to correspond with these six "days," all of geological history. His interest in the Free Church movement prompted him in 1839 to write 'A Letter to Lord Brougham' and 'The Whiggism of the Old School,' in which he protested against forcing clergy on the Scotch churches. Both pamphlets were so forceful that their author in 1840 was made editor of the 'Witness,' an Edinburgh bi-weekly devoted to ecclesiastical independence. This post he held for nearly 17 years, while his health gradually broke under the stonemason's disease contracted years before; at the same time his mind suddenly failed, and in a moment of aberration he shot himself. Miller's present vogue is due to his admirable, simple and fascinating style. As a scientist he did, it is true, urge the doctrine of specific creation, and emphasize the complete definiteness of demarcation between strata of various geological series and the catastrophic nature of the change from one era to another; but these views were not reactionary at the time, being held by other scientists with far wider and deeper training than Miller. His common sense and native sagacity led him to the correct solution of many minor concrete problems in geology; and his books popularized the study of that science. Consult: Miller's famous autobiography, 'My Schools and Schoolmasters' (1852); Bayne, 'Life and Letters of Hugh Miller' (1871); a memoir by Agassiz in the later American editions of 'Footprints of the Creator'; and Brown, 'Labour and Triumph' (1858).

Miller, James, American soldier and politician: b. Peterboro, N. H., 25 April 1776; d. Temple, N. H., 7 July 1851. He was educated for the bar, but entered the army as major in 1808, and distinguished himself on the northern frontier. In 1812 he was brevetted colonel for gallantry as commander at Brownstown, and in the following year participated with credit in the capture of Fort George. In 1814, as colonel of the 21st infantry, he accompanied the invading army into Canada, and fought with gallantry at the battles of Chippewa and Lundy's Lane (qq.v.), the success of the Americans in the latter conflict being mainly due to his capture of a British battery. For these services he was made brigadier-general, and received from Congress a gold medal. In 1819 he resigned his commission in the army, and from that year until 1825 served as governor of the Territory of Arkansas. He was collector of the port of Salem, Mass., from 1825 to 1849, when he retired to private life.

Miller, James Russell, American Presbyterian clergyman and author: b. Harshaville, Pa., 20 March 1840. He was graduated from Westminster College, New Wilmington, Pa., in 1862 and has held several important pastorates.

He is editor of the Presbyterian Board of Publication and among his very numerous books are: 'Week-Day Religion' (1880); 'The Marriage Altar' (1888); 'Building of Character' (1894); 'To-day and To-morrow' (1902); 'In Perfect Peace' (1902); etc.

Miller, Joaquin. See **MILLER, CININNATUS HEINE**.

Miller, John Franklin, American soldier: b. South Bend, Ind., 21 Nov. 1831; d. Washington, D. C., 8 March 1886. He was graduated from the New York State Law School in 1852 and established a practice at South Bend, and took a leading part in State politics. In 1860 he was elected State senator, but resigned to enter the army the next year. He was in active service from almost the beginning, and in the battle at Stone River he performed services which led to his promotion to the rank of brigadier-general. He resigned at the close of the war though offered a commission as colonel in the regular army, and removed to California, where he for a time practised law and then entered a business life. He continued an active interest in politics, and from 1881 until his death was United States Senator.

Miller, Joseph. See **JOE MILLER**.

Miller, Joseph Nelson, American naval officer: b. Ohio 22 Nov. 1836. He entered the navy in 1851, and at the time of the outbreak of the Civil War held the rank of lieutenant, and was promoted lieutenant commander in 1862. As executive officer of the Passaic he had part in the attack upon Fort McAllister and Fort Sumter, and in the two attacks upon Fort Fisher as executive officer of the Monadnock; and received commendation from his commanding officers for bravery and skill in these engagements. In 1870 he was promoted to the rank of commander, and in 1875 was assigned to the Tuscarora, and had charge of the deep sea soundings between the Hawaiian and the Fiji Islands. He obtained the rank of captain in 1881, commodore in 1894, and rear-admiral in 1897. In the latter year as commander-in-chief of the Pacific stations he hoisted the American flag at Honolulu, and in 1898 again raised the flag there, when American sovereignty of Hawaii was established. In 1897 he was the representative of the United States Navy at Queen Victoria's Jubilee, with the Brooklyn as flagship; and during the Spanish War (1898) he organized the naval reserves on the Pacific coast. He was retired from active service in November 1898.

Miller, Lewis, American inventor and philanthropist: b. Greentown, Ohio, 1829; d. New York 17 Feb. 1899. He was a machinist, settled at Canton, Ohio, where he made agricultural tools, many of them after his own designs, notably the first successful reapers and binders; and later had factories at Akron and Mansfield. In Akron he built a model Sunday School, and he gave much money for Sunday School work throughout the country. He planned the Chautauqua Assembly and was its president from 1874 until his death.

Miller, Merrill, American naval officer: b. Ohio. He was appointed to the United States Naval Academy in 1850 and upon the outbreak of the Civil War was assigned to active duty. He was in the Mississippi squad-

MILLER—MILLERAND

ron in 1862-3, was at the battles of Arkansas Post, Haines' Bluff, the siege of Vicksburg, and in 1864-5 was with the North Atlantic squadron. He continued in the navy after the war in different stations, was promoted captain in 1893, and since 1897 has been in command of United States receiving-ship Vermont.

Miller, Olive Thorne. See MILLER, HARRIET (MANN).

Miller, Patrick, Scottish pioneer in steam navigation: b. Glasgow 1731; d. Dalswinton, Dumfriesshire, 9 Dec. 1815. He was engaged in business as a banker in Edinburgh, and was a leading stockholder in the Carron Iron Company, in whose shops carronades were first manufactured and from which they derived their name. In 1785 he purchased the estate of Dalswinton in Dumfriesshire, and here spent the latter part of his life, devoting his attention to agriculture (he introduced forin grass, or white bent, into Scotland, and wrote a treatise on it), and to experiments in ship-building. On 14 Oct. 1788 he first demonstrated the possibility of steam navigation by sailing a steam-propelled boat, 25 feet long and 7 broad, on the lake near his house. Miller had Robert Burns at one time as his tenant and correspondent. Consult: Woodcroft, 'Steam Navigation' (1848).

Miller, Warner, American manufacturer and politician: b. Oswego County, N. Y., 12 Aug. 1838. He was graduated from Union College in 1860; and for a year was professor of Greek and Latin at the Fort Edward Collegiate Institute. In the Civil War he served in the Fifth New York cavalry, enlisting as a private, and attaining the rank of lieutenant; he fought under Sheridan, and was taken prisoner at the battle of Winchester, was paroled on the field, and afterward honorably discharged. After the war he established a paper manufacturing business, in which he has continued to hold large interests. He has also been an active member of the Republican party, was delegate to the National Convention in 1872, and was elected to the New York legislature in 1874; and was a member of Congress from 1879 to 1881. In 1881, when T. C. Platt (q.v.) resigned from the United States Senate, Miller was elected to fill the vacancy, serving as Senator till 1887; in 1888 he was nominated for governor of New York by the Republicans, but failed of election. Later he has been interested in the Nicaragua Canal project, and was president of the Nicaragua Canal Company.

Miller, William, American religious leader: b. Pittsfield, Mass., 5 Feb. 1782; d. Low Hampton, Washington County, N. Y., 20 Dec. 1849. Most of his education he obtained through books procured by wood-chopping. He became a farmer at Poultny, Vt., in 1803, and in 1816 removed to Low Hampton, N. Y. In the War of 1812 he was captain of a company organized to protect the northern frontier. He was at first a student of Hume, Voltaire, Thomas Paine, and Ethan Allen, and an avowed deist; but afterward became a member of the Baptist Church at Low Hampton. After a prolonged study of the Bible, enlightened by no help excepting that of a concordance, he began in 1831 to preach the second advent of Christ. He was licensed as a preacher by the Church at Low Hampton, but was never

ordained. For a time all pulpits except the Roman Catholic and Episcopalian welcomed him. He first set the time of the second coming as somewhere between 21 March 1843 and 21 March 1844, and on 14 March 1844 proclaimed it as near at hand. Months intervened, and then, in October, the faithful gathered in their assemblies. At the end of November they dispersed. Many of the Second Adventists, or Millerites, as they were sometimes called, affiliated with other sects, but about 50,000 remained under the direction of Miller, who, on 25 April 1845, called a convention by which a declaration of faith was adopted, and the name of "Adventist" selected for the sect, which increased in numbers, and is to-day divided among six branches. Miller assisted in establishing, in 1840, 'The Signs of the Times and Exposition of Prophecy,' later called the 'Advent Herald.' He published 'Evidence from Scripture and History of the Second Coming of Christ about the Year 1843' in a Course of Lectures' (1842); a widely circulated 'Dream of the Last Day,' and other writings. Consult the biographies by Bliss (1853) and White (1875). See ADVENTISTS; MILLENNIUM.

Miller, William, English line engraver: b. Edinburgh 28 May 1796; d. Sheffield 20 Jan. 1882. He was educated in England and at the University of Edinburgh, and studied engraving at Edinburgh and also under George Cooke during a residence in London, after which he returned and settled in his native city. His work was much commended by R. W. Turner, and he engraved many plates after and in accordance with the suggestions of that painter. Of these the most important are: 'The Bass Rock in a Storm' (1826); 'Great Yarmouth' (1829); 'The Grand Canal, Venice' (1837); 'Modern Italy' (1839); 'The Bell Rock Lighthouse in a Storm' (1864); 'St. Michael's Mount' (1866). The chief features in his engravings are the remarkable skill with which he gives the tone and value of color effects in black and white; the boldness and freedom with the line is employed in expressing the movement and gloom of storm clouds, the transparent fluidity of tossing waves, and the glassy surface of still rivers.

Miller, William, Scottish poet: b. Bridgegate, Glasgow, August 1810; d. Glasgow 20 Aug. 1872. Uncertain health preventing his becoming a physician, he adopted the trade of wood-turning. He published 'Scottish Nursery Songs and Other Poems' (1863). One of his most popular poems is 'Wee Willie Winkie.'

Miller, William Henry Harrison, American jurist: b. Augusta, N. Y., 6 Sept. 1840. He was graduated from Hamilton College, Clinton, N. Y., in 1861 and in 1862 entered the army, serving through the war. He engaged in law practice in Fort Wayne, Ind., 1866-74; in 1874 removed to Indianapolis and formed a partnership with Benjamin Harrison, and under the latter's administration (1889-93) was attorney-general of the United States.

Miller, Fort, a former fortification on the site of the present village of Fort Miller, Washington County, N. Y.; on the Hudson River, 40 miles north of Albany.

Millerand, mèl-è-rân, Alexander, French Socialist: b. Paris 10 Feb. 1859. He was edu-

MILLER'S TALE OF THE CARPENTER — MILLET

cated at the Lycée Vanves and the Lycée Henri IV., was admitted to the bar in 1881, and in 1885 was elected to the Chamber of Deputies as a radical Socialist. Frequently re-elected, he became a leader of the parliamentary or opportunist Socialists, and in 1899 received the portfolio of commerce in the Waldeck-Rousseau cabinet. In this post he secured the passage of important laws for the benefit of workmen. He became proprietor (1889) of *La Voix*, which journal he made largely a vehicle for his own opinions.

Miller's Tale of the Carpenter, The, one of Chaucer's 'Canterbury Tales' (1475). The source of the tale is unknown.

Miller's-thumb, the English name for a small spiny fresh-water goby (*Cottus gobio*), of which many species occur in Europe and elsewhere. They are frequently called "bullheads" (q.v.), but are different from the small American catfish so called.

Millersburg, mil'érz-bérg, Ohio, village, county-seat of Holmes County; on Killbuck Creek, and on the Cleveland, A. & C. railroad; about 70 miles northeast of Columbus. It is a manufacturing village; its principal industrial establishments are flour and lumber mills, foundry, brick-yards, and machine-shops. In the vicinity are deposits of iron ore and bituminous coal. Pop. (1890) 1,923; (1900) 1,998.

Millet, Aimé, ä-mä mē-lä, French sculptor: b. Paris 1816; d. there 14 Jan. 1891. He studied art under David d'Angers (see DAVID, PIERRE JEAN), and the architect Viollet-le-Duc (q.v.), applied himself first to painting, and exhibited a picture in the exhibition of 1842, toiling at the easel for 10 years with no success. He meanwhile had turned his attention to the plastic arts, and exhibited his first statue, a 'Bacchante,' in 1845. This was followed by his 'Ariadne,' now in the Luxembourg, a 'Mercury' and a statue of 'Civic Justice' for the mairie of the First Arrondissement, Paris; the statue of a 'Young Girl' for a monument in the cemetery of Montmartre, an 'Apollo' for the façade of the New Opera House, and a bronze statue of 'Vercingetorix' (1865). Among his portrait and personal works are the statues of Chateaubriand at St. Malo; of Denis Papin, at Blois; and numerous busts. His style has all the realism of modern French sculpture, combined with a certain theatrical demonstrativeness, a vividness of expression, pathetic, tragic or passionate. Consult Dumesnil, 'Aimé Millet, Souvenirs Intimes' (1891).

Millet, Francis Davis, American artist: b. Mattapoiset, Mass., 3 Nov. 1846. He was graduated at Harvard 1869, served in the Civil War, and subsequently studied at the Royal Academy of Antwerp (1871-2). He became member of the National Academy of Design (1885). He designed the decorations of Trinity Church, Boston, and those in many important buildings in New York, Chicago, and elsewhere. Among his best known paintings are: 'At the Inn' (Union League Club); 'A Cosy Corner' (Metropolitan Museum of Art); and 'Between Two Fires' (National Gallery of British Art, London). He served as newspaper correspondent for the *London Times* and 'Harper's Weekly' at Manila (1898); and has translated Tolstoi's 'Sebastopol.'

Millet, Jean François, zhôn frân-swä mē-lä, French painter: b. Gruchy, near Cherbourg, 4 Oct. 1814; d. Barbizon 20 Jan. 1874. He was educated in the Academy of Design at Cherbourg, and received a bursary from that city which enabled him, in 1837, to proceed to Paris, where he entered the studio of Delaroche. This does not seem to have been a congenial home for his early art life, yet at first he struggled to comply with his surroundings and painted genres in the style of Watteau (q.v.) and Boucher (see BOUCHER, FRANÇOIS), as well as Biblical and mythological incidents, with landscape backgrounds. It was in 1848 that he really found himself, and hit upon the line of art in which he could give utterance to the sincere feelings of his heart. This turning point in his career was marked by the appearance of his genre painting, taken from country life, 'The Winnower.' Henceforth his days were to be spent far from the glitter of Paris, the competition and jealousies of the studios; settling in Barbizon, on the edge of the forest of Fontainebleau, he devoted himself to the study and portrayal of peasant life. The hardship, toil and privation of the farm laborers he sympathized with acutely, and some have even accused him of being a social revolutionist, but he professed no views of this tendency, though his interpretation of the peasant's lot may be too gloomy and pessimistic, and his ironical bitterness of spirit such that it infected his canvas and clouded the beauty of external nature as depicted there. He himself was almost all his life battling with that poverty whose privations had early robbed him of his young wife. There is a profound pathos in his conception of the rural isolation and hardship of soil slavery, with all its stolid but unrequited patience, and this he has portrayed with a certain broad and impressionistic treatment which is both sincere and original. At first, his works were passed by or misunderstood, but gradually they were recognized at their true value, and he was hailed as the greatest painter of modern France. Since his death his pictures have been sold at enormous prices and are looked upon as the most precious pieces in private or public collections. His greatest picture, the 'Angelus' (1859), was bought at auction for \$32,000. Millet himself sold his picture 'The Woman with the Lamp' for \$2,800 in 1872. Shortly after it was sold for \$4,600, and again for \$7,000. In 1882 it fetched \$18,000. The most important of his other works are: 'The Sower' (1850); 'Man Spreading Manure' (1852); 'The Reapers' (1853); 'The Gleaners' (1857, in the Louvre); 'Death and the Woodcutter'; 'La Becquée' (Feeding Her Birds)—a mother feeding her three children from the same bowl. These all belong to his early period when he was tortured with sickness and harassed by debt. After the appearance of the 'Angelus' his reputation was established and he had reached smooth waters. In 1860 he produced his wonderful picture, the 'Sheep-Shearing,' in which he seems to express as much pity for the dumb beast as for the patience of the human toiler who is bent over it. In 1862 appeared the 'Potato Planters'; in 1863 'The Wool Carder,' and 'The Man with the Hoe.' In 1867 he was awarded at the Paris Exposition a medal of the 1st class. He took refuge in Cherbourg during the Franco-Prussian war, but returned to Barbizon in 1871, where he con-

MILLET — MILLIKEN'S BEND

tinued in broken health, though still working with untiring brush, until the end came.

Among the paintings of this artist now in the United States are: 'The Sower'; 'The Water Carrier' (Vanderbilt collection); 'A Peasant Grafting a Tree' (Rockefeller collection); 'The Turkey Tender' (C. A. Dana collection); 'The Buckwheat Threshers' and the 'Potato Planters' (Quincy Shaw collection); 'The Churners' (F. L. Ames collection); 'Potato Diggers' and 'Breaking Flax' (Walters collection).

The drawings, etchings, and pastels of Millet are eagerly sought after and always bring a high price at auctions or private sale. The most familiar is his own portrait, a sketch often reproduced. His 'Woman Feeding Chickens'; 'Flock of Sheep with Shepherd'; the 'Newborn Lamb'; 'Laundresses on the Shore' are best known. Among his pastels are 'The Vine Dresser' and 'Butter Making.' All his works show masterly drawing, and the landscapes which appear in many of them are put in with an ease and atmosphere worthy of the best periods of French art. His coloring may be sombre, and he disregards the power of the human countenance as giving expression to the sentiment of his conception. But the life of each picture is to be found in the inimitable pose of the figures, and the suggestiveness of the background. The hands, shoulders, and feet of these figures, as they move in harmony with forms cumbrous, almost grotesque, are made to suggest the dull torture in which stolid and half bestial creatures are held under the yoke of toil and poverty. The light reflected upon these figures from religious sentiment or natural affection only serves to intensify the profound melancholy by which the story of their lives is clouded.

Consult: Sensier, 'La Vie et l'Œuvre de Jean François Millet' (1881); and its abridged English translation, Boston (1896).

Millet, a popular name for many grasses grown in the Old World as cereals, but in the New almost wholly as forage. The principal ones are: True or broomcorn millet (*Panicum milaccum*); foxtail millet (*Setaria italica*); barnyard or Japanese (*Panicum crus-galli*); pearl or cat-tail millet (*Pennisetum typhoidum*), and the African, Chinese, Indian, black and erroneously-called "pearl millet" (*Sorghum vulgare*). Sometimes *Elusine coracana* is called African millet. In general they constitute one of the most important groups of food-plants, since they are the staple diet of about one third of the world's population, the annual plantation in India alone being estimated at approximately 35,000,000 acres. The first three mentioned are the most important groups grown in the United States. The plants all thrive well upon rather light, well-drained soils, which should be prepared as for other cereal crops. In order to make a millet harvest succeed the harvest of other cereals, the seed is sown late in the spring. Broadcasting and drilling are both practised, the latter more extensively. Just after blossoming, the crop may be cut and cured for hay; for seed, just before the seed becomes fully mature to prevent loss from shattering. The hay makes valuable fodder, but some stockmen attribute various animal ailments to its excessive or exclusive use; others experience no such difficulties. The seed may be ground for stock food, but it is little used. For poultry, especially for young chicks, it is widely employed. Consult:

Farmers' Bulletin No. 101, United States Department of Agriculture, and the 'Year Book' of the Department for 1898. See GRASSES IN THE UNITED STATES.

Milligan, mil'i-gan, William, Scottish Presbyterian clergyman and commentator: b. Edinburgh 15 March 1821; d. Aberdeen 11 Dec. 1893. He was educated at the University of St. Andrews, entered the ministry of the Established Church of Scotland, held pastorates at Cameron and Kilconquhar, and was professor of Biblical criticism in the University of Aberdeen from 1860. He was one of the revisers of the New Testament and the author of 'The Higher Education of Women' (1878); 'Commentary on the Revelation' (1883); 'The Resurrection of the Dead' (1890); etc. He visited the United States in 1872 as a delegate to the Presbyterian General Assembly from the General Assembly of the Scottish Church.

Milligan College, in Milligan, Tenn.; a coeducational institution founded in 1882 under the auspices of the Disciples of Christ. It has a preparatory department and a college department; the courses lead to the degrees of A.B., B.S., and Ph.B. In 1903 there were connected with the school 11 professors and over 200 students. The library contained about 3,000 volumes. The grounds and buildings were valued at \$16,300, and the income was about \$4,000.

Milligan Decision, The, an important ruling of the United States Supreme Court in 1866. In 1864 an Indiana man named Milligan was arrested by a United States officer on charges of conspiracy, inciting insurrection, and giving aid to the enemy. He was tried by a military commission, found guilty, and sentenced to be hanged. His counsel filed in the circuit court a petition for a writ of habeas corpus, claiming that the plaintiff was a civilian in no way connected with the military service, and that he was not in a rebel State. The case was carried to the Supreme Court, where it was held that a military commission organized during the war in a State not invaded or in rebellion, and where the Federal courts were open and unobstructed, had no jurisdiction to try, convict or sentence for a criminal offense a citizen who was neither a resident of a State in rebellion nor a prisoner of war.

Milligram, the thousandth part of a gram. See WEIGHTS AND MEASURES.

Milliken's Bend, Engagement at. Milliken's Bend, La., on the west bank of the Mississippi, about 15 miles above Vicksburg, was the base of some of the military operations against that place and the lower Mississippi. Early in June 1863, when Grant was besieging Vicksburg from the east, Gen. E. Kirby Smith, commanding the Confederate department of the Trans-Mississippi, sent Gen. J. G. Walker's division of 4,000 men to seize the place and other points on the river, and open communication with General Pemberton, in Vicksburg, with the object of furnishing him supplies, or, failing in that, to cover his escape across the river. Walker moved to Alexandria, La., and reported to Gen. R. Taylor, commanding in West Louisiana, and was sent in transports up the Washita and Tensas rivers, until abreast of Vicksburg, when he landed and marched across to Richmond. At this time Milliken's Bend was held by Gen. E. S. Dennis,

MILLILITRE — MILLS

with about 1,400 men, all but less than 200 of whom were inexperienced colored troops. Dennis had heard of the movement toward Richmond, and 6 June sent Col. Lieb, with a regiment of colored troops and about 100 of the 10th Illinois cavalry, to reconnoitre, and when within three miles of Richmond Lieb encountered Harrison's Confederate cavalry and fell back, followed by the Confederates, who charged his cavalry, driving it in some disorder, but were checked by Lieb's infantry. Walker arrived at Richmond at 10 A.M. of the 6th, and was ordered by Taylor to send one brigade to Young's Point and one to Milliken's Bend, distant respectively 20 and 10 miles, and to hold a third brigade in reserve six miles in advance of Richmond. Harris' brigade moved at night on Young's Point, was delayed, and accomplished nothing. Gen. H. E. McCulloch, with a Texas brigade of 1,600 men and 200 cavalry, marched from Richmond at 6 P.M. of the 6th, and at 3 A.M. of the 7th, when, within one and a half miles of Milliken's Bend, the Union skirmishers were encountered and the Confederate advance driven back in some disorder; but McCulloch rallied his men and pushed on, driving the Union troops back slowly to their main line, which was covered by thick hedges. These were passed with much difficulty under severe fire, and McCulloch ordered an assault, instantly carrying the Union breastworks and engaging the colored troops hand to hand with the bayonet and clubbed muskets. In this encounter many were killed and wounded on each side, and the Union troops were finally driven back to the bank of the river, where they kept up a continuous fire until near noon, when two gunboats came to their assistance and, pouring shells into the ranks of the Confederates, obliged them to withdraw and return to Richmond. The Union loss was 127 killed, 287 wounded, and 266 missing; the Confederates lost 44 killed, 131 wounded, and 10 missing. Consult 'Official Records,' Vol. XXIV.

E. A. CARMAN.

Millilitre, mil'li-lē-tur, a French measure of capacity, containing the thousandth part of a litre. See WEIGHTS AND MEASURES.

Millimetre, a French lineal measure equal to the thousandth part of a metre. See WEIGHTS AND MEASURES.

Mills, John, American military engineer: b. Wheatland, Mich., 31 Dec. 1858. He was graduated from West Point in 1881 and served in the engineering corps until 1883, after which he performed various engineering duties under the government, and in 1894-8 was chief-engineer of the United States Lighthouse Board at Washington. In 1898-1900 he was on duty with the engineers' battalion at Willet's Point, N. Y., and in Cuba. He was sent as delegate to various engineering conferences in Paris in 1900, and visited Egypt on inspecting duty. Since 1900 he has been on duty at Puget Sound, engaged in river and harbor improvements and fortifications.

Mills, Albert Leopold, American military officer: b. New York city 7 May 1854. He was graduated from West Point in 1879 and was commissioned in the cavalry. He served in several campaigns against the Indians and in 1894-8 was instructor in the United States military school at Fort Leavenworth, Kan. Upon the

opening of the war with Spain he was ordered to the front, where he rendered distinguished service at the battles of Las Guasimas and Santiago and was brevetted major and lieutenant-colonel. Since 1898 he has been superintendent at West Point, with the rank of colonel and regimental captain.

Mills, Anson, American soldier: b. Boone County, Ind., 31 Aug. 1834. He studied at West Point in 1855-7 and then went to Texas, where he was occupied in surveying and engineering, and established the boundary line between New Mexico, Indian Territory and Texas. At the outbreak of the Civil War he went to the front with the Federal army and served without leave of absence through the War. He was subsequently engaged in Indian warfare and was military attaché at the Paris Exposition in 1878. He is the inventor of the woven cartridge belt now exclusively used in both the United States and British armies. In 1897 he was promoted brigadier-general and was at his own request retired in that year.

Mills, Benjamin Fay, American Unitarian clergyman: b. Rahway, N. J., 4 June 1857. He was graduated from Lake Forest University (Ill.) in 1879, was ordained to the Congregational ministry in 1878, held a pastorate at Rutland, Vt., was a prominent evangelist in 1886-97. In 1897 he withdrew from the Congregational denomination owing to his liberal views, and in 1897-9 conducted independent religious meetings in Boston. In October 1899 he became pastor of the First Unitarian Church at Oakland, Cal. Among his books are: 'Power from on High' (1889); 'Victory through Surrender' (1892); 'God's World' (1893).

Mills, Clark, American sculptor: b. Onondaga County 1 Dec. 1815; d. Washington, D. C., 12 Jan. 1883. He went south, learned the millwright's trade, worked at New Orleans, and later at Charleston, where he was employed by a plasterer, and discovered a method for taking a cast from the living face which enabled him to make plaster busts cheaply. In 1845 he completed a bust in marble of Calhoun, which was placed in the Charleston city-hall in 1846. In 1848 he was appointed by the government to execute an equestrian statue of Andrew Jackson. This was the first large statue cast in metal in the United States. Mills was obliged to learn casting, since there was then no foundry in the country adequate to the work, and when the statue was at last completed it was at a loss to himself of \$7,000. This was later repaid to him by Congress in an appropriation of \$20,000 for a replica at New Orleans. His colossal equestrian statue of Washington, depicting the general at the battle of Princeton, was unveiled at Washington on 22 Feb. 1860. He also cast from designs by Thomas Crawford (q.v.) the statue of 'Freedom' which was placed surmounting the dome of the Capitol in 1863, and took a life-mask of President Lincoln shortly before the latter's death.

Mills, David, Canadian jurist: b. Oxford, Ontario, 18 March 1831. He was educated at the University of Michigan and entered early upon a public life. He served in the Dominion House of Commons 1867-96 and was editor of the *Canada Daily Advertiser*, London, Ont., 1882-7. In 1876-8 he was minister of the in-

COLONEL A. L. MILLS.

SUPERINTENDENT OF THE UNITED STATES MILITARY ACADEMY.

MILLS — MILLSAPS COLLEGE

terior and was minister of justice 1897-1901, since when he has been justice of the Supreme Court of Canada. He has contributed to the magazines many articles on public questions and has published 'The English in Africa' (1900)

Mills, Job Smith, American United Brethren bishop: b. near Portsmouth, Ohio, 28 Feb. 1848. He was graduated from the Illinois Wesleyan University and studied for the ministry. In 1874-80, 1885-7 he was pastor of Otterbein University, Watertown, Ohio, and in 1887-93 was professor in various branches and then president of Western College, Toledo. He was made bishop in 1893 and has since visited the principal universities of Europe. He has written: 'Mission Work in West Africa' (1898); 'Holiness' (1902); etc.

Mills, Lawrence Heyworth, American philologist: b. New York 1837. He was graduated at New York University in 1857, and at Fairfax Episcopal Theological Seminary, Va.; and entered the Episcopal ministry in 1861. He was stationed in Brooklyn for six years; retired from the ministry in 1867; studied Gnosticism and the Avesta in Europe 1872-87; and in the last named year, having established his reputation as an authority on the Zend-Avesta, went on Max Müller's invitation to Oxford, where he became professor of Zend philology in 1898. He contributed largely to Oriental journals various papers on the Gāthās and early Zoroastrianism; translated 'Zend-Avesta' (Part III. in 'Sacred Books of the East,' 1887); and wrote: 'Study of the Five Zarathustrian Gāthās' (1894); 'Gāthās of Zarathustra in Metre and Rhythm' (1900); 'Dictionary of the Gāthic Language of the Zend-Avesta' (1902); and 'Zoroaster, Philo, and Israel' (1903).

Mills, Robert, American architect and engineer: b. Charleston, S. C., 1781; d. Washington, D. C., March 1855. He was a pupil of the architect Benjamin Latrobe (q.v.), and beside designing important structures in Philadelphia, including the single-arch bridge across the Schuylkill, erected custom-houses and marine hospitals in various parts of the United States and the Washington Monument in Baltimore. In 1837 he was appointed architect of the general government at Washington, where he built the Treasury, General Post-Office, and Patent Office, and designed the Washington Monument. He published: 'Statistics of South Carolina' (1826); 'American Pharos, or Lighthouse Guide' (1832); etc.

Mills, Roger Quarles, American lawyer and politician: b. Todd County, Ky., 30 March 1832. He moved to Texas in 1849, and studied law; was admitted to the bar at 20, the Texan legislature removing the disability of minority; and began practice at Corsicana. In 1859 he was elected to the Texas legislature. On the outbreak of the Civil War he joined the Confederate service; he was at the battle of Wilson's Creek; and as colonel of the 10th Texas infantry led his regiment at Arkansas Post, Chickamauga, Missionary Ridge, New Hope Church, and Atlanta. At Chickamauga, when General Deshler fell, he took command of the brigade. In 1872 he was elected to Congress as a Democrat, serving till 1892; he was chairman of the House committee on ways and means, and drafted the

Mills Tariff Bill, which, however, failed to become a law. In 1892, he was elected to the Senate to fill an unexpired term, and in 1893 was re-elected for the full term of six years.

Mills, Samuel John, American Congregationalist clergyman: b. Torrington, Conn., 21 April 1783; d. at sea 16 June 1818. He was graduated from Williams College in 1809, where he had as an undergraduate organized the first society of foreign missionaries in America, and he afterward studied at Yale and at Andover Seminary, where he succeeded in interesting many students in the missions. In 1810 he succeeded in placing his project so favorably before the general association of Massachusetts that the American Board of Commissioners for Foreign Missions was formed. He was licensed to preach in 1812 and at once went on a missionary tour through the Southern States, and made a second tour in 1814, succeeding in organizing various religious societies. He was ordained to the ministry in 1815 and after spending two years in various American cities in the furtherance of his plans was sent to Africa in company with Rev. Ebenezer Burgess to select a site for a colony. They succeeded in their mission and having spent two months in what is now Liberia sailed for home, Mills dying before reaching port. Consult Spring, 'Memoirs of Samuel J. Mills' (1820).

Mills, Walter Thomas, American Socialist lecturer: b. Duane, N. Y., 1856. He was graduated from Wooster University in 1885, and since that time has devoted himself mainly to lecturing and the study and discussion of political subjects. He was one of the editors of the 'New Voice' (1885-7); and editor of the 'Statesman Magazine,' Chicago (1887-90). He has lectured at different colleges; was the first delegate sent by the American Federation of Labor to the British Trades Congress in 1892; and was general chairman on Labor Congresses for the World's Fair at Chicago. In 1893-1900 he was engaged in trying to establish a self-supporting farm scheme; in 1900 he allied himself with the Socialist party, and established the International School of Social Economy, of which he has been principal. This school had in 1903, 2,800 correspondence students, and held four sessions of special training school courses. He has written 'Science of Politics' (1887); 'Social Economy' (1903); and numerous Socialist pamphlets.

Mills Bill. See **TARIFF**.

Mills College, at Mills College (P. O.) in Alameda County, Cal., was founded in 1871 as Mills Seminary for Young Women. It was chartered as a college in 1885. It has preparatory and business departments and a college department, the courses of which lead to the degrees of A.B. and B.L. In 1903 there were connected with the college 30 instructors and 250 students. The property was valued at \$410,000, and the endowment was \$150,000.

Mill'saps College, in Jackson, Miss., founded in 1892 by the M. E. Church South. The courses of study lead to the degrees of A.B., B.S., and Ph.B. In 1902 there were connected with the school 13 professors and instructors and 250 students. There were about 5,000 bound volumes and 3,000 pamphlets in the library, valued at \$11,000. The grounds,

MILLSPAUGH — MILNE

buildings, and apparatus were valued at \$90,000; the productive funds were \$111,000; and the total annual income was \$13,000. In 1902 the benefactions were \$10,000.

Millspaugh, milz'pā, Charles Frederic, American botanist: b. Ithaca, N. Y., 20 June 1854. He studied a year at Cornell; was graduated at the New York Homœopathic Medical College in 1881; practised medicine for 10 years; and became botanist of West Virginia University in 1891, professor of medical botany in the Chicago Homœopathic Medical College in 1897, having been curator of the department of botany in the Field Columbian Museum since 1894. He traveled in Mexico, in Brazil, and in the West Indies, and is the author of 'American Medical Plants' (1887); 'Flora of St. Croix, D. W. I.' (1902); 'Plantæ Yucatanæ' (1903); etc.

Millspaugh, Frank Rosebrook, American Protestant Episcopal bishop: b. Nichols, N. Y. He was graduated from the Shattuck School, Faribault, Minn., in 1870, and from the Seabury Divinity School there in 1873. He entered the Episcopal ministry in the year last named, served as missionary in Minnesota 1873-6, was subsequently dean of the Omaha (Nebr.) Cathedral, rector of St. Paul's, Minneapolis, and dean of Topeka (Kan.) Cathedral. In 1895 he was consecrated bishop of Kansas.

Millstone, one of the two cylindrical stones used to grind grain into flour (q.v.). The best foreign stones are the German basaltic lava quarried near Cologne, and the French hurstone; both are imported into the United States in small pieces from which the cylindrical stone is built up. The native stone is commonly used in the single piece: a sandstone found in Ulster County, N. Y., and in Lancaster County, Pa., and a burstone much like the French, are the best materials, being hard and tough and having a cellular structure, which in the burstone is due to the presence of fossil casts. The lower stone is usually fixed; the upper stone is the "runner." Each stone is deeply scored with furrows, which lead the milled grist away from the centre; the intervals are styled "land"; and the hole in the centre is called the "eye." A depression about the eye is the "bosom." The scheme for scoring the stone varies greatly. The roller process (described under *Flour*) has relegated the millstone to the minor grist mills.

Millvale, Pa., borough, in Allegheny County; on the Allegheny River, and on the Pittsburgh & W., the Buffalo, R. & P., and the Pennsylvania R.R.'s; opposite Pittsburgh. It is really an industrial suburb of Pittsburgh; its chief manufactures are lumber, iron products, saws, dressed stone, and steel products. The government is administered by a Burgess, who holds office three years, and a council. The borough owns and operates the electric light plant and the waterworks. Pop. (1890) 3,809; (1900) 6,736.

Millville, mil'vil, N. J., city in Cumberland County; on the Maurice River, and on the Pennsylvania railroad; about 43 miles south of Philadelphia. In 1801 Millville was incorporated as a town, and in 1866 received its city charter. It is a manufacturing city; its chief industrial establishments are foundries, glass factories, dye works, bleacheries, cotton mills, and ma-

chine shops. It has a fine high school, two libraries, several good church buildings, a large park in which is Union Lake, a body of water about three miles long and three fourths of a mile wide, and a number of fine private residences. The government is administered under a charter of 1873, which provides for a mayor, who holds office three years, and a common council, 12 of whose members are elected from wards, and one at large. Pop. (1890) 10,002; (1900) 10,583.

Milman, Henry Hart, English historian and poet: b. London 10 Feb. 1791; d. near Ascot 24 Sept. 1868. He was graduated from Brasenose College, Oxford, in 1814, became a fellow of the college in that year, took orders in 1816, was appointed incumbent of St. Mary's, Reading, in 1818, and was professor of poetry at Oxford in 1821-31. In 1835 he became rector of St. Margaret's, Westminster, and in 1849 dean of St. Paul's. His best-known works are his 'Fazio,' a poetical drama (1815), first presented at London in 1818 with great success; 'History of the Jews' (1830); and his 'Latin Christianity' (1855), an excellent general survey written with admirable candor and breadth. Among his other publications are: 'The Fall of Jerusalem' (1820), a dramatic poem; 'History of Christianity under the Empire' (1840). Consult A. Milman, 'Henry Hart Milman' (1900).

Mil'more, Martin, American sculptor: b. Sligo, Ireland, 14 Sept. 1844; d. Roxbury Highlands, Boston, Mass., 27 July 1883. He studied at Boston with Thomas Ball, and established there his own studio. In 1863 he executed for the Sanitary fair the statuette 'Devotion,' later studied for a time in Rome, where he made busts of Pius IX., Charles Sumner, Wendell Phillips, Emerson, and others of prominence, and designed the soldiers' and sailors' monument on Boston Common, for which he had been commissioned by the city. This monument, generally regarded as his greatest work, was dedicated in 1877. He executed also the soldiers' monument at Charlestown, Mass., a mediocre composition 'America' at Fitchburg, Mass., and the 'Weeping Lion' at Colby University, Waterville, Me. His bust of Sumner is in the Metropolitan Museum, New York; that of Ticknor in the Boston Public Library; and a bronze copy of that of Phillips is also in the Boston Library, to which it was presented by the Phillips Memorial Association in 1900. One of his best known works is the huge granite Sphinx in Mount Auburn cemetery, Cambridge, Mass.

Miln, Louise Jordan, English journalist and author: b. 5 March 1864. After extensive travel she contributed to various London journals, such as the *Pall Mall Gazette*, the *Morning Post*, the *Times*, and particularly the *British Realm*, edited by her husband, G. C. Miln. Among her publications are: 'When We Were Strolling Players in the East' (1894); 'Quaint Korea' (1895); 'An Actor's Wooing' (1896); and 'Little Folk of Many Lands' (1899).

Milne, miln, John, English geologist: b. Lancashire 1848. After study at the Royal School of Mines, London, he traveled in Iceland, mined in Newfoundland (1873-4), and in 1875 became professor of mining and geology under the Japanese government. He is a recog-

MILNE-EDWARDS — MILTIADES

nized authority on seismology, published a volume on 'Earthquakes' ('Natural Science' series), and established the Japanese Seismological Society (1886).

Milne-Edwards, Henri, ön-rē mēl-nā-dwār, French zoologist: b. Bruges 23 Oct. 1800; d. Paris 29 July 1885. His father was an Englishman, but the son was born and educated on the Continent; became M.D. at Paris in 1823; then began to study the zoology of lower animals; made two dredging expeditions near Granville in 1826 and 1828, describing his finds in a paper entitled 'Récherches anatomiques sur les Crustacés' (1828); was elected to the Academy of Sciences in 1838, succeeding Cuvier; in 1841 became professor of entomology in the Museum; held professorial chairs in the scientific faculty of the University of Paris; and in 1864 became director of the Museum. From 1837 he was an assistant editor of the 'Annales des Sciences Naturelles.' He established the idea of the division of physiological labor and was not in accord with modern theories of evolution, as is to be seen from his 'Introduction à la Zoologie générale' (1853). He also wrote 'Eléments de Zoologie' (1834); 'Histoire naturelle des Crustacés' (1837-41); 'Histoire naturelle des Coralliaires' (1858-60); and an unfinished work, 'Leçons sur la Physiologie et l'Anatomie comparées de l'Homme et des Animaux' (1855-84).

Milner, Sir Alfred, VISCOUNT MILNER, English administrator: b. Bonn, Germany, 1854. He studied in Germany, where his father had been instructor in English at the University of Tübingen, then at King's College, London, and at Balliol, Oxford; was fellow of New College, Oxford; studied law; and after several years in journalism, part of the time on the *Pall Mall Gazette*, became private secretary to Mr. Goschen, chancellor of the exchequer, in 1887. From 1889 to 1892 he was under-secretary of state for finance in Egypt; in 1892 became chairman of the Board of Inland Revenue; and in 1897 was appointed to the double post of high commissioner for South Africa and governor of Cape Colony. He still holds the former post. In 1900 he became administrator of the Transvaal and Orange River colonies, of which he was made governor in 1902. He took a prominent part in all negotiations with the Boers before, during, and after the war. He was made G.C.B. and baron in 1901 and viscount in 1902, is a man of much culture, and wrote 'England in Egypt' (1892).

Milnes, milz, Richard Monckton. See HOUGHTON, RICHARD MONCKTON MILNES.

Milo, mī'lō (Mīlō), ancient Greek athlete. He was a native of Crotona, in Magna Græcia, Italy, and celebrated for his great strength. He bore off the prize six times in the Olympic games, and on an equal number of occasions at the Pythian. He was appointed to command an army against the Sybarites, and at the battle at the Crathis, 511 B.C., his great strength is said by Diodorus to have given the victory to the Crotonians. Many anecdotes are related of him. He once carried a heifer of four years to the sacrifice on his shoulders, killed it with a blow of his fist, and afterward, it is added, ate the whole of it on one day. His death is characteristically related. When enfeebled by age he attempted to rend open the

trunk of a tree partially split by wood-cutters, but the wood closing on his hands, held him fast, and he was attacked and devoured by wolves.

Milo, Titus Annius, Roman tribune and political leader: b. Lanuvium in early part 1st century B.C.; d. district of Thurii 48 B.C. In 57 B.C., when tribune of the plebs, his quarrel with Publius Clodius began. Seeking preferment in the state, he became the ally of Cneius Pompey, urging the recall of Cicero from exile, whither he had been sent at the instance of Clodius, as a pretext for their acts. Bands of gladiators in the employ of Milo and of Clodius kept Rome in constant terror by their skirmishes. Finally, in a clash at Bovillæ, on the Appian Way, Clodius was murdered 20 Jan. 52 B.C. Milo was impeached for acts of violence in occupying public places and going about under arms; and for bribery in his canvass for the consulship. His trial began 4 April 52 B.C. Cicero undertook his defense, but found opinion such that the speech was not made. In a revised and enlarged form it was sent by Cicero to Milo at Massilia (Marseilles), whither he had gone into exile upon his condemnation under the first count.

Milo, or Milos. See MELOS.

Mil'osh, prince of Servia. See SERVIA; OBRENOVITCH.

Milouna (mī-loo'nā) **Pass**, Greece, a frontier-pass of the Olympian Mountains in Thessaly, a few miles north of Tyrnavos. On 18 April 1897 it was the scene of a fierce battle between the Turks and Greeks during the Græco-Turkish war of that year. About 50,000 men were engaged on both sides, and the Greeks were defeated with heavy loss.

Milreis, mīl'rēs, or **Milrei**, a Portuguese coin and the unit of account in Portugal. A thousand reis is one milrei, equal to \$1.06. In enumeration the figure \$ is used to denote the thousandth place, thus one milrei is written 1\$000. The colon marks the place of contos (one million reis), the period the place of thousands of millions.

Mil'roy, Robert Huston, American soldier: b. Washington County, Ind., 11 June 1816; d. 1890. He was graduated from Norwich University, Vt., in 1843 and served in the Mexican War, after which he studied law and was admitted to the bar in 1849. In 1851 he was appointed justice of the 8th judicial circuit court of Indiana. When the Civil War broke out he organized a company of volunteers and was mustered into service as colonel, later receiving the rank of brigadier-general, and in 1862 was made major-general. In 1863 he was engaged in battle with a superior force under General Lee and after a gallant fight of three days' duration was compelled to retreat. An investigation of his conduct followed, which resulted favorably for Milroy, who, however, resigned in 1865. He was trustee of the Wabash & Erie railroad in 1868, in 1868-74 was superintendent of Indian matters in Washington Territory and in 1874-85 Indian agent.

Miltiades, mil-tī'a-dēz, Athenian general: d. 489 B.C. He was a descendant of the Philaides, and, after being archon at Athens in 524, inherited a minor principality in the Chersonesus in 518. He governed well there; accompanied Darius against the Scythians in 515; and being left at the bridge across the Danube urged its

MILTON

destruction in order that Greece might thus be rid of a possible Persian enemy. This plan was vetoed by Histiaeus, another Greek tyrant. In 493 he left his kingdom for fear of the Persians, and upon their invasion of Greece in 490 became one of the ten generals of the Athenian army. Each of the other generals retired in Miltiades' favor, but he refused to lead the army until his own day of command came. Then he won the great battle of Marathon, routing the Persian land forces. The victorious general in the next year asked the state of Athens for a fleet of 70 ships, got his request, but did not explain that he wished to punish the people of Paros, and, when his expedition failed and its purpose was known, he was impeached, fined 50 talents, and imprisoned for lack of ability to pay. He died in prison of a wound got at Paros.

Milton, John, English poet and statesman: b. London 9 Dec. 1608; d. there 8 Nov. 1674. His father, a Puritan notary and a man of business ability and much musical skill, had been disinherited by his Catholic parents for his adhesion to the Protestant faith. He was the boy's first teacher, especially in music, making a good organist of him; and Thomas Young, a Scottish clergyman, taught him the classics before he was entered at St. Paul's School, about 1620. There the boy devoted himself eagerly to Latin, Greek, French, Italian, and Hebrew, and thence in 1625 he entered Christ's College, Cambridge, where he stayed seven years, won the nickname of "the lady of Christ's College," either by his modesty or almost feminine beauty, was engaged in some quarrel with one of his tutors, but was generally most highly esteemed by the academic authorities, who urged him to remain in residence after his graduation with the bachelor's degree in 1632. He had already written the noble 'Ode on the Nativity' (1629). His education had been for the Church; for a time he thought of studying law, but soon devoted himself most solemnly to literature. Probably as a part of this deliberate plan to become a poet he spent six years on his father's estate at Horton, and there wrote, perhaps as early as 1632, 'L'Allegro' and 'Il Penseroso,' first printed in 1645; in 1633 and 1634 the masques 'Arcades' and 'Comus,' for both of which Milton's friend Henry Lawes (q.v.) composed the music; and in 1637 'Lycidas,' a dirge for his friend Edward King, showing his theological and political views scarcely less clearly than 'Comus' had presented his ideas on personal morality and purity. Shortly after his mother's death and the favorable issue of a suit at law against his father, in April 1638, he started upon an Italian tour. He stayed at Florence and Rome two months each on his outward trip, and tarried in both these cities for a time upon his homeward journey, which was made the more hurried by the news of political strife in England, but did not come so soon as to hinder him from meeting many famous continental scholars and authors. Upon his return to England he took some pupils and attempted to carry out his peculiar ideas on education; at the same time beginning to meditate a great poem, now thinking of the Arthurian legend as the theme, and now turning to the story of 'Paradise Lost,' which he planned in several different forms. But his immediate entry into literature was controversial, not

poetical: in the early summer of 1641 he published the pamphlets 'Of Reformation,' an attack on the historic episcopate, and 'Animadversions upon the Remonstrance Defence' and 'Prelatical Episcopacy,' both answers to replies to his first tract; and in 1642 wrote 'The Reason of Church Government urged against Prelacy,' which called out personal abuse from Hall, bishop of Exeter, answered by Milton in kind. Soon after the outbreak of the Civil War Milton married Mary Powell, who was 17, just half his own age, soon became unhappy, left her husband, and so provoked him to his bitter and biased pamphlet on Divorce. The book urged "contrariety of mind" as sufficient cause for divorce, and was cried down on all sides; the fact that it had been printed without license roused the legal authorities against the book, and this attack prompted Milton to his most famous prose work, the defense of the freedom of the press, styled 'Areopagitica' (1644), which was followed by the 'Tetrachordon,' an attempt to strengthen with Scripture his views on divorce. But shortly afterward Milton was reconciled to his wife, who bore him four children between 1646 and 1652, and died in the latter year. In 1645 his collected poems in English and Latin appeared; and at about the same time his break with the Presbyterian party began, Milton urging that Presbyter was only Priest "writ large." His political stand at this time was with the army, which had worsted not only the royalists but Presbyterians and Parliamentarians. Hence he warmly defended the execution of Charles I. in 'The Tenure of Kings and Magistrates' in 1649; became Latin secretary to the new council of state in the same year; and in this capacity again plunged into controversial writing. He replied to the 'Eikon Basilike' (then attributed to Charles I. himself, but actually the work of one John Gauden), with 'Eikonoklastes'; to Salmasius' 'Defensio Regia pro Carolo I.' ('Defense of King Charles I.'), with a 'Pro Populo Anglicano Defensio' ('Defense of the People of England'); and to Alexander More with two more polemics, which like those already named are illogical, grossly abusive of his opponent, and otherwise savage and ill-considered, though in every case scarcely more so than the pamphlets he was answering. In this warfare of spite and abuse Milton's untiring industry and zeal in behalf of the commonwealth destroyed his sight; he says himself that his 'Second Defense' was written when by his physician's orders he should not have been using his eyes, but he counts the loss well repaid. Through Cromwell's protectorate Milton remained Latin secretary, and as such drafted or translated many important state papers, notably the protest against the persecution of the Vaudois (1655). In November 1656 Milton married Catharine Woodcock, who died with her baby October 1657; she is best known by the sonnet after her death; in 1888 George W. Childs of Philadelphia erected a memorial window to her in St. Margaret's, Westminster. His life at this time was lonely save for visits from distinguished foreigners. Momentarily he seemed to be in danger at the Restoration; his arrest was ordered and his more virulent writings burned, but then to the surprise of all he was included in the Act of Indemnity, possibly at the entreaty of Sir William Davenant, for whom he had done a like service years before.

MILTON — MILWAUKEE

In 1663 he married for the third time. His wife, Elizabeth Minshull, a pleasant and tactful woman, seems to have managed well for him and given him more time and peace than he had ever had before for poetical composition, and he set himself systematically to work on his epic of the fall of man, 'Paradise Lost,' which was begun in 1658 and finished in 1665. Modern criticism has shown that this poem owes something to Cædmon's Anglo-Saxon 'Genesis,' to Andreini's 'Adamo,' and to Vondel's 'Lucifer'; but it still stands the great epic in English literature, and in world literature, one of the great "artificial" or "learned" epics, as contrasted with the natural epic such as the 'Iliad,' the 'Nibelungenlied,' or the 'Kalevala.' For this immortal work the poet could scarcely find a publisher and received at last £10, in two payments, his widow getting £8 more; it is incorrect to state that the poem did not meet with contemporary success, the fact that 4,500 copies were sold by 1688, proving the contrary. In 1671 appeared Milton's last poems, 'Paradise Regained,' a less powerful sequel to 'Paradise Lost,' but equally ranked with it by the author, and 'Samson Agonistes,' a striking combination of Semitic theme, Greek tragic manner, and matchless English verse. The poet died suddenly and peacefully, and was buried in the Church of St. Giles, Cripplegate, London. His last work, save for some minor pamphlets, was a 'History of Britain' (1669). So late as 1902 a work attributed to Milton was published in London. This was a romance in prose and verse, styled 'Nova Solyma,' translated from the Latin original by Walter Begley. The character of Milton's poetry can not be summed up here; it will be enough to repeat Matthew Arnold's criticism, that he has the true classical and epic grandeur, majesty, and solemnity. Consult: Masson, 'Life of John Milton' (1859-80; partly revised); 'Lives,' by Garnett (in 'Great Writers' series 1890); and Pattison ('English Men of Letters' series, 1880); Masterman and Mullinger, 'The Age of Milton' (1897); the essay by Johnson (1797), that by Macaulay (1840), and one by Lowell (1845); Trent, 'A Short Study of Milton' (1899); Corson's 'Introduction to the Works of Milton' (1899); Raleigh, 'Milton, a Study' (1900); and the editions of the Poetical Works by Masson (1890), and of the Prose Works by Saint John (1848-53).

Milton, Fla., town, county-seat of Santa Rosa County; at the head of Blackwater Bay, which opens into Pensacola Bay, and on the Louisville & Nashville railroad; about 18 miles north by east of Pensacola. The industries of the town are chiefly connected with ship-building and lumbering. It is the seat of Santa Rosa Academy and it has a public library which contains about 5,500 volumes. Pop. (1890) 1,455; (1900) 1,204.

Milton, Mass., town in Norfolk County; on the Neponset River, and on the New York, N. H. & H. railroad; about six miles south of Boston. The first permanent settlement was made in 1637, but Milton was at first a part of Dorchester; it became a separate town in 1664. Within the town limits are the villages of East Milton, Blue Hill, Matapan, and Lower Mills. The chief industrial establishments are the chocolate factory, which has 500 employees;

the paper factory, 100 employees; the bakeries, 100 employees; and in the granite works about 400 employees. Other industries are connected with manufacturing crackers, cement, rubber goods, and the raising and marketing of garden stuff. Milton is a residential suburb of Boston and the seat of the Milton Academy. The town has one public library, the Milton Convalescent Home, the Leopold Morse Home, and seven fine church edifices. It has also a station of the United States Meteorological Bureau and an Observatory located on the crest of Blue Hills. The one bank has a capital of \$100,000, and its business amounts to about \$700,000. The town is governed by town meetings. It has been the home of two colonial governors of Massachusetts; one Thomas Hutchinson, the historian, the other Jonathan Belcher, who was also colonial governor of New Jersey. Pop. (1890) 4,278; (1900) 6,578. Consult Teele, 'History of Milton, Mass.'

F. A. LOWELL,
Editor 'Milton Leader.'

Milton, Pa., borough in Northumberland County; on the Susquehanna River and the Pennsylvania Canal, and on the Philadelphia & Reading and Philadelphia & Erie division of the Pennsylvania R.R.'s; about 66 miles north of Harrisburg. It was settled in 1768 by Marcus Hulings, and laid out in 1792 by Andrew Straub. It was incorporated as a borough in 1816. Milton is a manufacturing place; the chief industrial establishments are car works, which have 525 employees; iron mills, with 950 employees; machine-shops, 175; knitting and spinning mills, 320; bamboo furniture factories, 80; nail mill, 100; and other manufactories employing about 450 persons. The industries are all of home development; the report of the factory inspector shows that Milton has the largest per cent of population wage earners in the State. There are 11 churches and good public schools. The three banks have a combined capital of \$400,000. The government is vested in a burgess and a council of 15 members elected for three years. About 90 per cent of the population are Americans. Pop. (1890) 5,317; (1900) 6,175.

WM. P. HASTINGS,
Editor 'Evening Standard.'

Milton College, in Milton, Wis., a coeducational institution, founded in 1844 by the Seventh Day Adventists as Du Lac Academy; in 1848 the name was changed to Milton Academy, and in 1867 it was incorporated as a college. In 1902 there were reported 12 professors and instructors; 141 students; about 10,000 volumes in the library; grounds, buildings, and apparatus valued at \$36,000; productive funds, \$84,000; total income about \$11,500 per year. In 1901 the benefactions were nearly \$4,000. The number of graduates was (1902) about 300.

Milwaukee, mil-wā'ke, Wis., capital of Milwaukee County and the metropolis of the State; on the west shore of Lake Michigan, at the confluence of three rivers — Milwaukee, Menomonee and Kinnickinnic. The converging streams flow into a bay of great natural beauty, which extends nearly three miles inland and affords excellent harborage for vessels within the shelter of two miles of breakwater constructed by the Federal government.

MILWAUKEE

Topography.—A distance of six miles separates the high north and south headlands that mark the extremes of the bay. The intervening shore, except around the deltas formed by the disemboguing streams, is a series of bold bluffs that overlook the harbor from an altitude varying from 85 to nearly 300 feet above Lake Michigan, thence sloping gradually to the lower levels of the rivers that enter the city from the north, south and west respectively. The river bottoms were, half a century ago, stretches of wild-rice marshes and tamarack swamps, but the leveling processes prompted by business necessities have transformed them into solid ground whereon the chief business section has been built. The residence districts are located on the higher altitudes above the three valleys formed by the streams that trisect the city.

Trade and Industries.—Its harbor facilities have made Milwaukee a manufacturing city chiefly. All of the rivers being navigable, and the present channels supplying a dockage of 23.63 miles available to vessels, hundreds of manufacturing establishments are located on the upper reaches of the streams, with slips for additional vessel facilities. The Milwaukee and Menomonee rivers are each provided with turning basins that can be used by the largest lake vessels, and a large turning basin in the Kinnickinnic River, a mile from the harbor entrance, will soon be constructed. The deepest draft vessels can navigate the rivers and canals. The fleets of six independent steamship lines, and a fleet of car-ferries that is operated uninterruptedly all the year, furnish the water transportation to Milwaukee manufacturers. Iron and copper ore and lumber from the Great Lakes districts, and coal from the mines of the Middle States are thus transported cheaply. Three great railroad systems and their connections supply rail transportation facilities. The chief industries of the city, in the order of their importance as regards annual product, are these: Metal, \$79,776,837; clothing, \$26,763,570; leather, \$24,235,307; beer, \$20,730,200; other industries, \$78,810,642. From 1880 to 1890 the total product of the city's industries increased 147 per cent. During the following decade the increase was 88.6 per cent. The manufacturing statistics for 1902 are as follows: Persons employed, 78,150; paid in wages, \$41,434,131; capital employed, \$153,202,051; value of products, \$230,316,562. The total volume of wholesale business amounted to \$326,371,153. The sum of \$8,153,180 was expended in new buildings.

Population.—Within the city's corporate limits are comprised 23½ square miles, a smaller area than that of any other city of considerable population in the United States. The first enumeration, in 1838, revealed a population of 700, which had increased to 9,666 by the date of the incorporation of the city in February, 1845. The number of inhabitants according to the Federal census of 1900 was 285,370. A city directory census in 1903 places the population at 322,923. The great bulk of the residents are workmen, and it is estimated that fully 80 per cent of them own their own homes. Local banking statistics show that in the seven savings deposit institutions 35,570 wage earners have aggregate deposits of \$10,517,123. This is an increase of 74.52 per cent in the number of depositors and of 93.65 in the aggregate deposits in a period of five years. There has been no considerable

strike in Milwaukee since the general labor disturbance of 1885, except a walk-out of street car employees in 1896. The population of the city is polyglot. A map of the city with division lines determined by the predominating nationalities inhabiting certain districts would bear much resemblance to that of Europe as to nomenclature. For many years the population was largely of German birth, and Milwaukee acquired the title of the "German Athens of America." The first German settlers came in 1838, but it was not until 1845 that large numbers of Germans began to make the young city their home. For nearly half a century their customs found expression in the chief social life of the city. At one time the number of daily newspapers printed in German was nearly twice the number printed in the English language. A theatre was built expressly for performances in German, with stock companies drawn from Germany. A German market hall was constructed. Six turner halls were erected, and a seminary for students of physical training was established. During the Civil War, one company of volunteers was composed wholly of German turners. German instruction has been part of the daily programme in every public school since 1857. The tide of German immigration was followed, beginning 20 years ago, by a stream of Poles, Dutch, Scandinavians and Bohemians, and more recently Italians and Syrians have established colonies in certain sections of the city. The preponderance of German population has now disappeared, although certain wards remain solidly German, and a German theatre, a German market place, flourishing organizations of turners, German musical societies, and places of amusement and recreation distinctively German attest the perpetuity of customs brought from the fatherland. The foreign-born inhabitants are grouped in various sections of the city. German, Polish, Bohemian and Scandinavian papers and periodicals are published in Milwaukee, including two dailies in the Polish and two in the German language. The first Polish daily paper established in the United States was printed here.

Churches.—In 82 of the 162 churches, sermons are preached in foreign languages, including German, Polish, Dutch, Scandinavian, Welsh, Bohemian, Russian and Italian. The seat of a Catholic archbishopric and of a Protestant Episcopal bishopric are located in Milwaukee. The 162 churches are distributed among the following faiths and creeds: Adventist, 1; Baptist, 9; Catholic, 31; Christian, 1; Christian Science, 4; Congregational, 8; Episcopal, 12; Evangelical, 7; Evangelical Association, 6; Jewish, 6; Lutheran, 38; Free Methodist, 2; Methodist Episcopal, 18; Mormon, 1; Presbyterian, 11; Reformed, 2; Spiritualistic, 2; Unitarian, 1; Theosophist, 1; Salvation Army barracks, 1; People's pulpit, 1. The property of the religious organizations is valued by the tax commissioner's department at \$6,411,940. Some of the church edifices are architecturally beautiful, notably Saint Paul's Church, in the Norman style; Saint Joseph's, Byzantine; Gesu, Immanuel and Saint James, Gothic. The convent of Notre Dame, which occupies a square in the heart of the city, is the mother house of the Order in the United States. In the suburb of St. Francis, the Catholic seminary of Pio Nono is surrounded by a magnificent tract

MILWAUKEE

of 200 acres. Marquette College (Catholic) and Concordia College (Lutheran) are located on the West Side.

Government.—The elective city officers are a mayor, treasurer, comptroller, attorney and a common council consisting of two aldermen from each of the 23 wards, chosen biennially. The administrative functions are vested in appointive boards whose titles indicate their duties: Board of school directors (23), board of public works (4), public debt (3), city service commission (4), fire and police commission (4), school commission (4), public library board (9), public museum board (9), park board (5), emergency hospital board (9). All of the boards and commissions with a membership of four are required by law to be bi-partisan. Certain features of their administration and organization are peculiar to Milwaukee. The total number of persons in city service is 3,111, and 2,923 of these are under civil service rules with tenure of office during good behavior, leaving but 188 persons, including elective and honorary officers, not subject to such rules. The city service employees affected by city service laws are in the following departments: Under the board of city service commissioners, 1,312; under the board of fire and police commissioners, 659; under the board of school directors, 952. The firemen and policemen were prior to 1885, when a bi-partisan board was created, removable for political causes; the official and labor service was placed within the shelter of a bi-partisan board's rulings in 1895; the school department has not been affected by politics since 1897. The school board organization is peculiar to Milwaukee. The school commission is bi-partisan, the mayor appointing one member of the four annually. Their sole duty is to select one third the membership of the board of school directors annually on a strictly non-partisan basis. The library and public museum boards are composed of three aldermen and six "citizen members" each, the library board electing its members as terms expire, except the aldermanic contingent, whom the mayor appoints.

Public Works.—Some advanced theories in municipal ownership and administration have found a footing. The waterworks property, valued at \$5,154,617, is owned by the city, the entire cost of construction and maintenance having been paid out of its proceeds, and its large surplus revenues now aid in defraying other municipal expenditures. A crematory for consuming garbage, which is collected by the health department, is also owned by the city. A free emergency hospital, originally a private benefaction, is maintained at public expense, likewise three large natatoriums all the year through, and in the summer free public bath houses on the lake beach and swimming schools on the upper Milwaukee River. In many of the public parks, of which there are 21, partly with boulevard connections, free public concerts are given semi-weekly. The total acreage of these parks is 571. Ten of them vary from 20 to 150 acres in extent, the others being small breathing spots distributed in various parts of the city. During six winter months, free public evening lectures for adults are given in public school halls, the expense being borne by the school fund. The city owns exposition grounds, though the building located upon them is the property of a

quasi-private corporation. A city-hall was completed in 1896 at a cost of \$1,200,000, and a library and museum building is valued at \$1,168,000, with contents. The library comprises 150,000 volumes. There are 239,291 specimens in the museum, including a remarkable collection of 5,244 different kinds of birds' eggs and nests, and of 2,529 arms and military accoutrements representing all nations and eras. Among the notable public works is a flushing tunnel connecting the Milwaukee River with the Lake, water being pumped from the Lake into the stream in such quantities (17,412,735,371 gallons last year) as to cleanse the channel whenever required to prevent offensive conditions. A system of intercepting sewers paralleling the streams has been partly constructed.

Education.—There are 54 public schools, including a school for the deaf-mutes and four high schools. The total enrolment is 36,000. A State Normal school, with an enrolment of 300 students, is the main source of supply for the teaching corps. Every primary and district school in the city, with two exceptions, has a kindergarten department, Milwaukee having been the pioneer city in the United States, a quarter of a century ago, to institute kindergarten instruction as part of the regular work in every school building below the high school grade. There are 71 parochial and private schools with a total enrolment of nearly 22,000. In addition to the institutions heretofore mentioned, the Milwaukee-Downer College for young women is located here, in a group of buildings recently completed in the northern suburban district near Lake Michigan. Part of its endowment is obtained from an organization of 600 women known as the College Endowment Association, who conduct annually series of University Extension lectures for their own members in the Athenæum building. The Athenæum is owned by the Woman's Club, was built by them and is maintained as a successful business venture by them. The Layton Art Gallery, managed through a board of trustees, is open to the public without admission charge, and is the gift of Frederick Layton. The Johnston Emergency Hospital building was given to the city by John Johnston.

History.—The first permanent settlement of Milwaukee is usually dated from 1818, when Solomon Juneau erected his little log cabin on the east side of the Milwaukee River. French and English traders had been here before that date, and a procession of Jesuit priests and French voyageurs had preceded them. The first recorded visit of a white man on the site of the future city is in the journal of Father Zenobe Membre, a Recollet missionary priest who accompanied Robert Cavalier de la Salle on his memorable exploratory trip from Lake Erie to the Illinois country in 1679. He notes that both Mascoutens and Foxes were dwellers "on the banks of the river called Melleoki." John François Buisson de Saint Cosme journeyed in 1699 along the west shore of Lake Michigan from Michilimackinac to the Mississippi. "On the seventh," he wrote, "we arrived at Melwarik (Milwaukee). This is a river where there is a village which has been considerable and inhabited by the Mascoutens and Foxes, and even some Pottawattamies." The word Melleoki and its numerous variants which by a process of evolu-

MIMEOGRAPH — MIMICRY

tion has become Milwaukee, is of Pottawattami origin and signifies "good land." Another definition accepted by some historians is "council place," this having been regarded as neutral territory by different tribes of Indians. The dwellers in the old Indian village were evidently a turbulent set, for Colonel Arent de Peyster, commandant at Michilimackinac, wrote of them in the early years of the Revolutionary War as "runagates—a horrid set of refractory Indians." Lieutenant James Gorrell, whose British regulars occupied the stockade at Green Bay in 1762 and gave it the high-sounding title of Fort Edward Augustus, wrote the name of the place as "Milwacky." An English trader lived among the Indians at this place in that year. Fur traders made brief stays in the village from time to time. Alexander Lafromboise and his brother were located as traders here in 1785, with a large stock of goods. In 1795 Jean Baptiste Mirandeau, a Canadian blacksmith who had married an Indian woman, built a cabin and made himself useful to the Indians by mending their firearms. He received as compensation game and furs. He died in 1819, being survived by a family of 10 children, who joined the Indians when the Milwaukee band was removed. Thomas Gummarsall Anderson, the son of a Loyalist, was a resident upon the site of the future city of Milwaukee from 1803 till 1806. He took an active part in the capture of Prairie du Chien by the British during the War of 1812. When Solomon Juneau arrived in 1818, he found a Pottawattamie village. He settled on the east side of the Milwaukee River, which later was called Juneautown; the west side of the river became Kilbourn town, after Byron Kilbourn (1834), and George H. Walker gave the name of Walker's Point (1834) to the region south of the Menomonee River. Each of the three natural geographical divisions became the nucleus of a little community, and acrimonious rivalry was a natural resultant. The different names of streets on opposite sides of the rivers, now connected by 28 bridges, are a survival of the bitter feelings then engendered. The village of Milwaukee, now the East Side, was organized 27 Feb. 1837; Kilbourn town, now the West Side, was annexed 11 March 1839; and Walker's Point, now the South Side, 5 Feb. 1845. The city was incorporated 5 Feb. 1845, and Solomon Juneau chosen the first mayor.

HENRY E. LEGLER,
Secretary Parkman Club.

Mim'eograph, an apparatus of recent invention by which copies of any document may be transcribed and multiplied. There are many varieties of the instrument now manufactured, and the process varies in each invention.

Mimes, mimz (Gr. *mimos*, a mime), a name given by the ancients to certain dramatic performance. The mimes among the Greeks consisted first of extemporary representations at festivals of ludicrous incidents of common life. They were afterward more artistically developed. The word *mimus* was applied by the Romans both to a species of comedy in which mimicry predominated, and to the actors in it. The mimes appear to have been originally represented at funerals, and the life of the deceased was caricatured by the actors. They were subsequently performed on the stage and under the Empire replaced the more refined Atellanæ. See ATELLANÆ FABULÆ.

Mimicry, in Nature. Mimicry is a technical term in the language of the exponents of organic evolution (q.v.) to indicate the gradually assumed and unconscious resemblance of given animals to others, due to the fact that by such a disguise, or resemblance to the former in shape, color, markings, mode of motion or other characteristics, the latter secure certain advantages in the struggle for existence. Such a gradually assumed resemblance, regarded as the result of a process of natural selection, is called "mimicry" or "imitation," although of course it is wholly unintentional on the part of the creatures themselves. Many animals, particularly among the insects, are imitated, because by reason of an unpleasant taste or odor, or of their excessively hard shells, they are rejected by insectivorous birds, reptiles, and mammals. On this account they are generally adorned with gay colors or are luminous at night, to make themselves recognizable even at some distance; and such display themselves leisurely, boldly and openly, before all eyes. To them belong entire families,—for example, among butterflies the danaiids (q.v.) and heliconiids, and among beetles the fireflies; which, accordingly, are imitated even in their frequently brilliant colors and markings by butterflies and beetles of other classes, whose kindred otherwise are subjected to a bitter persecution. Sometimes one particular prototype is followed by several imitators of wholly different classes, which associate themselves in a swarm with the former. Another category of animals often imitated is that of those provided with a formidable weapon, for example, wasps and ants, as well as individual poisonous snakes.

The phenomenon is most striking when animals of wholly different orders take part in the same imitations, for example, wasps and bees are imitated by butterflies, beetles, flies, orthopterans, and hemipterans, or ants by beetles, locusts and chinch-bugs. Poisonous snakes are not only mimicked by harmless snakes, but also by large caterpillars. In individual instances parasitic insects also appear to imitate their hosts, and then creep unrecognized into their nests; and even among plants it is believed that analogous phenomena can be demonstrated, for example, the imitation by so-called dead-nettles of the nettle avoided by cattle in pasture.

In an expanded sense, to mimicry is commonly assigned also the imitation of unrelish-

MIMIR — MIND READING

able, inanimate objects, as, for example, that of withered, gnawed and mold-covered leaves by butterflies or locusts, of bits of twig, particles of dung, cocoons whose contents are breaking out; or even the imitation, serving the mere purpose of concealment, of objects under and upon which an animal seeks refuge, for example, of green twigs and leaves, lichen-grown stones, barks, etc. This phase of the matter is coming to be more often distinguished, however, as "protective resemblance." A comprehension of the factors by which these imitations, frequently carried out to the most minute details and leading to the most complete deception, are produced, first became possible through Darwin's theory of natural selection; and above all it was the naturalists Bates and Fritz Müller who first furnished suitable explanations of the relations and processes concerned. It should be added, however, that the most recent study has discredited some of the conclusions of the earlier enthusiasts and has attributed many observed resemblances and parallelisms to other causes and influences.

Consult the writings of Fritz Müller, Darwin, Wallace, Bates, Belt, and the volumes of the 'Cambridge Natural History' (1895-1903).

Mimir, mē'mir, in Scandinavian mythology, the god of wisdom, and most celebrated of the giants.

Mimosa, a genus of herbs, shrubs, trees, and a few climbing species of the natural order *Leguminosæ*. The species, of which more than 200 have been described, are natives principally of the American tropics. They have pinnate leaves, usually spicate clusters of small flowers, followed by flat, oblong or linear pods which when ripe break into one-seeded joints. Many of the species are noted for their sensitive leaves which at nightfall close and droop. Others respond to a touch. Of these the humble or sensitive plant (*M. pudica*) is perhaps the best known. It is frequently cultivated in gardens, greenhouses and windows as a curiosity. Seeds may be sown in any garden soil and the plants either transplanted to pots or allowed to care for themselves. They are as easy to grow as peas.

Mi'na, an ancient Greek denomination of money. The Attic mina contained 100 drachmæ, and was valued at about \$16.

Mina-bird, or **Myna**, a starling or grackle (*Eulabes religiosa*), very familiar throughout India and eastward, nesting confidently in gardens. It has lively, entertaining manners, a pleasing song, and considerable powers of imitation, so that it is kept in cages by country people throughout the East, and often taken to Europe. Its color is a deep velvety black, with a white mark on the base of the quills of the wing. The bill and feet are yellow, and there are two yellow wattles on the back of the head. The Hindus regard it as sacred to Ram Deo. Certain other similar species are also called mynas in some localities.

Minæ'ans. See **SABÆANS**.

Min'aret (Arabic, *minarat*, a lantern), a tower generally surrounded with balconies, and erected in connection with the mosques in Mohammedan countries, from which the muezzin summons the people to prayer and announces the hours, bells not being used by the Moslems. See **MOSQUE**.

Minas, mē'nās, or **Bello Horizonte**, Brazil, the capital of the state of Minas Geraes, 60 miles northwest by rail of Ouro Preto, which it replaced as the administrative seat in 1894. It is a modern town with wide streets, electrically lighted, and adorned with handsome public buildings, elegant residences, and fine parks. Pop. 29,000.

Minas, Uruguay, the capital of the department of Minas, 56 miles by rail northeast of Montevideo. It carries on a trade in the produce of the surrounding agricultural region, and in the marble and granite of the neighboring quarries. Pop. 4,700.

Minas Geraes, mē'nās zhā'ris, Brazil, a southeastern state bounded north by Bahia, east by Bahia and Espírito Santo, south by Rio de Janeiro, and São Paulo, southwest by São Paulo, and west by Goyaz; area, estimated at 222,160 square miles. The surface is mostly mountainous, and though lying within the tropics its elevation renders the climate temperate and healthful; but the low tracts are periodically flooded, and contain extensive swamps and pools. It is rich in minerals, gold, silver, platina, copper, lead, diamonds, rubies, and other precious stones being found. Extensive iron-works have been erected in the neighborhood of Ouro Preto. Sugarcane, cotton, millet, tobacco, and coffee are cultivated. The cultivation of cereals is extensive, and the finest European fruits have been introduced. Vast herds of cattle and swine feed in the pastures and forests. Timber and dye-woods of the most valuable kind, together with numerous varieties of gums, balsams, and medicinal plants, grow freely in the latter. Some trade in home manufactures, and an extensive foreign commerce, have been established. For administrative purposes Minas Geraes is divided into fourteen comarcas. It sends twenty members to the general assembly, and ten to the senate. The provincial assembly is composed of 36 members. It sits at Minas (q.v.) since 1894 when the administrative seat was removed from Ouro Preto. Pop. (1890) 3,184,099.

Minch, The, Scotland, the channel off the northwest coast between the mainland and the island of Lewis; it is above 30 miles wide, and on either side are numerous lochs or sea-arms penetrating inland. It is connected with the Sea of the Hebrides on the south by the Little Minch, the channel between the island of Skye and Long Island; its narrowest part is about 15 miles wide.

Mincio, mīn'chō, Italy, a river, the ancient Mincius, which flows from the south extremity of Lake Garda, near Pescheria, and after forming the lake and marshes that surround Mantua, falls into the Po eight miles below the city. Its banks are remarkably fertile, and celebrated for their beauty by Virgil, who was a native of this country. It formed an important base of operations in the wars between France and Austria. The length of its course is over 100 miles.

MINDANAO — MINDORO

Mindanao, mên-dä-now', Philippines, the most southeastern and largest island of the archipelago, lying between lat. $5^{\circ} 35'$ and $9^{\circ} 50'$ N. and between lon. $121^{\circ} 53'$ and $126^{\circ} 28'$ E., northeast of Borneo. It is bounded on the east by the Pacific Ocean and on the west by the Sulu Sea; area 45,356 square miles; with its dependent islands 46,521 square miles.

Topography and Climate.—The outline of the island is very irregular, and the coast is uneven and much indented with deep bays and inlets; the shore line is 1,592 miles, and the width of the island from east to west 386 miles. The island is very mountainous particularly in the interior, the mountain system consisting of a number of irregular ranges extending generally north and south, and as a rule approaching near the coast. The mountain formation shows the effect of earthquake and volcanic action, and there are many volcanoes, some of which are active. The principal peaks are Apo (10,312 feet), near the southeastern coast, and Malindang (8,560 feet) in the northwest. The island is drained chiefly by two large rivers, the Grande de Mindanao (q.v.), flowing southwest and west, on the western side of the central mountain range, and the Butuán or Agusán, flowing northwest, on the eastern side of the same range. There are numerous other smaller streams and nine large mountain lakes. There are iron springs at Placer, in the province of Surigao; sulphur springs at Mainit, Surigao, and Balingasag, Misamis, and medicinal thermal springs at Malibato. As the island is within 10° of the equator, the climate is hot and humid, but more equable than that of Luzon; rains are frequent and heavy.

Forests and Fauna.—The island is covered with forests of valuable woods for ship- and house-building and furniture making; among these are the molave narra, (similar to the yellow pine), teak, ebony and cypress; the gum and resin producing trees and medicinal and dye plants also grow abundantly. Animal life is abundant in these forests; over 200 species of birds have been classified of which 17 species are peculiar to Mindanao and Basilan; deer, wild hogs, monkeys, and the haguang or colugo (q.v.) are numerous. Reptiles, including the giant lizard, iguana, and large snakes, particularly the boa, also infest the forests and crocodiles the river.

Industrial Resources.—The staple agricultural products are rice, sugar, cotton, corn, tobacco, indigo, coffee, and hemp; in 1899 Mindanao ranked fifth among the hemp-producing sections of the Philippines; other products of special value are cloves, nutmegs, cinnamon, and other spices, betel nuts and betel peppers. The most important industry is the cultivation and shipment of hemp, and forest products; large herds of cattle and horses are raised; and there is a little weaving of hemp and cotton fabrics for home use. Edible birds' nests are also gathered and exported. Communication is largely by water, as there are few roads except in the immediate vicinity of the chief towns, and the towns and villages are situated on the coast or on the large lakes and rivers. Gold is obtained in small quantities by the natives, and is doubtless abundant; coal, sulphur, copper and platinum are also reported.

* **People and Government.**—Mindanao is peopled mostly by tribes of the Moro race, among

whom the Mohammedan religion is dominant; Visayan peoples inhabit the provinces of Misamis and Surigao. The island was first occupied by United States troops in 1899, and since that time numerous garrisons have been established, and operations carried on with a view of regulating intercourse between the Filipinos and Moros, and of gaining the confidence of the people. The provinces of Misamis and Surigao were placed under civil government in 1901, the rest of the island remained under military control until June 1903, when a law was passed by the Philippine Commission, providing civil government for Mindanao (exclusive of the two provinces mentioned above) and its adjacent islands, under the name of the Moro Province. Pop. 495,660. See PHILIPPINE ISLANDS; MOROS.

Mindanao, Grande de, grän'dä dä mên-dä-now', a large river of the island of Mindanao, Philippines. It rises in the Rangayán Mountains, flows south to the Lake of Liguasan, and passing through this lake flows northwest to Illana Bay. About 25 miles from its mouth it divides into two branches, which enter the bay about five miles apart, with a large delta between them; the north arm is the larger and more navigable; the south arm is narrow and only five feet in depth. The river is navigable for 70 miles for small vessels not drawing over four feet. Its course is mostly through a very fertile region, and it drains an extensive plain with several large lakes; in length and volume it is the largest river of the Philippines. In the upper part of its course it is known also as the Pulangui.

Min'den, Neb., city, county-seat of Kearney County; on the Chicago, Burlington & Quincy railroad; about 120 miles west by south of Lincoln. It is in a fertile agricultural region in which stock raising is also a prominent industry. It has considerable trade in wheat, corn, hay, and live-stock. There are 3,500 volumes in the public school library. Pop. (1890) 1,380; (1900) 1,283.

Minden, Prussia, a town of Westphalia, on the left bank of the Weser, 35 miles southwest of Hanover. It is one of the oldest towns in Germany, and the streets in the ancient parts are narrow and crooked. It has a fine cathedral of the 13th century, in the early pointed Gothic style, a gymnasium, and an orphan hospital; manufactures of tobacco, chicory, chemicals, soap, lamps, machinery, etc., and an important transit and general trade. In 1759 the French were defeated here by an Anglo-Hanoverian army during the Seven Years' war. Pop. (1900) 24,327.

Mindoro, mên-dô'rô, Philippines, an island lying south of Luzon, a little north of the centre of the archipelago; length northwest to southeast, 110 miles; width, northeast to southwest, 56 miles; area, 4,050 square miles, with dependent islands, 4,108.

The island is mountainous, the general topographical features consisting of several high broken ranges forming an elevated plain in the interior; and from this plain sierras extend in different directions toward the coast, which is mostly low and marshy, especially on the north and east; on the west coast along Mindoro Strait is prairie land. The culminating point of the mountain system is Halcón Mountain in the

MINE GAS—MINE RUN

north (8,800 feet). There are numerous small rivers, but no general river system of main stream and tributaries. The climate is variable; the rainfall heavy and monsoons frequent; the western coast is temperate and healthy, but the northern and eastern coasts are hot.

At one time, before the decay of the Spanish monarchy, the rice yield was so abundant that Mindoro was called "the granary of the Philippines"; but the frequent attacks of Moro pirates destroyed the prosperity of the island, and the agricultural products are now unimportant, being almost entirely for home consumption. Rice, sugarcane, cocoa, tobacco, hemp, cotton, etc., are raised; the cultivation of hemp is increasing, and a small amount of cotton is exported to the island of Ipil. In the time of the early Spanish explorers reports of great mineral wealth, especially gold, were circulated; the real mineral resources are but little known, though as far as modern exploration has gone copper, gold, and coal have been found. The island is heavily wooded, and its chief commercial wealth is in forest products; the trees include cedar, ebony, mahogany, gum trees, gutta-percha, palms and dye woods. Near the principal towns wood-cutting and rattan splitting for the Manila market is the chief industry; rattan, buri, honey, forest gums, balao oil, pitch, and other forest products are the chief articles of export; tortoise-shell, obtained from the small neighboring islands, and canoes cut from a single piece of wood are also exported; and there is a considerable production of sago. There are only a few roads, access to inland villages being by mountain trails or by river-canoes; the local trade between coast towns is carried on mostly by native sailing craft; all exports for Manila and other islands are concentrated at ports of call for steamers.

In June 1902 civil government was extended to Mindoro and adjacent islands, and it was detached from the province of Cavité and made a sub-province of Marinduque (q.v.). The inhabitants of the interior are wild tribes, among whom the Manguianes predominate; the people of the north coast are mostly Tagálogs, those of the south coast, Visayans. Pop., estimated to include wild tribes of interior, 100,200.

Mine Gas, the same as fire-damp (q.v.).

Mine Run, Campaign of. On 7 and 8 Nov. 1863 Gen. Meade crossed the Rappahannock at Kelley's Ford and Rappahannock Station (qq.v.), and concentrated his army of 70,000 men in the vicinity of Brandy Station, Gen. Lee, with 50,000 men, withdrawing beyond the Rapidan to an intrenched line, the left of which covered some of the fords of the river, the right being perpendicular to it and extending to Bartlett's Mill on Mine Run. On 26 November Meade began the Mine Run campaign by sending the First, Fifth, and Second corps to cross the Rapidan at Culpeper Mine and Germanna fords, and the Third and Sixth corps to cross at Jacob's Mill, all five corps to converge upon the old turnpike and the plank-road near Robertson's Tavern, both leading to Orange Court House, and turn the right of Lee's position. An early start was made on the 26th, but owing to delay in some of the columns, all were halted for the night but a short distance beyond the river. The march was resumed at daylight of the 27th. The Second corps reached Robertson's Tav-

ern at 10 A.M., to find itself in the presence of a considerable body of Ewell's corps which Lee had hastened there, and it was ordered to remain on the defensive, until the Third corps, followed by the Sixth, came up on the right. But the Third corps was delayed. Lee, on discovering Meade's movement, had promptly ordered Early, commanding Ewell's corps, to move to the right. Part of his command had reached Robertson's Tavern and confronted the Second corps, and Johnson's division was moving in the same direction when it came into collision with the Third corps, on Payne's Farm, and a battle ensued, lasting until dark. Both sides claimed the advantage, but the engagement resulted in a delay to Meade's operations, and, as he claims, the failure of his campaign. The Union loss was 125 killed, 747 wounded, and 71 missing. Lee reported a Confederate loss of 545. The Second corps was severely engaged during the day, and advanced some distance beyond Robertson's Tavern. At night the First corps moved up to the support of the Second. The Fifth corps, which had supported Gregg's cavalry division in an engagement at Parker's store, on the Orange plank-road, was brought over to support the Second, and next morning the Third and Sixth corps came up on the right of the Second. On the 28th Meade advanced to the attack, but on driving in the Confederate pickets it was found that Ewell's corps had fallen back. Pursuit was made, the Second corps in advance, and after a march of two miles Ewell was found in position on the west side of Mine Run. A P. Hill had come up and formed on Ewell's right, covering the Orange plank-road. The line was very strong, and on it were 150 guns. It was after dark when the Second, Sixth, and First corps, with part of the Third, fronted this position. An examination of Lee's position convinced Meade that there was no probability of success in an attack in his immediate front, and he determined to send Gen. Warren, with his Second corps and a division of the Sixth, to feel for Lee's right flank and turn it if practicable. The 29th was spent in reconnoitering and demonstrations, while waiting for Warren's movement. Early in the morning of the 29th Warren started from Robertson's Tavern, crossed over to the plank-road, drove in the skirmishers of A. P. Hill's corps, and late in the day came upon Hill's position across the road. Warren reported to Meade that the conditions were favorable for an attack, and personally assured him that he could carry everything before him. Meanwhile some of Sedgwick's division commanders had discovered weak points on Lee's left, no works being thrown up, and Meade ordered an attack for the morning of the 30th, the right and centre to open with artillery at 8 o'clock, at which time Warren was to make the main attack, and at 9 o'clock Sedgwick was to assault Lee's left with five divisions of the Fifth and Sixth corps. Two divisions of the Third corps were sent to Warren, thus increasing his command to six divisions of 26,000 men. The batteries on the right and centre opened a furious fire at 8 A.M. The skirmishers of the First and Third corps advanced across Mine Run and drove in those of the enemy, and Sedgwick was about to assault when Meade ordered him to desist. He had received a despatch from Warren advising against an at-

MINE SURVEYING—MINERAL COLORS

tack on Lee's right, as it could not succeed. During the night of the 29th Warren had made dispositions for an overwhelming assault, but on the morning of the 30th he saw on the heights before him a line of strong works thrown up over night, well filled with infantry, and heavy batteries covering the slope up which it was necessary to charge, and therefore he deemed successful attack impossible. Meade rode over to Warren, who proved unchangeable in opinion, and Meade tried to arrange for an attack later in the day, but found it impracticable. The armies remained confronting each other that day and the next, and on the night of 1 December Meade withdrew to his former position beyond the Rapidan. Lee followed part way on the 2d. The Union loss in the Mine Run campaign, 26 November–2 December, was 173 killed, 1,099 wounded, and 381 missing. The Confederate loss was 110 killed, 570 wounded, and 65 missing. Consult: 'Official Records,' Vol. XXIX.; Humphreys, 'From Gettysburg to the Rapidan'; Pennypacker, 'Life of General Meade'; Wather, 'History of the Second Army Corps'; Powell, 'History of the Fifth Army Corps'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

Mine Surveying. See SURVEYING.

Mine Workers of America, United, an American labor organization, formed 25 Jan. 1890, to "unite mine employees that produce or handle coal or coke . . . and ameliorate their condition by means of conciliation, arbitration, or strikes." Its executive officers are president, vice-president, and secretary-treasurer; a National Executive Board is made up of these officers and of 25 delegates, one each from the various district divisions. The United Mine Workers made great gains in membership by its bituminous strike in 1897, and by the famous anthracite strikes of 1900 and 1902; the two last mentioned strikes were under the leadership of President John Mitchell (q.v.). The policy is typically aggressive and almost the entire funds of the union are used to support strikes and spread the organization. The organ is 'The United Mine Worker' (weekly, Indianapolis).

Miner, Alonzo Ames, American Universalist clergyman: b. Lempster, N. H., 17 Aug. 1814; d. Boston, Mass., 14 June 1895. He was educated in secondary schools, taught for a time, was ordained to the Universalist ministry in June 1839, was pastor at Methuen, Mass. (1839–42) and at Lowell (1842–8), was colleague of Hosea Ballou at Boston (1848–52), and full pastor (1852–62; 1874–95). In 1862–74 he was president of Tufts College (Medford Mass.). He originated the Universalist publishing house, Boston; was chairman of the American Peace Society, which he represented at the international congress, Paris, 1889; was Prohibition candidate for governor of Massachusetts in 1878 and for mayor of Boston in 1893; and was also once known as a lecturer on anti-slavery. He edited the 'Star of Bethlehem' at Lowell, and published: 'Bible Exercises' (1854–84) and 'Old Forts Taken' (1878–85).

Miner, Thomas, American physician: b. Middletown, Conn., 15 Oct. 1777; d. Worcester, Mass., 23 April 1841. He was graduated at Yale

College in 1796. The next six years were passed in teaching, and in the study of law, which in 1803 he abandoned for medicine, and in 1807 he commenced practice at Middletown. There prevailed about 1809 in the Connecticut Valley a malignant epidemic fever, for which Dr. Miner and his friend Dr. William Tully pursued a new mode of treatment, the former making careful notes of his cases, and numerous autopsies of those which proved fatal. In 1819 he was compelled by disease of the heart to withdraw from active life, and confined himself to a consulting practice and writing. In 1823 he published, in connection with Dr. Tully, 'Essays on Fevers and Other Subjects,' and in 1825 a treatise on 'Typhus Syncopalis.' Both works enjoyed a wide circulation.

Miner, William Harvey, American journalist and author: b. New Haven, Conn., 5 March 1877. He was graduated from Columbian University in 1899, was for a time on the staff of the Lowell (Mass.) Mail, and published: 'George Catlin: A Memoir' (1900); 'Daniel Boone' (1900); 'The Lewis and Clark Expedition' (1901); 'The Rowfant Club' (1903).

Mineral Acids, Toxicology of. Ingestion of sulphuric acid causes pain in mouth, nose, throat, and epigastrium; bloody saliva; vomiting; bloody diarrhoea; feeble pulse; cold, damp surface; and collapse. Ulceration of stomach and larynx may occur and if the patient survives a form of Bright's disease follows quickly. The antidote is any available alkali, as soap, chalk, magnesia, or whitewash, scraped, perhaps, from a wall. Hydrochloric acid (q.v.) causes similar though possibly less severe symptoms, and recovery is more often possible. The antidotes are the same. Nitric acid (q.v.) exceeds sulphuric in the violence of the symptoms caused, with sudden death. Instead of black sloughs in the mouth, oesophagus, and stomach, such as occur in sulphuric-acid poisoning, in nitric-acid intoxication yellow sloughs and stains are found after death. Nitromuriatic-acid poisoning resembles poisoning by nitric acid in symptoms and pathological results. Similar yellow staining is found. The antidotes are alkalis. Phosphoric acid (q.v.) is not corrosive to animal tissues, though the glacial acid coagulates albumen. Its antidote is any alkali at hand, but it is probably not dangerous.

Mineral Colors, inorganic materials in the making of paint. They date as far back (or farther) in the history of coloring materials as organic materials, the paints used by primitive peoples for personal decoration being more commonly of this class. In Greek painting the main sources of coloring matters were: carbonate of chalk for whites; red and yellow ochres; and carbon. Apparently these same colors were used in Egyptian wall-painting. The range was much widened at the beginning of the Christian era at Rome, and the chemical activity of the last century has added largely to the mineral sources of colors. These may be roughly classified as follows: whites from calcium, for example, carbonate and sulphate; from barium, for example, sulphate (natural and artificial) and tungstate; from lead, for example, carbonate, hydrocarbonate, sulphate, antimonite, tungstate; from zinc, the oxide, oxychlorine, etc.; from silicum and talc; from antimony; and

MINERAL PRODUCTION OF THE UNITED STATES

from the hyponitrate of bismuth. Reds are based on iron, as sesquioxide and red ochre; on mercury; on lead, as minium; on arsenic, as arseniate of cobalt; on antimony and on gold. The greatest source of yellows is chromic acid derivatives; next the lead colors; and then the ochres, and other minor sources. Blues are derived from copper (hydrate, arseniate, carbonate), from cobalt (aluminates and silicates), and from iron (phosphates, etc.);

greens from chrome (notably sesquioxide), copper, manganese, etc.; and blacks mostly from carbons. An excellent hand-book of the subject is Perret, 'Couleurs Minérales' (1902).

Mineral Production of the United States. The mineral wealth of the United States has steadily increased in the value of the annual product so that it has for several years exceeded \$1,000,000,000 a year. The figures for 1901 and 1902 are as follows:

MINERAL PRODUCTION OF THE UNITED STATES. (First Products.)

Products	1901		1902	
	Quantity	Value	Quantity	Value
Asbestos	747 short tons	\$ 13,948	1,010 short tons	\$ 12,400
Asphaltum	20,416 short tons	337,359	29,903 short tons	389,602
Asphaltic limestone	6,970 short tons	33,375	1,859 short tons	7,782
Bituminous limestone	34,248 short tons	138,601	57,837 short tons	157,093
Barytes	49,070 short tons	157,844	58,149 short tons	186,713
Bauxite	18,905 long tons	79,914	27,322 long tons	121,465
Bismuth	319 short tons	25,488	37 short tons	2,960
Bromine	552,023 lbs.	149,045	513,913 lbs.	128,472
Calcium borate	23,231 short tons	1,012,118	17,202 short tons	2,434,994
Cement, natural	7,084,823 bbls. (300 lbs.)	3,056,278	9,083,759 bbls. (300 lbs.)	4,087,692
Cement, Portland	12,711,225 bbls. (400 lbs.)	12,532,360	16,535,000 bbls. (400 lbs.)	16,637,500
Chrome ore	498 long tons	7,740	315 long tons	4,725
Clay products	110,211,587	about 100,000,000
Coal, anthracite	67,538,536 short tons	112,704,055	41,451,267 short tons	83,002,229
Coal, bituminous and cannel	225,759,980 short tons	236,305,214	258,371,987 short tons	285,574,339
Cobalt oxide	13,360 lbs.	24,048
Copper sulphate	78,004,257 lbs.	3,674,000*	48,763,538 lbs.	2,028,563
Corundum and Emery	4,305 short tons	146,040	95,135
Feldspar	31,019 long tons	220,422	no statistics	no statistics
Fluorspar	19,586 short tons	113,803	27,127 short tons	143,520
Fuller's earth	14,112 short tons	96,835	14,100 short tons	109,980
Garnet	4,444 short tons	158,100	3,722 short tons	88,270
Gilsonite	1,500 short tons	46,000	4,052 short tons	61,182
Graphite, crystalline	3,967,612 lbs.	135,914	4,176,824 lbs.	153,147
Graphite, amorphous	809 short tons	31,800	4,379 short tons	55,964
Gypsum	659,659 short tons	1,577,493
Iron ore	27,887,479 long tons	47,408,714	34,636,121 long tons	64,769,546
Lepidolite	about 110 short tons	4,070	no statistics	no statistics
Magnetite	13,172 short tons	43,057	3,466 short tons	21,302
Manganese ore	638,795 long tons	1,644,117	no statistics	no statistics
Mica, scrap	2,165 short tons	19,719	no statistics	no statistics

Mineral Tallow (*Hatchettin*, *Hatchettite*, or *Adipocere Mineral*), a fatty mineral, 86 per cent carbon, and 14 per cent hydrogen, discovered by Charles Hatchett, English chemist, in the clay ironstone of Merthyr Tydvil. It looks like wax, is greenish yellow in color, and has a pitchy or bituminous smell when heated.

Mineral Waters, a commercial and medicinal name applied to all spring waters which possess qualities in relation to the animal body different from ordinary water. Mineral waters have been used as remedial agents from the earliest days of Greece and Rome. There were sulphurous thermal springs at Tiberius, which are still used by invalids from all parts of Syria, in cases of tumor, rheumatism, gout and other diseases. There are also warm springs at Calirrhoe, near the Red Sea, which are mentioned by Josephus as having been tried by Herod in his sickness. The Romans discovered the thermal springs in Italy, and the springs in other parts of Europe; Baden-Baden, Aix-la-Chapelle, the

Spa in Belgium, and others. Pliny mentions mineral springs in various parts of Europe.

Classification.—No classification of mineral waters based upon their chemical composition can be strictly exact, because many springs are intermediate between well characterized groups. The following classification is regarded as the most convenient: (1) Alkaline waters; (2) Bitter waters; (3) Muriated waters; (4) Earthy waters; (5) Indifferent thermal waters; (6) Chalybeates; (7) Sulphurous waters. The therapeutic action of mineral waters depends chiefly upon their chemical composition and their temperature, though other circumstances, as situation, elevation, climate, geological formation and mean temperature have an important bearing upon the success of the treatment.

Temperature.—The best time for undergoing a course of mineral waters is, in the majority of cases, the months of June, July, August and September. There are, however, exceptions depending upon climate. Early rising is usually advisable during a course of mineral waters,

MINERAL WATERS

and, as a general rule, the water should be drunk before breakfast, at intervals of about a quarter of an hour between each tumbler, moderate exercise being taken in the intervals. In many cases bathing is of even greater importance as a remedial agent than drinking. Baths are generally between breakfast and dinner, and should never be taken soon after a full meal. The time during which the patient should remain in the bath varies very much at different springs, and the directions of the local physician should be strictly attended to on this point. As a general rule, the treatment should not be protracted beyond the space of six weeks or two months, but on this point the patient must be solely guided by the physician resident at the springs. Indulgence in the pleasures of the table, and excesses of any kind, frequently counteract the salutary effects of the waters, while perfect mental relaxation is an important auxiliary to the treatment. As regards temperature, if the waters are between 70° and 98° they are called tepid, while all exceeding the latter are classified as hot springs. The following examples give the degrees of temperature found in different thermal springs: Sweet Springs, W. Va., 74°; Warm Springs, French River, Tenn., 95°; Washita, Ark., 140° to 156°; San Bernardino Hot Springs, Cal., 108° to 172°; Las Vegas, N. Mex., 110° to 140°; Sulphur Springs, Aix-les-Bains, France, 108°; Kaisersquelle, Aix-la-Chapelle, Prussia, 131°; Carlsbad, Bohemia, 162°.

American Springs.—In the United States the Rock Spring was known at Saratoga, N. Y., among the Indians as early as 1707, and over 40 springs have since been discovered there. In 1830, springs were well and popularly known in West Virginia, and of these the Bath mineral spring, now known as the Berkeley Spring, was visited as early as 1777, while the White Sulphur Springs were used by the Indians in 1778. In these American springs, like those in Europe, the geologists agree that dissolved mineral substances are obtained from the rocks through which the water has flowed. The majority of waters contain carbonic acid which greatly increases their solvent powers in the presence of lime, magnesia and iron. If the waters are alkaline they may take up substances which are ordinarily rather insoluble, such as silica. There is, undoubtedly, more or less relation between hot springs and the geological structure of a region.

Alkaline Waters.—Simple alkaline acidulous waters are composed of carbonic acid and bicarbonate of soda. The most important springs of this class are the thermal springs of Las Vegas, N. Mex., and the cold springs at Sharon, N. Y. These waters are useful in certain forms of indigestion, jaundice, gallstones, gravel, gout, and chronic catarrh of the respiratory organs. Muriated alkaline acidulous waters, which differ from the preceding, containing a considerable quantity of chloride of sodium. The most important springs of this kind are the thermal springs of Ems, and the cold springs of Selters and Salzbrunn. They are useful in chronic catarrhal affections of the bronchial tubes, the stomach and intestines. Alkaline saline waters contain sulphate and bicarbonate of soda, such as the warm springs of Carlsbad, serviceable to patients suffering from abdominal plethora, if unconnected with diseases of the heart or lungs. These waters afford an excellent remedy for habitual constipation.

Bitter Waters.—The chief contents of these waters are the sulphates of magnesia and soda. The best known springs of this class are those of Sedlitz and Kissingen; English examples are in the bitter waters of Cherry Rock, in Gloucestershire, and the Purton Spa, in Wiltshire, and in America the springs at Mt. Clemens, Mich. These waters act as purgatives and diuretics.

Muriated Waters.—Simple muriated waters contain a moderate quantity of chloride of sodium or common salt. The chief springs of this class are Wiesbaden and Baden-Baden, which are hot; and those of Kissingen, Homburg, and Cheltenham, which are cold. The muriated saline springs of Saratoga, in the United States, are some of them chalybeate, others sulphurous or iodinous; all of them being rich in carbonic acid gas. The Ballston saline springs near Saratoga have a very high proportion of carbonic acid. They are chiefly employed in cases of gout, rheumatism and scrofula. Muriated lithia waters contain chlorides of sodium and lithium. In gout they first aggravate the pain, but then give relief; and in periodic headache they have been found serviceable.

Earthy Waters.—These contain sulphate and carbonate of lime. The Wildungen water is a diuretic, and not only promotes the elimination of gravel, but by its tonic action on the mucous membrane of the urinary passages, serves to prevent the formation of fresh concretions. It is also much used for chronic catarrh of the bladder. The baths of Leuk, in which many patients remain nine hours daily, until an eruption appears, are chiefly used in chronic skin diseases.

Indifferent Thermal Waters contain a small amount of saline constituents. Of the springs of this class the most important are Hot Springs, Ark., and Roanoke, Va. Their most striking effects are to stimulate the skin and excite the nervous system. They are especially used in chronic rheumatism and chronic gout and in diseases of the skin.

Chalybeate Waters.—Simple acidulous chalybeates contain carbonic acid and bicarbonate of protoxide of iron. Saline acidulous chalybeates, contain sulphate of soda and bicarbonate of protoxide of iron. The quantity of iron present is very small—from .08 to .15 in 1,000 parts. Many of the chalybeate springs, especially in Germany, contain also much carbonic acid; carbonate, sulphate, and chloride of sodium are frequently present, and may help in the cure. The Putnam Spring at Saratoga and the springs of Maine and Massachusetts are examples of chalybeate wells which are very seldom thermal. Maine has both chalybeate and sulphurous springs. Chalybeate waters are valuable in anemia.

Sulphurous Waters.—These waters contain sulphuretted hydrogen or metallic sulphides (sulphurets), or both. The most important sulphurous thermals are those of Aix-la-Chapelle, Baden, Barèges, and Bagnères de Luchon, in Europe. There are hundreds of these sulphurous springs in the United States, including those at Mt. Clemens, Mich., Bath, Va., and Warm Springs, Va. They are extensively used in chronic diseases of the skin, and are of service in many cases in which exudations require to be absorbed, as in swellings of the joints, in old gun-shot wounds, and in chronic gout and rheumatism. The sulphurous waters are employed

MINERAL WOOL—MINERALOGY

externally and internally, and mineral mud-baths are believed by many physicians to form a valuable auxiliary.

Production.—The commercial output of mineral waters in the United States in 1901 amounted to 55,771,188 gallons, valued at \$7,586,902. The imports in the same year amounted to 2,567,323 gallons, valued at \$744,392. These figures are based on 610 springs as against 561 springs in 1900. Wisconsin, Texas, Massachusetts, New York, Michigan, California and Minnesota are the largest producing States in the order given. A number of foreign mineral waters are imported in the United States and find a large sale. Chief among these is the Apollinaris water which comes from Ahrweiler, Germany. The majority of the commercial springs of the United States are found east of the Mississippi. In the South, Kentucky, Tennessee, and Arkansas are the chief producers of mineral waters. The Hot Springs of Arkansas are among the most important thermal springs in the entire country. The Texas springs are peculiar from the fact that many of them show free sulphuric acid. In Wisconsin the springs of Waukesha are widely known. In New Mexico, the Las Vegas Hot Springs are often visited. There are no hot springs in the New England States.

Bibliography.—Althaus, 'Spas of Europe' (1862); Glover, 'Mineral Waters' (1857); Tichbourne, 'Mineral Waters of Europe' (1883); Walton, 'The Mineral Waters of the United States and Canada' (1890).

Mineral Wool, a product of molten slag, or rock under air or steam-jet, also called slag wool, rock wool, silicate cotton, cotton fibre. The result of this process is a thin vitreous fibre, useful as a non-conductor. It was first manufactured in Germany in the early 70's. In 1875 a little was made at the Greenwood iron furnace, Orange County, N. Y.; the industry was firmly established by 1885; then because of the entry into the field of rock wool, that is, a fibre made directly from the rocks and not from slag, the slag wool industry fell off. In 1902 10,843 tons of mineral wool, valued at \$105,814, was the product of the United States, a gain of more than 50 per cent over the preceding year when the product weighed 6,272 tons and was valued at \$68,992. These figures included rock and slag wools; the former command a price 50 per cent higher than the latter. The slag wools have a small percentage of sulphur, unless especially desulphurized after the slag has been re-melted, and thus sulphuric acid may be formed if water gets access to the wool and acts on the calcium sulphide in it. The sulphuric acid thus formed is injurious to the pipes. Hence rock wool is substituted for slag wool, or the slag wool is carefully desulphurized. Mineral wool of either sort, if of good grade, is one of the best practical non-inflammable coatings; as a lining for floors it has the double advantage of being sound-proof and non-conducting.

Mineralogy, the science which treats of minerals, or those inorganic portions of the earth's crust and the celestial bodies, either solid or liquid, which are homogeneous and whose composition may, therefore, be expressed by a definite chemical formula.

Scope and Utility of Mineralogy.—The researches of the mineralogist unfold to him all of

the beauties of inorganic nature; he climbs the loftiest mountain peaks to gather there the pellucid rock crystals which the ancients believed were permanently solidified ice; he descends with the miner into the depths of the earth to bring forth her precious metals; he visits the dark caverns and from beneath the slowly dropping mineral-laden waters he chisels the delicately veined and clouded Mexican onyx; in the "blue ground" in the interior of the dark continent he uncovers the sparkling diamond, while on the shores of Brazil he finds the wonderful monazite sands which the chemist has transformed into light. The mineralogist impartially records the composition and all of the properties of every mineral and thus makes available for the chemist, the inventor and the manufacturer a host of suggestive facts. It is not surprising, therefore, that new uses for minerals are constantly being discovered, indeed few are the arts to which mineralogy does not make some important contribution. The student of mineralogy is instantly charmed with the external beauties of form and color in crystallized minerals. He is soon brought to consider the still more interesting phenomena and problems connected with their internal structure. Many of the physical properties of minerals are exceedingly interesting, while chemical mineralogy opens up a wide and most attractive field for research.

History.—The mention of the precious stones in the breast-plate of the Hebrew high priest (Ex. xxviii. 17) shows that the beauties of the mineral kingdom were appreciated as long ago as 1491 B.C. There is still extant part of a work, 'On Stones,' written by Theophrastus, who died 286 B.C., while Pliny in his great work on natural history, published 77 A.D., devotes much attention to ores, metals, stones and gems. The birth of mineralogy as a science took place in the publication by Wallerius in 1747 of his systematic work on mineralogy. Steady progress has since been made, and it would be a long list indeed which would enumerate the names of even the prominent investigators each of whom has made important contributions to the science. J. D. Dana, in the various editions of his great 'System of Mineralogy,' succeeded in reviewing, revising and systematizing the work of others and adding to it the results of much original research, until now, under the no less capable authorship of his son, E. S. Dana, this work is the accepted standard all over the world. Much valuable work has recently been done, chiefly by German investigators, in physical mineralogy, especially in connection with the optical properties of minerals. The present great activity in mining and the growing appreciation of gems and decorative stones, stimulates and often rewards the search for new and interesting minerals. The introduction of the study of elementary mineralogy into many public and private schools is evidence that educators are beginning to appreciate the mental training which it brings, as well as the far-reaching importance of the mineral industry which now enters so largely into every-day life.

Mineralogy is usually considered under the following divisions: (1) Crystallography. (2) Physical Mineralogy. (3) Chemical Mineralogy. (4) Descriptive Mineralogy.

Crystallography.—Most minerals in the pro-

MINERALOGY

cess of solidifying from the liquid or gaseous state, or from solutions, assume certain characteristic forms, with definite molecular structure. These are called crystals. It is the present theory that a crystal is the result of an attraction between its molecules exerted in certain fixed directions. (See MOLECULAR THEORY.) As long ago as 1669 the Danish geologist, Nicolaus Steno, proved that while the faces of quartz crystals may vary greatly in their relative sizes, the angles between like faces are constant. In 1704 Dominico Gulielmini advanced the theory that the interfacial angles were constant in all salts and that each had its own form. Near the close of the 18th century Romé de l'Isle first formulated the present law of the constancy of interfacial angles. After examination and measurement with a contact goniometer of a very large number of crystallized minerals and salts, he announced that each could be referred to its own characteristic primitive form, that all crystals of the same substance either had the constant angles of the primitive form or were bounded by secondary faces bearing fixed relations to the primitive form. Abbé

variations in the size of the faces and in their distances from the plane of symmetry do not destroy their symmetry, because their interfacial angles are not changed. Cuprite, for example, occurs in cubes and also in needle-like crystals which careful examination shows are simply cubes enormously elongated in one of the axial directions. As it can be proved by physical tests that the molecular structure is identical in each of these forms of cuprite, the crystallographer does not consider that distortion destroys symmetry. In studying the relations of the faces of crystals the existence is assumed of certain fixed lines of reference called axes. The crystal faces intersect these axes and by measuring the interfacial angles the proportionate lengths of the axes can be calculated. These lengths are known as the axial ratio. The law of rational intercepts, which is one of the foundation stones of crystallography, asserts that any face of a crystal, extended if necessary, will cut the axes at distances which can be expressed by simple multiples or fractions of the axial ratio. For example, the primitive rhombohedron of calcite, r (see Figs. 1, 2, and 3), cuts the

FIG. 1.

FIG. 2.

FIG. 3.

Haüy, about 1784, discovered that even the most complex crystal forms could be reproduced by the addition to the primitive form of successive layers of minute primitive forms, each layer containing a uniformly smaller number of rows than its predecessor. From these observations he concluded that crystals were formed of minute particles each having the primitive form and all symmetrically arranged. Whether his hypothesis of the shape of the molecules be true or not, all crystallographers are agreed that a definite molecular structure is essential to the existence of a crystal. The molecules are assumed to be almost infinitely minute, for the surfaces of crystals, even when viewed with the highest powers of the microscope, appear perfectly smooth. It seems certain also that the molecules are not in contact with one another, but are separated by distances probably as great or even greater than their diameter, for only thus could heat and light waves be transmitted through them. The particular form which a crystal assumes is determined by the manner in which the molecules group themselves in response to the intermolecular forces. These forces vary greatly in intensity and direction and thus produce the different types of crystals. Examination of a large number of crystals shows that most of them exhibit distinct symmetry. As the symmetry of faces is but the external manifestation of the internal molecular structure,

vertical axis at the unit distance; the rhombohedron c at half the unit distance, while the rhombohedron f cuts it at twice the unit distance. Prof. W. H. Miller of Cambridge University in 1839 expanded Whewell's application of spherical trigonometry to crystallography and deduced a method of designating the relative positions of the faces by certain simple indices. Miller's system of notation is very extensively used and is gradually supplanting other more complex systems.

Though the variety of crystal forms is almost endless, they are all embraced in one of the six systems of crystallization whose relations are as follows:

(A) CRYSTALS HAVING 3 AXES.

I. AXES AT RIGHT ANGLES.

1. *Isometric System.* Axes all of same length.
2. *Tetragonal System.* Two axes equal, third longer or shorter.
3. *Orthorhombic System.* Axes all of different lengths.
- II. ONE AXIS OBLIQUE TO OTHER TWO.
4. *Monoclinic System.* Axes all of different lengths.
- III. ALL AXES OBLIQUE TO EACH OTHER.
5. *Triclinic System.* Axes all of different lengths.

(B) CRYSTALS HAVING 4 AXES.

6. *Hexagonal System.* Three axes of equal length and intersecting each other at equal angles; fourth axis at right angles to other three.

A twin crystal is one in which one of the halves of a single crystal, or one of two whole

MINERALOGY

crystals, appears in a position exactly reversed in reference to the other half or the other crystal, as though it had been revolved exactly 180° usually on or parallel to one of the simple faces of the crystal, called the twinning plane. Contact twins generally appear like the reversed halves of a single crystal, as seen in figures 4 and 5. This form, known as the spinel twin, is

FIG. 4.

FIG. 5.

common with spinel and diamond and is occasionally seen in magnetite. Penetration twins result from the union of two complete crystals by the revolution of one on the twinning axis through 180° . One of the commonest illustrations is the Carlsbad twin of orthoclase, figure 6. Eleven distinct types of twinning are known in orthoclase. Among the triclinic feldspars polysynthetic twinning is very common. This is a repeated twinning, usually of lamellae so thin as to manifest their presence only by fine striations.

While crystals usually occur isolated or in irregular clusters, they are frequently found grouped in parallel position, as shown in figure 9 of amethyst from Montana.

FIG. 6.

FIG. 7.

The surfaces of crystals are sometimes covered with parallel lines called striations. These lines are really alternate furrows and ridges and are symmetrically arranged in reference to the edges of the crystals. They are due to a conflict between the crystallizing forces which results alternately in one face and then another. The result is this "oscillatory combination" of small faces. Pyrite cubes (figure 7), also quartz, calcite, tourmaline and many other species, often show these striations. Curvature of the crystal

faces often results from this oscillatory combination, as in many calcites from Joplin, Mo., but curvature is also produced by pressure, as in twisted stibnite and quartz crystals, or from certain intermolecular forces, such as those which produce the beautiful arborescent frost crystals often seen on windows or stone walks, as well as the nearly spherical diamonds of Brazil and South Africa and the peculiar forms of gypsum found in the Mammoth Cave, figure 14. Liquid and gaseous inclusions often manifest their presence by moving bubbles. Enclosures of other minerals, such as needles of rutile and tourmaline, are very varied.

Usually the conditions coincident with the formation or deposition of minerals have been such that only confused crystalline masses have been produced. Such aggregates are shown by the structure of the mineral and include (1) Columnar and fibrous, respectively denoting coarse or fine fibres, examples of which are furnished by some tremolite and by cyanite (bladed-columnar) and asbestos. Stelated (e. g., wavelite) and radiated (e. g., pectolite) are varieties of fibrous aggregates. (2) Lamellar, in plates, e. g., selenite. Under this are included concentric, the plates circling crudely around a common centre, e. g., malachite and some banded agate. Foliated, the plates thin and separable, e. g., foliated talc. Micaceous is the most perfectly developed type of a foliated structure. (3) Granular, including coarse-granular, e. g., Tuckahoe dolomitic marble; fine-granular, e. g., Carrara statuary marble; impalpable, e. g., lithographic limestone.

Linking crystallized with amorphous minerals are the many interesting imitative forms, a few of which are: reniform, kidney-shaped, e. g., hematite variety kidney ore, figure 10; botryoidal resembling a cluster of grapes, common in limonite, chalcidony, psilomelane; globular or spherical, e. g., pectolite, hyalite; nodular, e. g., flint; oolitic, in masses of small concretions resembling a fish's roe, e. g., oolite; dendritic and arborescent, in tree-like forms, e. g., wad, figure 12; reticulated, net-like, usually due to twinning, e. g., cerussite, figure 16; coralloidal, resembling coral, e. g., aragonite variety flos-ferri.

When one mineral exhibits the characteristic form of another it is known as a pseudomorph after the original mineral; thus quartz (a rhombohedral mineral) appearing in cubes which were originally fluorite is called quartz pseudomorph after fluorite. Pseudomorphs are formed, 1. By a change in chemical composition, e. g., limonite (hydrated iron sesquioxide) pseudomorph after pyrite (iron disulphide). 2. By substitution, e. g., cassiterite after orthoclase, also silicified wood, in which the original wood has been replaced by silica. 3. By incrustation, as in the coating of various objects by the hot springs in the Yellowstone Park.

Physical Mineralogy.—The external form of crystals has been shown to be due to the existence of a definite, internal, molecular structure. Physical mineralogy aims to explain the phenomena observed in connection with this structure.

MINERALOGY

1. Characters Due to Cohesion and Elasticity.

— Cohesion is the force which holds the molecules of a homogeneous substance together. Elasticity is the force which tends to bring the molecules when separated back to their original position. These forces manifest themselves in the properties of cleavage, fracture, tenacity, hardness, etc.

(a) Cleavage is the tendency of certain crystallized minerals to break in definite directions, invariably parallel to one or more of the simpler faces of the crystal. In the isometric system cubic cleavage is well illustrated by halite, figure 13; octahedral cleavage by fluorite and diamond; dodecahedral, by sphalerite. In the tetragonal system basal cleavage is shown by apophyllite, prismatic by rutile and wernerite. In the orthorhombic system, topaz has marked basal cleavage, while barite cleaves readily parallel to the prism. In the monoclinic system clinopinacoidal cleavage is exhibited by orthoclase and selenite, basal by the micas and orthoclase, prismatic by amphibole. Pinacoidal cleavage in the triclinic system is prominent in anorthite, albite and rhodonite. In the hexagonal system basal cleavage is shown by beryl, prismatic by nephelite, rhombohedral by calcite and dolomite. Cleavage is one of the most important aids to the mineralogist in the determination of unknown minerals by physical tests and it often enables him to recognize at a glance the crystal system of the mineral. Parting is separation along secondary twinning planes and much resembles cleavage. Pyroxene is a good illustration, figure 8.

FIG. 8.

(b) Fracture is the break of minerals other than cleavage and parting. It is most noticeable when it is conchoidal or shell-like. This fracture which is quite common among minerals is illustrated by figure 11 of uinthalite. A hackly or jagged fracture is shown by copper and other native metals. Wollastonite often well illustrates a splintery fracture.

(c) The hardness of a mineral is its resistance to abrasion, or the resistance which its molecules offer to a body trying to push them into a new position. It is usually, though very crudely, determined by comparison with the following Scale of Hardness introduced by Mohs: (1) Talc; (2) Selenite; (3) Calcite; (4) Fluorite; (5) Apatite; (6) Orthoclase; (7) Quartz; (8) Topaz; (9) Corundum; (10) Diamond. While Mohs' scale is universally used

in all mineralogical works, various methods have been adopted to determine the absolute hardness (see SCLEROMETER). Hardness is often one of the most conclusive tests in identifying minerals by their physical properties.

(d) The tenacity of a mineral is the resistance which its molecules offer to an effort to completely separate them. When this resistance is but slight the mineral is termed brittle; if it is stronger so that shavings may be cut off with a knife, but the shavings can be powdered by a hammer, it is called sectile, e. g., talc. Malleable minerals exhibit still greater tenacity, as shavings are not powdered by the blow of a hammer. The native metals, copper, gold and silver, are malleable and also ductile, that is, capable of being drawn out into wire. Flexible minerals are those which can be bent, but in which the force of cohesion is not strong enough to cause the molecules to return to their original position, e. g., foliated talc.

(e) Elasticity in minerals not only involves resistance of their molecules to complete separation, but indicates such a development of cohesion as to prevent a permanent bending of the specimen and lead to its return to its original position when the disturbing force is removed. The micas exhibit this property to a marked degree.

2. *The Specific Gravity* of a mineral is the ratio of its weight to the weight of an equal volume of water. It is dependent upon the weight of its molecules and the closeness of their aggregation. Corundum, a compound of the exceedingly light metal aluminum with the gas oxygen, nevertheless is comparatively heavy, having a specific gravity of 4. As a single molecule of Al_2O_3 must be relatively light, it follows that corundum is heavy because its molecules are closely aggregated. This will become clear by comparing a cubical box with a single wooden sphere at each corner, to the same box filled with such spheres and imagining that these spheres represent the closely crowded molecules of aluminum in a cubical piece of corundum. The filled box would manifestly be very much heavier, but it would not be nearly so heavy as it would be if the spheres were of lead instead of wood. The average specific gravity among common minerals being about 2.7, any mineral whose specific gravity is considerably greater than 2.7 seems heavy when placed in the palm of the hand. The metals and metallic minerals and most of those minerals which are compounds of the heavier metals have a high specific gravity. Iridium (22.75) is the heaviest; gold and platinum also have a very high specific gravity, ranging from 14 to 19. Very few minerals exceed 10 and all of them are metallic. The specific gravity of a mineral is a property of greatest importance because it is subject to such slight variations unless the material is impure or contains cavities.

3. *Characters Depending Upon Light.*—The optical characters which are common to both crystallized and amorphous minerals include chiefly diaphaneity, color, lustre, asterism, fluorescence and phosphorescence.

Diaphaneity or transparency is the quantity of light which a mineral transmits. If a mineral offers but little if any resistance to the passage of light, that is to say, when all the details of an object can be readily seen through

MINERALOGY

it, it is described as transparent, e. g., rock crystal. If, on the other hand, a mineral permits no light to traverse it, and it is, therefore, impossible to see any object through it, it is called opaque, e. g., jasper. Between transparent and opaque minerals are those which are translucent, e. g., chalcedony, in which light is transmitted, but objects cannot be seen. Very many substances ordinarily perfectly opaque appear translucent or even transparent in very thin sections, e. g., gold.

The color of a mineral is the kind of light which it either transmits or reflects. If transparent a mineral may transmit one kind of light and reflect another; hematite, for example, ordinarily appears black by reflected light, but on looking through thin crystals they appear red. Some minerals transmit different colors in different directions (see *DICHOIC CRYSTALS*). The external or superficial colors are those which first appeal to the eye, but they are not usually of great importance because not constant. The essential color or streak of a mineral, which is the color of the mineral when powdered, is a character of first importance because it varies but little regardless of what the external color may be. Play of colors, change of colors, iridescence, tarnish and opalescence are properties whose study is full of interest.

The lustre of a mineral is the manner in which it reflects light. According to its intensity it is said to be splendid, shining, glistening, glimmering, or, if devoid of lustre, dull. In describing its quality minerals are separated into metallic, sub-metallic and unmetallic. Metallic minerals, of which galena is a good illustration, are not considered to possess a metallic lustre unless they are opaque. The unmetallic minerals are further divided into adamantine, the lustre of the diamond; vitreous, glassy, e. g., rock crystal; resinous or waxy, e. g., sulphur, amber; greasy, e. g., elaeolite; pearly, e. g., brucite; metallic-pearly, e. g., bronzite; silky or satiny, e. g., chrysotile, satin spar. Lustre is a quality of considerable importance, the first step in the determination of minerals being to decide whether or not they possess a metallic lustre.

Asterism is the property of showing a six-rayed star either by reflected or transmitted light. Star-mica and star sapphire, figure 15, are the best illustrations.

Fluorescence is the property of emitting from within light of one color during exposure to light of other colors, or to the emanations from radium. Fluorite has long been cited as the most prominent illustration of the property, but recent investigations with ultra-violet rays have shown that willemite from Franklin Furnace, New Jersey, is more magnificently fluorescent when exposed to ultra-violet rays than any other known mineral. Some calcite from Franklin Furnace and from Longban, Sweden, shows a charming rose pink fluorescence under the ultra-violet rays. This property seems to be due to a transformation of the rays within the mineral and their emission as light of greater wave length. See *FLUORESCENCE*.

Phosphorescence is the property of emitting light for a time after gentle heating or after exposure to radium, an electrical discharge or to light. The ultra-violet rays are especially powerful in exciting phosphorescence. Fluorite exhibits both fluorescence and phosphorescence,

but many fluorescent minerals do not phosphoresce. Some New Jersey willemite is magnificently phosphorescent after exposure to the ultra-violet rays. Kunzite glows with a rich red light after excitation by the ultra-violet or the Roentgen rays. Many other minerals, including diamond, wollastonite, pectolite and all the minerals from Borax Lake, Cal., exhibit phosphorescence. Phosphorescence is explained by the transformation into light of the energy communicated to the body by some exciting agent. (See *PHOSPHORESCENCE*.)

In the more advanced study of mineralogy very great importance is attached to the consideration of the optical characters of crystals. The crystal system and even the identity of the mineral species may often be determined by an examination of its optical characters. Isometric crystals have like optical properties in all directions and are, therefore, called isotropic. The optical properties of all other crystals are unlike in different directions and they are consequently called anisotropic. Anisotropic crystals are subdivided into two groups, isodiametric, including crystals of the tetragonal and hexagonal systems, and anisometric, including crystals of the orthorhombic, monoclinic and triclinic systems. In isodiametric crystals there is no double refraction in the direction of the vertical crystallographic axis, which is called the optic axis; these crystals are consequently said to be uniaxial. The optical structure of uniaxial crystals is represented by a spheroid, a section of which normal to the optic axis is always a circle. Anisometric crystals are more complex, but there are always two directions analogous in character to the single axis of the uniaxial group, so that anisometric crystals are said to be biaxial. Their optical structure is represented by an ellipsoid with three unequal rectangular axes. There are two directions in which such ellipsoids can be cut so as to yield cross sections which are circles. The optic axes are normal to these planes. In orthorhombic crystals the axes of the ellipsoid coincide in direction with the crystallographic axes. In monoclinic crystals one of the ellipsoidal axes coincides with the axis of crystallographic symmetry, while the other two lie in the plane of symmetry. In triclinic crystals there is no essential relation between the ellipsoidal and the crystallographic axes. When examined in polarized light isometric crystals exhibit no special phenomena. (See *PHYSICAL CRYSTALLOGRAPHY*.)

4. *Characters Depending upon Heat*.—Fusibility is the relative ease with which a mineral melts. Mercury, water and petroleum are the only minerals which are liquid at ordinary temperatures of the atmosphere. Von Kobell's scale of fusibility is 1. Stibnite, fusible in a candle flame, even in large pieces. 2. Natrolite, fusible in a candle flame, but only when in small splinters. 3. Almandite Garnet, easily fusible in the blowpipe flame, even in large pieces. 4. Actinolite, fusible with difficulty in the blowpipe flame in large pieces. 5. Orthoclase, fusible with difficulty in the blowpipe flame, even when in small splinters. 6. Bronzite, scarcely fusible at all. The determination of the fusibility of a mineral is frequently of aid in its identification.

Other minor characters depending upon heat are conductivity, expansion, specific heat and diathermancy.

MINERS — MINERSVILLE

5. Electricity and Magnetism.—Electricity is developed in all minerals by friction, though in greatly varying degrees. If both positive and negative electricity are developed in a crystal by a change in temperature it is said to be pyro-electric, e. g., if tourmaline be heated it becomes differently electrified at opposite terminations. Electricity developed in a crystal by pressure is termed piezo-electricity.

Magnetism manifests itself among minerals in two ways: (1) A few minerals are attracted by a magnet. This attraction is very much stronger in the case of magnetite than any other mineral, but pyrrhotite and platinum are also slightly magnetic. (2) These same minerals are sometimes natural magnets, exhibiting polarity and attracting iron or magnetite. Lodestone is a variety of magnetite which possesses this property to a very marked degree. The attraction of the electro-magnet for minerals containing iron has a very important commercial application in concentration of low grade iron ores.

6. Taste, Odor and Feel.—Taste is a property present only in minerals which are soluble. Salt is the commonest mineral having a decided taste, known as saline. Among rarer minerals, epsomite is said to be bitter, nitre is cooling, chalcantite is metallic, melanterite is astringent, trona is alkaline.

Odor is not emitted by minerals as found in nature, except by the hydrocarbons, many of which have a bituminous odor. It is, however, developed in many minerals by friction, or heat, or by breathing on them.

Soft minerals generally have a smooth or greasy feel, e. g., sepiolite and talc; minerals with a hackly fracture feel harsh, e. g., copper.

Chemical Mineralogy.—The chemical composition of a mineral is its most important characteristic. It is, therefore, essential that the student of mineralogy should have some knowledge of the fundamental principles of chemistry (q.v.). Chemical mineralogy includes the determination of the composition, chemical properties and proper grouping of minerals and the methods of distinguishing the various species. All of the eighty or more elements are found in minerals, but only about eighteen of them occur in nature uncombined. They are grouped into metals and non-metals. Nearly all mineral species are compounds of one or more metals with one or more of the non-metals. The simplest of these compounds consist of the metallic elements combined with oxygen (oxides), sulphur (sulphides), arsenic (arsenides), or some similar non-metallic or semi-metallic elements. A few acids and bases (see CHEMISTRY) occur among minerals, but about three fourths of all described mineral species are salts, or compounds of acids and bases. The chief salts occurring among minerals are the chlorides, carbonates, sulphates, phosphates, arsenates and silicates, the last being by far the most numerous. It is one of the charms of the study of mineralogy to note the relationships existing between the various groups. The blowpipe (q.v.) is a most important aid in identifying minerals by determining their component elements (see BLOWPIPE ANALYSIS). In order to ascertain the exact chemical composition, which is essential in describing a new mineral, a complete quantitative analysis is requisite (see CHEMICAL ANALYSIS).

The recent production, in the laboratories of French chemists, of crystals having the same chemical composition as the natural minerals, is of very considerable interest as throwing light on the methods by which minerals, such as diamond, may have been formed in nature. Most of the common minerals have been duplicated by these so-called "artificial minerals," while artificial rubies of great beauty (see RUBY) are commanding high prices.

Descriptive Mineralogy.—The proper description of minerals may be briefly summarized as including (1) classification; (2) form and structure; (3) physical properties; (4) chemical composition; (5) distinguishing characters; (6) occurrence.

Various schemes of classifying minerals have been proposed, one of the most popular being the grouping under their most prominent metal. The only one which is strictly scientific is that which arranges similar compounds together in one class, further classifies them according to the minor relations between them, and then by their crystal form and other physical properties. This scheme, which is now almost universally adopted, is as follows:

SCHEME OF CLASSIFICATION.

- I. Native Elements.
- II. Sulphides, Selenides, Tellurides, Arsenides, Antimonides.
- III. Sulpho-salts.—Sulpharsenites, Sulphantimonites, Sulphobismuthites.
- IV. Haloids.—Chlorides, Bromides, Iodides, Fluorides.
- V. Oxides.
- VI. Oxygen Salts.
 1. Carbonates.
 2. Silicates.
 3. Niobates, Tantallates.
 4. Phosphates, Arsenates, Vanadates, Antimonates, Nitrates.
 5. Borates.
 6. Sulphates.
 7. Tungstates, Molybdates.
- VII. Salts of Organic Acids.—Oxalates, Mellates, etc.
- VIII. Hydrocarbon Compounds.
